Public Enterprises and Bureaucracy

THIS has reference to Ramaswamy R Iyer's comments (August 20, 1994) on my paper on 'Public Enterprises and Private Purposes' (May 28, 1994). I have read with interest his ideas on PEs particularly because he was a senior bureaucrat at the ministry of chemicals and fertilisers. I address myself below to those aspects which specifically concern my paper.

(1) Considerable space in his note is devoted to an explanation of the problems of Fertiliser Corporation of India (FCI). That was not my objective. I used Planning and Development Division of FCI (P and D) merely as an example to show how "lack of proper planning, lack of support, indifference and even active opposition prevented the full indigenous potential from being realised". I have no comments to offer on the unsubstantiated/irrelevant observations made by Iyer, e.g., "FCI/P and D had many excellent engineers but relatively few good managers"; "I knew the FCI very well in those years, and while it had many excellent people (with several of whom I formed friendships that have lasted down the years), it was a disaster as an organisation", etc. If one concentrates on the facts presented by him, then it can be seen that these actually support my propositions. Let me give one example. Iyer mentions the "ambitious attempt on the part of the FCI to take on several projects at the same time or in quick succession...". I also referred to this in my paper, and used it as an example of the lack of proper planning which adversely affected the performance of P and D.

(2) In several places in his note Iyer has pointed out that even if some of the decisions taken by bureaucrats are now considered to be wrong, these decisions were taken in good faith – their motivations were not improper. It is possible that Iyer is correct, though there is no way of knowing this from his note. Consider, for example, Iyer's opposition to my remarks on the decision to go in for 1,350 TPD capacity plants and bypass P and D. All that he says is that "the then secretary (C and F) agonised for a long period over the choice...". In view of the statistics cited in footnote six in my paper that at 80 per cent capacity utilisation, smaller capacity plants of 900-1,000 TPD would be more cost effective and internationally 1,350 TPD plants were not yet the standard size,

accounting for only 25 per cent of the plants in the world, I do not think it was improper on my part to question the motivation of the decision in terms of its impact on indigenous R and D. If the decision-makers were genuinely bothered about indigenous efforts, then the benefit of doubt should have been given to P and D, which actually was not done. However it is possible that the bureaucrats in question genuinely believed that P and D should not be promoted. In that case, their honesty is of course not in doubt.

(3) My statement, "thanks ultimately to the support of some senior bureaucrats and technocrats, some of whom later joined organisations like Bechtal and the World Bank..." was prompted by the fact that an influential chief of a public sector engineering consultancy firm joined Bechtal. However a bureaucrat/technocrat need not necessarily join an organisation to serve its interests. Hence deleting the above-mentioned statement from my paper does not disprove the point in question.

(4) Iyer contests my observation on the lack of planning for the public sector as a whole. He has missed my point. I did not say that while deciding on a new public investment project, its impact on the economy, on imports, etc., are not analysed. (The efficiency with which these are done can be questioned but that is a different matter.) What I meant was that there is no forum where a public sector project is evaluated from the point of view of the impact on the operations of the public sector as a whole. I gave the example of the rail coach factory at Kapurthala to argue how expanding/diversifying some existing PEs would have been more profitable than setting up a greenfield project. The reports of the Project Appraisals Division of the Planning Commission, which Iyer mentions in his note and I also referred to, does not consider, for example, whether capacities set up for particular purposes and at present underutilised can be utilised for the new investments proposed.

SUDIP CHAUDHURI

Calcutta

Archaeology Conference

IN his article 'Recovering, Uncovering or Forfeiting the Past' (November 19, 1994) among other things, Gautam Navlakha questions the ethics of Indian archaeologists who unlike their historian colleagues have done little to protest against the destruction

of the Babri masjid. Throughout his indictment, Navlakha quotes from several sources and provides the necessary references – with some conspicuous lapses. One of these concerns me directly.

Navlakha refers to correspondence which he labels 'a communication' from Peter Ucko. He also refers to something Jack Golson 'wrote'. Navlakha quotes extensively from these two sources but neglects to state what they are or the specific context in which they were written. These 'communications' are letters that Ucko and Golson wrote me earlier this year. These were in response to my plea that action be taken regarding the fact that the WAC, which stands for the breaking of hegemonic domination in archaeology and a more critically self-conscious and reflexive undertaking of academics, had been taken over by people known to be involved in the abuse of archaeology for political ends and in the chauvinistic and selective rewriting of the past.

I had circulated Ucko's and Golson's letters and other related correspondence to some archaeologists and historians so that the issue could be discussed comprehensively. It is rather ironic that Navlakha, in writing so ably about ethics, found it necessary to publish extracts from this correspondence without either citing the specific context within which it was written or getting in touch with me. I trust that Navlakha at least sought permission from Ucko and Golson to quote from their letters.

NANDINI RAO

Madras

[Gautam Navlakha writes:

Nandini Rao is correct that the quotations from Peter Ucko and Jack Golson in my article were taken from the correspondence between them and her. However, the correspondence was widely circulated and that is how they reached me. What I cited were portions of direct relevance to the issue I was discussing. They dealt with a matter of public concern and therefore reference to them needed nobody's permission. It is also necessary to point out that WAC-3 was provided large public funds. Besides, there was no sweeping condemnation of archaeologists in my article. The critical remarks pertained to organisations and associations for being unprepared and for starting so late in the day with their campaign against the pro-RSS archaeologists.]

By Stealth

THE government has been fond of claiming that it has successfully built a national consensus on its economic policies when, in fact, it has consistently fought shy of engaging in any form of discussion and consultation with its critics, including the opposition political parties in parliament which among them today command the support of a far larger proportion of the electorate than does the ruling party. In the case of India's membership of the World Trade Organisation (WTO), the just-established successor to GATT following the Uruguay Round of trade negotiations, the government has carried this penchant for ignoring all opinion other than its own to the point where it has not hesitated to throw constitutional proprieties to the wind. In a premeditated ploy to bypass parliament, it waited for parliament's winter session to end and then, just days later, took brazen recourse to ordinance raj to amend the patents and customs laws to make them conform to the requirements of the WTO. The government authenticated the Uruguay Round agreement at Marrakesh in April last year and there was ample time and opportunity for parliament to discuss the consequential legislation, especially the vital bill to amend the patents act which would have far-reaching implications. Instead what we have now are the two ordinances presented to the president for his signature at the very last moment.

The government's unwillingness to face parliament reflects not just basic contempt for democratic procedures or even its apprehension, given that it does not command a majority in the Rajya Sabha, that the necessary parliamentary approval might not be forthcoming. Above all, a debate in parliament would have exposed the lies and deceptions which ministers and other official spokespersons have been freely dispensing in the attempt to play down the enormous compromises which this government – anxious to crawl when it was perhaps required merely to bend, to employ an expression very popular once in a different context – was led to make in the Uruguay Round negotiations. In the specific case of the law on patents, the government has been claiming all along that the country had nothing to worry about immediately since India, as a developing country, would have the benefit of a 10-year transition period before having to accept product patents in pharmaceuticals and agricultural chemical products. However, as the ordinance to amend the patents act now makes all too clear, the so-called transition period amounts to very little because (1) the country has to put in place a mechanism for receiving applications for product patents immediately from the date of coming into force of the WTO agreement, that is, January 1 this year; and (2) once a product is the subject of a patent application, the applicant will have

the right of exclusive marketing of the product, which for all practical purposes will be as good as product patent protection. Transnational pharmaceutical and agricultural chemical companies should be expected to immediately file applications for product patents here, gaining in the process the exclusive right to market the concerned products in India and putting paid to the erstwhile patents law's goal of encouraging the development of competing products through multiple processes. The implications for domestic industry and for Indian consumers in terms of the prices of advanced life-saving drugs, whose manufacturers will gain monopoly marketing rights rightaway and full-fledged product patent protection in due course, should not be too difficult to imagine.

The text of the ordinance on the patents law refers to an expert group set up to suggest amendments to the law "to comply with our obligations and also to safeguard our interests". In keeping once again with this regime's ways of working, the recommendations of the group have not been made public and the opportunity for an informed public debate on the minimum changes called for in the existing patents law has been lost as a result. Was it really necessary, in amending the patents act, to go the whole hog as the government has done or were there, as was suggested by G V Ramakrishna, member of the Planning Commission, in a recent address to the Indian Drug Manufacturers' Association, grey areas which could have been left to adjudication in due course by the WTO's disputes settlement mechanism? More important, having in its wisdom come to the conclusion that there was no alternative to opening the floodgates to product patents, it was incumbent upon the government at least to initiate some advance action to meet the consequences of the change – for instance, once again as pointed out by Ramakrishna, in terms of providing institutional and financial support to the Indian pharmaceutical industry to file patent applications and defend them in other countries and to defend Indian applications and challenge foreign applications wherever warranted with the Indian patents authorities or of strengthening the R and D effort of the Indian industry, especially in developing patentable medicinal and bio-genetic products, which are sure to be prime targets of the drug multinationals, given the rich variety of bio-genetic material available in our country and the large number of medicinal substances used in traditional medicines. However, from all available evidence, such matters are far removed from the government's current concerns. And so if a charge even more serious than that of duplicity and deceit could be brought against it, that should be one of complacency and incompetence.

CURRENT STATISTICS

EPW Research Foundation

Equity prices have of late experienced a precipitate decline. While three months ago the BSE's Sensex was ruling 75 per cent above the level 12 months earlier, the rise over 12 months is now only 7 per cent. The powerful corrective factors now in operation are sure to depress equity prices further in the coming weeks. Waning of FIIs' interest in Indian equities, the stoppage of renewal facility for non-specified shares, the absence of an alternative to badla trading, stricter norms with regard to segregation of brokers' and clients' accounts, insistence on proper end-use of GDR funds raised abroad and the large primary issues in the offing have all affected liquidity and contained trading in the secondary markets.

Thermax

ESTABLISHED in 1966 as Wanson (India) Pvt. the company was amalgamated with Thermax India (Private) in 1980, changing its name to Thermax Pvt. The company is one of the leaders in the hi-tech and hi-growth areas of energy and environment. A multi-product, multi-division company, it is engaged in the manufacture of industrial boilers, energy conservation equipment, absorption chillers, water treatment plants and air pollution control and specialty chemicals. The focus is being laid on new high potential areas of cogeneration and captive power, absorption cooling and waste management. The company has a chemical manufacturing facility at Bhosari in Pune. A new state-of-the-art plant has been set up in Khopoli to double the manufacturing capacity. Apart from these, the company is into electronics, post-harvest technology and control and automation equipment. The company has collaboration with reputed multinationals like Babcock and Wilcox, General Electric, Struthers and Bertram. Besides having a number of patented products to its credit, Thermax has state-of-the-art products in fluid bed combustion, direct fire chilling, hi-efficiency burners, nuclear grade resins and flow improvers. The company has a strong marketing network and its exports were Rs 46 crore last year. It has been the recipient of the EEPC Export Award every year since 1988-89. Thermax is entering the capital market with a public issue of 61,12,500 equity shares of Rs 10 each at a premium of Rs 180 per share aggregating to Rs 11,613.75 lakh. The proceeds of the issue are to be used for part financing the modernisation and expansion of its facilities at Chinchwad and its chemicals division at Khopoli. Part of the finance would be invested on the Research Centre for Energy and Environment at Chinchwad. The company also plans to repay loans/deferred credit and fixed deposits of Rs 5.93 crore. The project has been appraised by ICICI and the total cost is estimated to be at Rs 12,038 lakh. The company has internal accruals to the tune of Rs 424 lakh and the public issue would fetch Rs 11,614 lakh which adds up to the estimated cost of the project. The issue is slated to open soon and is being lead managed by Enam Financial Consultants and ICICI Securities and Finance Company.

Indian Dyestuff Industries

Indian Dyestuff Industries, the flagship company of the Sun-Grace-Malatlal Group, is engaged in the manufacture of

a wide range of dyestuffs, pigments, optical whiteners, dye intermediates and industrial chemicals. The company is entering the capital market on January 19 with a public issue of 73 lakh equity shares of Rs 10 each at a premium aggregating Rs 5,919 lakh comprising 29,60,000 equity shares at a premium of Rs 80 per share to FIIs/FIs/MFs on firm allotment basis and 43,40,000 equity shares at a premium of Rs 65 per share to the public and permanent employees. The company plans to modernise its existing manufacturing facilities. The proceeds of the issue are to be used for the modernisation programme and to liquidate a part of high cost short-term borrowings. The company does not have any brand of its own but nevertheless has a number of registered trade marks. It has an established marketing network. The issue is to be lead managed by DSP Financial Consultants.

Southern Fuels

Southern Fuels, promoted by the Chachanis, is engaged in coke and coal mining business. The company proposes to set up a new plant in the at Sipcot Industrial Area in Tamil Nadu for the manufacture of 24,000 tonnes per annum of low ash metallurgical coke from imported coking coal by using the beehive coke oven technology. This is the first project of its kind in south India. The raw material required for the project is to be imported from Australia. For this the company has entered into an agreement with Glencore International AG. The project has been appraised by IDBI and the cost is estimated to be at Rs 6.5 crore. IDBI is participating in the project by granting a term loan of Rs 275 lakh. To part finance the issue the company is entering the capital market with a public issue of 18 lakh equity shares of Rs 10 each at par aggregating Rs 180 lakh. The net

offer to the public would be of 11,54,500 equity shares of Rs 10 each at par aggregating Rs 115.45 lakh. The project being located in a state notified backward area, the company is entitled to a state subsidy of Rs 20 lakh. The issue is slated to open on January 18 and the issue is being lead managed by Kotak Mahindra Finance.

Reliance Capital

Reliance Capital and Finance Trust is promoted by Reliance Industries (RIL). The company is an accredited category I merchant banker and a member of OTCEI. At present the company is involved in fund-based activities like leasing, investment banking, securities trading, market making, bills discounting and intercorporate deposits. Its fee-based activities are underwriting, issue management and corporate advisory services. The company is now expanding its activities into leasing, bill discounting, merchant banking and securities trading including market making at the OTCEI. It is entering the capital market on January 16 with a public issue of 4,28,57,200 equity shares of Rs 10 each at a premium of Rs 130 per share aggregating Rs 600 crore. Of this issue the net offer to the Indian public would be of Rs 161,79.38 lakh. The issue is being made to finance its growth and diversification and to strengthen its equity base and net worth and thus enhance its ability to leverage. Part of the funds would be used for purchasing property. Some of the company's funds would also be deployed to its subsidiaries. The issue is to be jointly managed by ICICI Securities and Finance, SBI Capital Market, J M Financial and Investment Consultancy Services, Jardine Fleming India Securities, Enam Financial Consultants, Canara Bank, PNB Capital Services and Deutsche Bank.

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the EPW from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances, must be forwarded to us and not to unauthorised third parties in India.

We take no responsibility whatsoever in respect of subscriptions not registered with us.

MANAGER

JBF INDUSTRIES

Major Restructuring

JBF INDUSTRIES engaged in the texturing business has done well in 1993-94 with net sales going up by 15 per cent, operating profit by 32 per cent and net profit by 61 per cent. The margins would have even higher but for the decrease in non-operating surplus by 433 per cent and other income by a 15 per cent. The company has declared a 21 per cent dividend for the year. Exports were up by 24 per cent while imports rose by 238 per cent. Debt-equity ratio came down sharply from 116 per cent in 1991-92 to 24 per cent in 1992-93 and 14 per cent in 1993-94. Short-term borrowings to inventories ratio fluctuated between 101 per cent in 1991-92, 84 per cent in 1992-93 and 116 per cent in 1993-94. While sales to total assets ratio rose from 56 per cent in 1991-92 to 100 per cent in 1993-94, sales to gross fixed assets ratio fluctuated between 194 per cent in 1991-92, 223 per cent in 1992-93 and 209 per cent in 1993-94. Remuneration to employees declined marginally in the three years.

The company underwent major restructuring in 1993-94. It had five divisions in 1992-93, viz, yarn, trichloroethylene (TCH), dyes and dye intermediates, pharmaceuticals and exports. It is now expanding and concentrating on its core business, textiles and bulk drugs. The TCH and dyes and dye intermediate divisions were sold off and the funds were used to pay off high-cost term loans. The company is expanding the yarn division by increasing texturing and twisting capacities from 9,000 tpa to 18,000 tpa to cater to the demand of the small and medium size weavers located in and around Surat and Bhivandi. As a backward integration programme, an 18,000 tpa POY project is being set up. The yarn division of the company has fared well with production of textured and crimped yarn increasing by 1938.892 mt. The pharmaceutical division too registered an increase in production of bulk drugs by 43.5 mt; production of drug intermediates increased by 92.51 mt. The company is expanding and doubling its ampicillin and amoxycillin capacities. The company has entered into a joint venture with Pharmachemie of Sri Lanka for the manufacture of bulk drugs and formulations. JBF will provide technical know-how from time to time for manufacturing the entire range of bulk drugs. The plant and machinery required for the project is to be exported by JBF India. The company also has a joint venture with Borisovskij Zavod Medicinskikh Preparatov of Russia for supply and erection of a vial filling plant for dry injection powder on a turnkey basis. The project is in an advanced stage of implementation and is expected to be commissioned soon. Under the arrangement the Russian

counterpart is to buy bulk drugs from JBF for the next five years.

KEC INTERNATIONAL

Record Production

An RPG Group company, KEC International is engaged in power transmission and turn-key projects, petrochemicals, cotton yarn and merchandise export. The company has done well in 1993-94 with net sales increasing by 51 per cent, operating profit by 54 per cent and net sales by a whopping 113 per cent. The increase in other income and decrease in depreciation and interest charges were balanced by a fall in non-operating surplus. Moreover, the company had to pay tax of Rs 5.8 crore. There has been a noticeable increase in selling commission by 254 per cent. A 35 per cent dividend was declared for the year. Exports increased by 155 per cent while imports were up by only 36 per cent. Debt-equity ratio, after a decline in 1992-93 to 60 per cent from 84 per cent in 1991-92, has now risen to 71 per cent in 1993-94. Sales to total assets ratio rose from 46 per cent in 1991-92 to 86 per cent in 1993-94 and sales to gross fixed assets ratio has gone up by 196 percentage points in the past three years.

The company, one of the leading players in the international market in the field of power transmission line, has achieved an all-time record in the production and despatch of transmission line towers. Construction activity both in India and abroad contributed to the high turnover of Rs 52 crore. The Cetex division contributed Rs 19.71 crore to the turnover. The market for MEK is buoyant and the unit is said to be working at full capacity. KEC International is planning to set up a new plant at Nagpur to meet the massive export orders in hand worth more than Rs 500 crore. For achieving the projected turnover of Rs 500 crore by 1997-98 from the present Rs 250 crore, the thrust is being laid on technology improvisation, increasing plant size, automation, modernisation and waste control, besides increasing both domestic and international market share.

For the six-month period ended September 30, 1994 net profit was up by 82 per cent. Sales in this period were up by 41 per cent. The company recently recommended bonus shares in the ratio of 2:1.

As a part of its energy conservation programme an automatic power factor correcting unit has been installed and capacitors to maintain power factor of 0.94 and above have been provided for. To reduce the wastage of radiant heat energy, the galvanising bath is covered with thick insulating sheets during recess times.

The company invested Rs 32 lakh for R and D activities in 1993-94. The tower division experimented with ways of reducing zinc and acid consumption. The company has also invested in computerisation of

planning data, in addition to extending the computer network to all locations. As a result, its Jaipur factory now has one of the lowest zinc consumptions in the Indian industry.

KINETIC ENGINEERING

New Models

Kinetic Engineering, the Pune based two-wheeler manufacturer, posted an increase in net sales by 6 per cent and in net profit by 22 per cent in 1993-94. Operating profit was marginally down by 1 per cent. The 15 per cent decrease in taxation, 18 per cent decline in interest charges and increase in non-operating surplus of Rs 10 lakh all helped in holding the margins at the present level. Exports were up by 75 per cent while imports increased by 241 per cent. A 30 per cent dividend was announced by the company. Debt equity ratio steadily declined from 55 per cent in 1991-92 to 27 per cent in 1992-93 and 18 per cent in 1993-94. Short-term bank borrowings to inventories ratio has fluctuated over the past three years between 26 per cent in 1991-92, 53 per cent in 1992-93 and 39 per cent in 1993-94. Sales to total assets and sales to gross fixed assets ratios have declined over the past three years. Remuneration to employees has been steady at 36 to 39 per cent.

KEL experienced a fall in the sales of its Luna mopeds by 86,801 vehicles in a span of five years. In 1992-93 it lost out its top slot to TVS Suzuki which sold over 1.16 lakh vehicles compared to 1.10 lakh Kinetic vehicles that year. Also, the group tie-up with Honda Motor Company of Japan, Kinetic Honda Motors (KHML), saw its Kinetic Honda KH 100 brand scooters sales fall from 82,526 vehicles in 1991 to 66,379 in 1993. Company sources attribute the decline in sales to the general recession in the automobile industry. With the industry now coming out of recession, the company expects sales to increase. Honda Motors recently increased its stake in KHML to 51 per cent. KHML is now being managed by S Nakai and, with larger Japanese involvement, greater inflow of engineering technology from Honda Motors is expected.

The company plans to expand its capacity and consequently Rs 60-70 crore is being invested. KEL envisages raising production capacity from 15,000 vehicles per month to 25,000 vehicles per month. Work has already started on the new 1.2 lakh vehicles per annum capacity plant to be set up in Bhima, which will handle production of new models. The company plans to modify its existing Luna models and two new models have already been designed. A 73cc two-stroke scooter, branded Kinetic Pride, was launched in November 1994. Another 75cc mobile, Kinetic Lava, is to be manufactured, targeting the college students segment. Commercial production is to

begin in June after initial trials in March. The vehicle is to be priced at Rs 20,000 which is half the price of other motorcycles in the market. The company also plans to manufacture an indigenous 100cc motorcycle for the rural market and an intra-city car which is to cost around Rs 60,000.

The company invested Rs 56 lakh on R and D activities in 1993-94. One of the major results of its R and D was the Kinetic Merlin which has a home computer, hi-fi stereo and a TV, and can also carry out the functions of a modem.

KOTHARI INDUSTRIAL CORPORATION

Expansion and Modernisation

The Madras-based multiproduct Kothari Industrial Corporation (KICL) has done well with the net sales posting an increase of 20 per cent, operating profit of 21 per cent and net sales of 188 per cent. The increase in other income by 95 per cent, non-operating surplus by 278 per cent and decline in depreciation by 55 per cent balanced the increase in taxation by 125 per cent and interest charges by 3 per cent. Exports rose by 268 per cent and imports were up by 101 per cent. A 22 per cent dividend was declared for the year. Debt-equity ratio of the company fluctuated at a 11 per cent in 1991-92, 29 per cent in 1992-93 and 18 per cent in 1993-94. Short-term bank borrowings to inventories ratio too fluctuated at 50 per cent in 1991-92, 29 per cent in 1992-93 and 30 per cent in 1993-94. The company's return on investment has improved marginally in the past three years. Remuneration to employees has declined in the past two years. Inventories experienced sharp fluctuations, they fell by 1 per cent in 1992-93 compared to a rise of 145 per cent in 1991-92 and rose by 19 per cent in 1993-94.

Despite the shortage of cotton and the unprecedented price rise in cotton prices in the latter part of the year, the division performed well. As a continuation of the modernisation programme certain ring frames were replaced with the latest long ring frames. With a view to exporting high international quality yarn three auto cones and three auto levellers were imported and were commissioned in July/August 1995. The plantation division saw 1,133 tonnes of coffee being harvested in 1993-94. Free sale quota for coffee has been increased to 50 per cent against 30 per cent in the previous year and through direct marketing of this quantity the company was able to realise more. Moreover, the minimum release price was revised upwards by the Coffee Board. With a view of raising profitability, the company has been growing pepper, cardamom, mango, orange and sapotta. During the year 30.44 lakh kgs of tea was produced as against 26.79 kgs in the previous year. The decline in tea prices has been affecting the division's profitability. During the year the company directly exported 1,14,400 kgs of made tea.

The fertiliser division, besides marketing its manufactured products, also marketed imported muriate of potash. Trading in pesticides has also commenced. The phosphate factory at Ennore was given the environment protection award by the Fertiliser Association of India. The granite division's turnover was Rs 217.39 lakh. The division has been exporting processed products like monuments and random slabs and also rough blocks. The expansion of the monument plant was completed in March 1994. The granite tile plant with 25,000 sq mts of tiles per annum capacity commenced commercial production in June 1994. To minimise the electricity cost the company has erected and commissioned a wind mill near Tirunelveli. The company is also in the process of implementing a project for the manufacture of beer in Andhra Pradesh.

AHMEDABAD ELECTRICITY

Higher Power Generation

Ahmedabad Electricity Company (AECL), has done well in 1993-94 with net sales going up by 21 per cent, operating profit by 8 per cent and net profit by 52 per cent. The company's bottomline would have been even better but for the decreased other income by 3 per cent, non-operating surplus by 79 per cent and increased depreciation by 5 per cent. The company declared a dividend of 18 per cent for the year. Debt-equity ratio fluctuated at 194 per cent in 1991-92, 204 per cent in 1992-93 and 140 per cent in 1993-94. Remuneration to employees has marginally declined over the past three years.

The overall generation of 2869 mu was an

improvement over 2722 mu generated in 1992-93 while sales increased by 183 mu in the year. The closure of the textile mills adversely affected the HT consumers to LT consumers ratio which imposed transmission and distribution losses on the company. But, an increase in sales to both HT and LT consumers was registered in 1993-94. The gas-based power plant at Vatwa continued to suffer due to inadequate gas supply. To arrest the worsening situation the company is planning to convert the system from a single fuel fired to a multiple fired system, for which Rs 10 crore is being invested. The power plant at Sabarmati was plagued with problems due to failure in generator transformer for the fourth year. The stagnant situation in the HT textile units and increase in outstandings from central and state government owned textile mills further aggravated the situation. As per the company's projections, by the end of the century there would be a gap between demand for power in Ahmedabad and Gandhinagar and the company's generating capacity of 300 MW. To overcome this shortfall, the company plans to add another 250/300 MW of generating capacity. According to the company, the fly ash division has done exceedingly well and the company is confident that it would register sales of Rs 100 lakh in the current year.

The company invested Rs 2 lakh on its R and D activities in 1993-94. It pioneered the usage of STA-clean coating on insulators and equipment of 66 KV switchyard and EHV lines, non-conventional type 011 KV hybrid straight through joints and 11 KV XLPE insulated unscreened conductor. All the technology imported in the past 10 years is claimed to have been absorbed.

CHANGING STATUS AND ROLE OF WOMEN IN INDIAN SOCIETY

Editors

C Chakrapani
S Vijaya Kumar

This edited volume provides a valuable discussion on the status and role of women in development of the society. With the changing times, the traditional role of women has changed from child bearing and rearing to bread-earner. In fact the book brings under the cover the role of women in the changing society and their changing roles under the broad categories of Health, Education, Employment, Politics, Popular Movements and Developments.

Who's Afraid of Liberalisation?

Arun Ghosh

Liberalisation in the hands of the government of India is today the sum of (a) 'globalisation' and (b) 'privatisation'. Both are ideological stances unconnected with genuine 'liberalisation' of the economy or polity.

THE economic reform policy, initiated in July 1991 and pushed through with conflicting policy pronouncements but unidirectional policy actions thus far, is variously described as economic liberalisation, globalisation of the economy and economic reform policy. Reform extends to diverse sectors of the economy, including industrial reform – extending to the privatisation of public enterprises – trade liberalisation, financial sector reform and fiscal stabilisation. The popular view, created by the media, is that what we are witnessing is liberalisation. To the common man, the idea is associated with the end of 'licence raj' or of 'permit raj' and, to that extent, the idea is popular. To the extent the ongoing reforms are directed to ending the 'discretionary' licensing system, no one – at any rate not many – have objected. However, the view that the ongoing economic reform policy is essentially directed to ending 'licence raj' (which has been popularised by the official publicity machinery) is totally erroneous. Hence, there is good reason for attempting a dissection of the reform policy, even though this has been attempted earlier. Anyhow, it appears to be worthwhile attempting an examination of whether and to what extent the present reforms are consistent with 'liberalisation', for today any policy action initiated by the government is promptly defined as part of the policy of economic liberalisation.

Such a dissection is necessary because *disinformation* is not confined to the media; it affects many people who may be expected to know better. In a recent reunion of some friends meeting after some 20 years, one (who has been living abroad for some two decades) questioned me as to how I – one of the original initiators of liberalisation of the Indian economy, *pace* the introduction of a cement pricing policy designed to gradually remove the price control over cement, a similar policy for steel, and of the *recommendation* (not accepted) for gradual elimination of the myriad controls over sugarcane and sugar production, distribution and pricing, the author of the Dagli Committee report on Controls and Subsidies (1979), consigned

by the government to the dust heap of history – could become a relentless critic of the economic reform policy. My simple answer was: 'Who's afraid of liberalisation?'

Let us re-examine the issue. What is liberalisation? And how do we justify what is happening in the name and guise of liberalisation? Let us attempt to answer the question in a novel way. Instead of a dull essay on the subject – since many people have written more interestingly on this topic – let us pursue the line popularised by many (recent-in-memory) contests. Let us use of a panel of three judges (who would, for the present, remain unnamed) to choose the most anti-liberal among policy-makers in India today. And, in line with the practice in such contests, we would start with the third runner-up, go on to the second runner-up, the first runner-up and, finally, end up with the champion. This procedure keeps up suspense, it heightens interest in what would otherwise be a drab essay.

But let us first define the parameters. What is 'liberalisation'? As per the Shorter Oxford English Dictionary, to 'liberalise' is "to free from narrowness; to enlarge the intellectual range of". Edmund Burke used the term in two contexts: speaking of a certain law, he said "It is not apt ... to open and to liberalise the mind", and in 1848 he said "Russia must liberalise or be convulsed". (How prescient Burke was!) Anyhow, note the emphasis: "to open and to liberalise the mind". So we would identify liberalisation with steps to liberate both the polity and the economy of the country. The two go together. And, there is a distinction – a very clear distinction – between liberalisation and many elements of the ongoing economic reform policy. We must ask: how can we liberate the polity of India (from the diverse narrowness increasingly in evidence)? How can we liberate the minds and release the energies of the vast multitudes of the people of this country?

So, let us have a contest to see who among the top policy-makers is afraid of liberalisation. Who is it we can honour as the champion of liberal thought and ideology?

For the third runner-up position, our panel of experts has come up with several

names, who run very close to each other. In the final run-up, three contestants ran each other quite close; but eventually, information minister K P Singh Deo was awarded the honour. (Let us keep the other two unnamed.)

To many of us, the choice would be a surprise. Why drag in the information minister as one afraid of liberalisation? What has he said or done? Well, K P Singh Deo is in charge of the official media, namely, the Doordarshan and the All-India Radio, and thereby hangs a tale. Those who prefer to watch the Doordarshan (in preference to CNN or Star TV) are now forced to readjust, for the numerous existing channels of the Doordarshan have started enthusiastically to beam the MTV for hours on end during the evening hours on the metro channel; and all types of sleaze, violence and sex (now the most important features of Indian movies) or ribald slapdash are on regular display on other channels. And those who acquired a radio set with the introduction of the FM channel (in order to listen to classical Indian music) have to now hastily shut down their radio set because the FM channel beams only 'philmy gaane'. If you want to hear good classical music, please order your own private record player, LPs, or cassettes and tape-recorders; and, for the more modern, compact disc systems.

Why is the information minister so desperately concerned about the 'cultural invasion' from the skies that he needs must Indianise the invaders' culture? Do the people of this country have any say in regard to the type of programmes broadcast? Would the information minister hand over a channel to each state government? Or introduce different channels (of music) for different tastes? That would be to liberalise, to decentralise, to open up the mind.

But obviously concepts vary. The *sharing* of the authority to broadcast (with the states, or the people) is farthest from the present government's agenda. The satellites have now made it impossible to keep out the likes of Star TV (although France has said 'no' to cultural invasion from the US; and nearer home China has virtually banned satellite TV – by banning private dish antennae – and made a deal in regard to programmes in Mandarin). So Doordarshan has to compete; it has to make a deal with the Hong Kong-based MTV. What is next on the agenda? We do not know, because the third regular channel – announced with fanfare as commencing from October 2, Mahatma Gandhi's 125th birth centenary – is still to appear, for reasons not made public.

In any case, transparency of policies has never been a part of the Indian government's

approach; and as the information minister in the union government, to K P Singh Deo must go the honour of creating (successfully or otherwise) a smokescreen in regard to all policies and actions of the union government.

K P Singh Deo has reason to be afraid of liberalisation. He is probably incompetent, unimaginative; in any case, unable to improve even the technical competence of his ministry. Consider the following example. On November 27, Bombay-born Zubin Mehta conducted a 125-member Israeli Philharmonic Orchestra at the Indira Gandhi National Stadium – specifically decked up for the performance – to commemorate Mahatma Gandhi's 125th birthday. The programme, designated as a 'Concert for Peace', was attended, *inter alia*, by many dignitaries. Doordarshan announced that it would broadcast the concert 'live'.

One should have known better than to trust Doordarshan. The recording was screechy, third rate, the light arrangements, the focusing deplorable. One must, of course, admit that TV is not the best medium for broadcasting a concert; it can never properly reflect the sound effects of a large orchestra, with different instruments arranged across a large stage. But the recording can still be good, though monophonic (rather than stereophonic). The recording was screechy at best; and regrettably the AIR, which is better attuned to broadcasting musical pieces live, was not asked to broadcast the concert. But worse was to come. At 7.25 pm sharp, barely 45 minutes after the concert had started – right in the middle of Tchaikovsky's violin Concerto – Doordarshan switched over to the studio for routine announcements, to be followed by the scheduled news at 7.30 p m. And while this also happens regularly when the Doordarshan relays sports events (like cricket), the special programme becomes available on Channel 2 (though that is not quite fair to viewers outside the metropolitan areas). But not the 'Concert for Peace'. Channel 2 continued to beam MTV music (which was obviously more important for our Doordarshan programmers).

And the same procedure got repeated at 8.30 p m for the (now half-hour) Hindi news. As if that were not enough, both before and after the news for a brief period the concert could be heard, but Doordarshan had to beam on the TV screen an advertisement for some automobile parts company. Talk of technical perfection. And what an ideal combination: Beethoven's Seventh Symphony blazing away with a carwheel spinning around. By the time the advertisements were over, so was the 'Concert for Peace'.

No wonder K P Singh Deo is genuinely afraid of liberalisation. He has good reason to be so.

The second runner-up in the present contest, as voted by our judges, is Kalpnath Rai, with his clear, categorical, unequivocal announcement regarding the controls essential for the sugar industry. Liberalisation is good for everyone else, but not in my domain, thank you. Did not someone say, where there is sugar there will always be flies? Well, you need a zealous guardian for an industry that attracts flies; who can question that? Kalpnath Rai's claim to the second runner-up position is so clear that one does not need the same elaborate explanation as one required for K P Singh Deo. He is an obvious winner, except that in the present instance, he is clearly bested by two other colleagues/peers.

The first runner-up is one who is supposed to have missed out being champion, by a whisker. Who could it be? The judges have had no difficulty in choosing N K P Salve for this honour. Does one need to go into details? For N K P Salve, 'globalisation' offers a golden opportunity for innovating new methods of fostering enormous 'rent seeking' – that of government guarantees of tax-free profits of 16 per cent on equity in the power sector, with an additional return of 0.7 per cent for each percentage point that the plant load factor of a power plant exceeds 68.5 per cent (with guaranteed offtake up to 90 per cent, forcing all existing power plants to back down heavily – with significant 'padding' of investment costs (estimated by no less an authority than Kirit Parikh, director of the Indira Gandhi Institute for Development Research to be 20 per cent). And to add insult to injury, Salve's minions have dubbed these payments as reward for efficiency.

Since 'liberalisation' is supposed to be liberation from 'permit raj' and since all transactions in the domain of Salve's authority have been based on private negotiations – the details of which have not been made known even to parliament to this day – the goose that liberalisation' in the true sense of the term were really to be introduced. N K P Salve should be really afraid of liberalisation and he must be smacking his lips that patently illiberal policies can be passed off to a gullible country (and a quiescent parliament) as part of the policy of liberalisation.

And now we have to wait (with bated breath) for the name of the champion to be announced. No, your guess is wrong. Manmohan Singh languishes below K P Singh Deo, even though his brand of liberalisation adds up to little more than privatisation. We would come to the (many) graces of liberalisation later. We must get on with the name of the champion. Yes, you have got it right at second guess. Hail

the champion in the 'who is afraid of liberalisation' contest in the haloed person of P V Narasimha Rao. As a matter of fact, Salve does not lose by a whisker, he is miles behind.

Do the judges need to explain their selection? Well, you have to peep into the private notes they made for the contest. Liberalisation involves democratisation of the polity; and what we witness around the country is increasing centralisation in every sphere. Liberalism involves transparency of the administration; and under a parliamentary system of the Whitehall-Westminster variety the buck stops at the prime minister. We have an administration today which is anything but transparent; and one has only to look up the record from the Ayodhya dispute to the senseless power-play on Uttarakhand marchers in UP and tribal and scheduled caste marchers in Nagpur. Finally, liberalisation should release the energies of the people for creative productive activity. What the sum total of policies adopted over the past 29 months adds up to is: duplicity in politics, duplicity in economics, total lack of transparency, increasing centralisation and extreme illiberalism in that some 80 to 90 per cent of the Indian population has been getting poorer by the day; the future of the country has been mortgaged and vast private fortunes have been made by a few in the name of liberalisation.

The economy, they say, is growing rapidly. And yet Kirit Parikh, a self-proclaimed supporter of the reform policy, tells us that foodgrains consumption (per capita) declined from 510 grammes per day in 1991 to 465 grammes per day in 1993; and this when foodgrains stocks with the FCI have reached a burdensome (and wasteful) total of 31 million tonnes (with 6 million tonnes added to stocks over the year), some part of the stocks doubtless becoming unfit for human consumption. And yet the stock market is booming and foreign exchange reserves are growing (with more and more predatory capital coming in to grab the equity of prize public enterprises being disinvested by government). To equate privatisation with liberalisation one has to rewrite the Oxford English Dictionary.

P V Narasimha Rao is the clear winner of the contest.

What are the elements of policy that are taking the country down the path of illiberal politics, to the concentration of economic power in the economic domain, to a sell-out of the economic sovereignty of the nation? That would take another essay; that would also involve a repetition of what has been stated earlier in this column on diverse occasions. But perhaps even at the cost of repeating oneself some of the elements of the ongoing policies need to be spelled out.

While we talk of devolution and of panchayat raj, the state governments are being stripped of all control over finances. Even though, under the Constitution, the responsibility for social and economic development vests with them. Whether it is fiscal policy or banking policy or policy for the capital market or policy relating to agrarian investments, or investments in social and economic infrastructure, relations between the centre and the states have been so manoeuvred as to have the latter forced into becoming abject supplicants of the centre. Add the control over the 'security' forces and the increasing outlay on security (at the cost of development), and you have the complete scenario. New Delhi today is as powerful in India as the Kremlin was during the days of Stalin in the USSR

Liberalisation in the context of over-centralisation of the polity can only be a sham. Also, liberalisation, even in the strict economic sense of the term, must be a sham when it leaves out in the cold some 80 per cent of the population, with the spectre of lack of employment, of income, of a wretched life in insanitary conditions, while large profits are being made by a few

Liberalisation is today the sum of two major policies: (a) 'globalisation' and (b) 'privatisation'. That both are ideological stances unconnected with 'liberalisation' would require another essay, but the examples of policies cited earlier should leave one in no doubt as to the real thrust of liberalisation. And, in the context of 'privatisation', perhaps Manmohan Singh should have got a prize; but the judges accord that prize to P V Narasimha Rao, because it is he who has been talking of

one thing when addressing the PSUs and doing the exact opposite when it comes to policy actions.

And is it not he who has repeatedly assured the foreigners – 'yes, only the foreigners – that our policies are irreversible? Well, the consequences of many of the policies are indeed irreversible, with some \$ 20 billion of predatory external capital poised to take over the oil and power sectors and, specifically, institutions like the ONGC, IOC, BHEL, the Power Grid Corporation and, through this mechanism, the NTPC and SEBs – in essence, control over the crucial energy sector in India.

It is important to ask ourselves, who is afraid of liberalisation? Who stands to lose if the policies of reckless 'rent seeking' (via the present policies) were to be reversed?

STUDIES IN HUMANITIES AND SOCIAL SCIENCES

(Journal of the Inter-University Centre)

Published twice a year at the Indian Institute of Advanced Study,
Rashtrapati Nivas, Shimla-171005

First Special Issue: Images of Communities in Modern Indian Literature. Guest Editor: Jaidev

Devoted to literary works that foreground the community as their main concern, the issue contains fourteen essays including two by novelists who discuss how and why they write the community in their fictions. Inter-community relations, tensions and transactions, and the difficult interface of the community and the nation are some of the recurrent themes which the contributors discuss in the context of various Indian literatures.

Myth of Inflation Control

Essential Commodities Worst Affected

EPW Research Foundation

While the rise in the general index of wholesale prices gives the lie to the government's claims of having brought inflation under control, what is far worse has been the phenomenal rise in the prices of essential articles of mass consumption including foodgrains, pulses and vegetables. Incredibly, the government seems completely unconcerned about the impact of this on the living standards of the vast majority of the people.

THE most disquieting aspect of the current economic scene is the persistence of inflation. Apart from the rise in the general wholesale price index, what stand out are the especially sharp increases in the prices of basic consumption goods and consequently in the cost of living indices, particularly those relevant to vulnerable sections like agricultural labourers and industrial workers.

The latest provisional general index of wholesale prices (base: 1981-82 = 100) for December 17, 1994 shows a rise of 10 per cent over the final index for the corresponding week of December 1993. Based on past experience, it is to be expected that when the final index number is known, the annual price increase would work out to anywhere around 10.5 to 11 per cent against about 8.8 per cent in the preceding 12-month period. The weekly average of the general index for the past 12-month period gives an accelerated price rise of 10.3 per cent against 7.7 per cent in the previous 12-month period. Likewise, the weekly average of the WPI for the current fiscal year so far shows an increase of 10.5 per cent against 7.8 per cent in the corresponding period of the previous year, though on a point-to-point basis the rise this year so far at 7.2 per cent has been somewhat lower than that last year (8 per cent). On a point-to-point basis, over the 12-month period, every major of commodity group has shown an accelerated rate of increase. In the fiscal year so far, the sharpest increase has occurred in 'food articles' (12.9 per cent) and in the specially computed 'food index' (10.9 per cent) consisting of 'food articles' from among primary articles and 'food products' from among manufactured products.

POST-REFORM PERIOD

Table 1 presents detailed data on the increases in the WPI of major groups and sub-groups of commodities cumulatively since the beginning of the fiscal year 1991-92, that is, on the eve of the initiation of the stabilisation and structural adjustment programmes. Since then there has occurred an increase of 44.4 per cent in three and three

quarters of a year or an annual (compound) inflation rate of about 10.3 per cent compared with 7 per cent in the first half of the 1980s and 7.4 per cent in second half. The extent of price increase has differed from commodity to commodity in individual years. In the current fiscal year so far, for instance, large increases have occurred in many of the sub-groups under primary articles – foodgrains and, among them, pulses, vegetables, eggs, fish and meat, condiments and spices, and other food articles.

However, taking the past four-year period as a whole, the price increases have been widespread and sizeable. Among the major sub-groups of primary articles, the increases during the period end-March 1991 to December 17, 1994 ranged from 42 per cent to 93 per cent. This has happened despite the fact that the country has enjoyed good agricultural seasons unprecedentedly for seven years in succession. During the period cereal prices have risen by 52.7 per cent and pulses prices by 65.9 per cent, simultaneously vegetable prices have gone up by 55.2 per cent, eggs, meat and fish by 79.4 per cent,

condiments and spices by 52.5 per cent, and fibres by 93.2 per cent. The only commodity sub-groups which have shown moderate price increases are fruits (23.6 per cent) and oilseeds (24.8 per cent).

Within the main group 'fuel, power, light and lubricants', electricity (65.9 per cent) and coal mining (58.1 per cent) have experienced high tariff/price increases. Similarly, within the 'manufactured products' main group, price increases have been large in some items of food products and other agriculture-based products: dairy products by 51.7 per cent and sugar, khandsari and gur by 68.1 per cent. Amongst other manufactured products, sizeable increases have occurred in the prices of soft drinks (55.7 per cent), cotton textiles (54.9 per cent), wood and wood products (169.6 per cent), chemical and chemical products (54.2 per cent), fertilisers (100.6 per cent) and drugs and medicines (45.3 per cent).

Interestingly, even the prices of basic and capital goods, which had suffered in the initial period of the new economic policy due to severe recessionary conditions and which are generally said to follow cost-plus pricing, have begun to look up rather markedly. This is evident from the fact that in many industries the bulk of the price rise of the past four years has occurred in the current fiscal year. For instance, after their decontrol in 1989, cement prices rose by 14.1 per cent in 1990-91 and another 17.4 per cent in 1991-92 but thereafter the relevant price index fell from 217.1 at the end of March 1992 to 203.2 at the end of December 1993. Since then, with improvement in construction activity, the cement price index has again shot up by 15.2 per cent until December 1994 (Table 1). In the case of machinery and metals and metal products

TABLE 4: ANNUAL INCREASES IN WPI AND IN GDP DEFLATORS OF COMMODITY PRODUCING SECTORS

Fiscal Year	Annual Average of WPI		Deflators of GDP Originating in Commodity Producing Sectors*		
	1981-82 = 100	Per Cent Variation	1980-81 = 100	Per Cent Variation	Deflators Converted to Base 1981-82 = 100
1981-82	100.0	-	108.7	+ 8.7	100.0
1982-83	104.9	+ 4.9	116.5	+ 7.2	107.2

* Based on monthly seasonal indices # Provisional \$ Up to December 17, 1994

also, the price increases in the current fiscal year so far in some of the products have been sizeable: electrical machinery (10.4 per cent), non-ferrous metals (14 per cent) and ferro alloys (39.2 per cent).

Table 2 presents the extent of price increases in a defined basket of basic consumption items during the period March 1991 to end-October 1994 (based on the availability of commoditywise details). These items, which together carry about one-third weight in the WPI, have faced every year higher prices than the rise in the general price level. In the current financial year, while the general index showed a rise of 6.7 per cent up to the end of October 1994, the composite index for basic consumption items has registered a rise of 11.5 per cent. Among these items, high increases took place in pulses (17.2 per cent), vegetables (98.7 per cent), fish (18 per cent), tea (25.4 per cent), coffee (178.6 per cent), Khandasari (13.6 per cent), gur (19.1 per cent), groundnut oil (14 per cent), and drugs and medicines (14.3 per cent).

Taking the period since March 1991, the price increases in some of the common man's consumption items are truly mindboggling: rice (60.7 per cent), gram (10.8 per cent), vegetables (153.9 per cent), and among vegetables potatoes (84.9 per cent) and onions (70.3 per cent), fish (136.8 per cent), coffee (195 per cent), khandasari (73.6 per cent), and gur (102 per cent) (see also Graph A).

COMPARISON OF WPI WITH CPIs

The higher increases in the prices of common consumption items should get reflected in the cost of living indices of different wage-earning groups, though there are significant structural and other differences between the two sets of indices. While the WPI measures changes in producer prices or in prices at the wholesale level, the CPIs measure the final price at the retail or consumer level. Other significant structural differences relate to commodity composition (goods only in WPI, while CPI includes 'services' to households but excludes capital goods as well as intermediate goods), weighting diagrams, geographical coverage and base period.

Table 3 presents monthwise movements of inflation rates - annual and cumulative since March 1991 - in WPI (in all commodities and primary articles separately) and the three consumer price indices. Broadly, it could be said that the CPI for industrial workers moves parallel to the movements in the general index of wholesale prices, at best with a short lag of about three months in the former vis-a-vis the latter. Secondly, the CPI for agricultural labourers behaves similar to the behaviour of the WPI for primary articles roughly with a lag of about four to six months. Finally, the CPI for urban non-manual employees shows considerably less of association with the WPI.

GRAPH B: WPI FOR PRIMARY ARTICLES: ACTUAL AND SEASONALLY ADJUSTED INDICES FOR INDIVIDUAL YEARS: 1989-90 TO 1994-95

□ Actual + Seasonally adjusted

In India, as inflation is usually led by the prices of primary articles, the CPI for agricultural labourers generally experiences the highest rise during a period of high inflation, as has been the case during the past one year (Table 3).

WPI AND GDP DEFLATORS

It is now accepted that the implied increases in the WPI with as remote a base

as 1981-82 = 100 do not reflect the reality of the annual inflation rates, though it is difficult to discern the direction or extent of the discrepancy.

Apart from the remoteness of the base period, a multitude of problems arises in the construction of the index: inadequacy of coverage of items and regional representation, representativeness of price quotations for individual items, non-inclusion of traders'

margins as well as unofficial market quotations, non-reporting of items, unsystematic revisions and substitution of varieties. One clear indication of the under-reporting of the inflation rate by the WPI is brought out by a comparison of the annual rates of increase in the average WPI and those in the average deflators for the gross domestic product originating in the commodity producing sectors (Table 3). The

annual increases in GDP deflators so derived have always been higher than the annual increases in the average WPI. The GDP deflator (with base 1981-82 = 100) had reached 255.1 in 1992-93 (an increase of 155.1 per cent in 11 years) against 228.7 for the average of WPI (a rise of 128.7 per cent in the same period). There are no doubt significant differences in the composition of the two sets of data such as in the case of agriculture where, with the double-deflation method, state-level average prices worked out as the weighted average of district level prices prevailing during the peak marketing period are taken into account. These questions are outside the scope of this note, except to take cognisance of the fact that the GDP deflator for the commodity-producing sectors appears much more comprehensive regionally and by commodity composition than the WPI. If at all, even the GDP deflator may be underestimating the average inflation rate due to such factors as the inclusion of peak marketing prices for agricultural crops; this is particularly true for years in which the lean season prices rise at a faster pace than the peak marketing season prices. Even with the current systems of measurement, the CSO's GDP data give about 10 per cent higher terms of trade in favour of agriculture *vis-a-vis* manufactured prices in 1992-93 (each with base: 1981-82 = 100).

ABSENCE OF SEASONAL FALL

As indicated above, the current high-level of inflation seems, on the face of it, somewhat exceptional as it has occurred despite one of the best kharif outputs in recent years on top of the preceding six successive years of good agricultural production. This is particularly true of the behaviour of both the general index of wholesale prices and the WPI for primary articles. As indicated in Table 3, the price increases during the lean season of 1994-95 (March to July 1994) were phenomenally high, which was followed by some slowing down of the inflation rate only for the two months of August and September 1994. In order to take a closer look at the time series of WPI, we have sought to disaggregate the series into seasonal and de-seasonalised (trend) components. This has been done in respect of three categories of WPI, namely, (a) all commodities, (b) primary articles (other than minerals), and (c) fuel and manufactured products, on the basis of monthly data for the period of April 1987 to December 1994.

The results (which are not reproduced here) bring out that the seasonal amplitudes, while they continue to be present, seem to have become somewhat blurred in the recent period in respect of all the three components of WPI indicated above. Even so, to an extent in the all commodities index and somewhat more distinctly in the primary articles index, there are significant seasonal elements. In this respect, the lessons to be

derived from Graph B are illuminating. Each of the six blocks in this graph, representing separately six individual years 1989-90 to 1994-95 (up to December 1994), presents two curves - one actual WPI series of primary articles (other than minerals) and the other seasonally adjusted series. It may be observed therefrom that in the three comparable years, each in terms of a quantum jump in agricultural output, the two years, namely, 1989-90 and 1992-93, experienced a distinct

seasonal fall in the price index of primary articles in the post-kharif period. In the current year so far, there has occurred a fall but the fall has been significantly moderate.

The above phenomenon of higher than expected level of WPI for all commodities and primary articles is better represented in the difference between original index and expected index (applying the monthly seasonal indices) during the period October-December each year (Table 5). By this

+ excluding minerals

yardstick the expected index of WPI for all commodities for December 1994 should have been 267.80 against the actual of 276.60 thus suggesting an excessive increase of 3.3 per cent; in the WPI for primary articles (other than minerals) such excessive rise worked out to about 3 per cent.

POSSIBLE CAUSES

The macro-economic data obviously suggest distinct contra-indications in regard to inflation during the recent period. If agricultural output is considered as having a dominating influence on inflation in India, these contra-indications are true of the entire period since the beginning of 1991-92. These are further reinforced by a comparison of the recent developments in regard to inflation with those of the 1980s. The decade of the 1980s was generally marked by some moderation in the rate of inflation. The annual average of the inflation rate as measured by the WPI worked out to about 7 per cent during the decade 1980-81 to 1990-91 despite a high level of money supply growth (17 per cent per annum in M_2) and a series of macro imbalances such as the large internal and external debt incurred by the central government, sizeable budget deficit and, above all, a phenomenally high-level of monetised deficit. Agricultural growth, which is a major factor on the supply side, showed vast year-to-year fluctuations during the decade. Even so, it did show a decent growth of about 3.6 per cent per annum (compound).

The first four years of the 1990s so far have also experienced a similar growth in agriculture. The overall monetary growth has been around 17.6 per cent (if 17 per cent growth is assumed for 1994-95). A significant aspect of the monetary growth in the 1990s has been the curtailment of the centre's borrowing from the Reserve Bank of India, that is, the size of the monetised deficit. Despite these reasonably favourable supply-demand factors, the underlying inflationary phenomenon has persisted in the post-reform period. An answer to this phenomenon has to be found in certain specific factors that have operated during this period giving rise to significant sectoral price pressures, some of which are directly related to the stabilisation and structural adjustment programme.

First, the policy of reducing subsidies in some of the commodities has led to higher prices for them. Since March 1991, the WPI of fertilisers has shot up by 100.6 per cent; similarly, electricity tariffs have gone up by 65.9 per cent and coal prices by 58.1 per cent. Secondly, the devaluation of the rupee with simultaneous emphasis on export-promotion has put some pressure on the prices of import-based and export-oriented industries. Because of the operation of other forces such as the simultaneous reduction in customs and excise duties, it is difficult to pinpoint the effect of these factors on specific commodity prices.

Micro-level studies have, however, brought out that prices of imported drugs, which did not carry high customs duties in the past and hence have not enjoyed any substantial reductions, have sky-rocketed because of the devaluation of the rupee. Likewise, aggressive export promotion of many primary commodities has pushed up their prices in the domestic market.

A third, and probably the most important, factor responsible for the acceleration in the inflation rate since the beginning of the 1990s as compared with the 1980s is the high levels of procurement and minimum support prices granted to agricultural commodities. Between 1980-81 and 1990-91, the procurement price for the common variety of paddy was raised from Rs 105 per quintal to Rs 205 per quintal, i.e., an annual increase of a little less than 7 per cent or roughly equivalent to the general inflation rate, whereas in the next four years, the increase has been from Rs 205 to Rs 340 per quintal, i.e., at the annual rate of 13.5 per cent which is much higher than the average inflation rate of 10.7 per cent during the period. The contrast in the increases in the procurement prices of wheat for the two periods has been even more glaring: from Rs 130 to Rs 180 per quintal or at the rate of 3.3 per cent per annum in the 1980s and from Rs 180 to Rs 360 per quintal or at the rate of 18.9 per cent per annum in the 1990s up to the 1994-95 marketing season. This phenomenon is seen without exception in the entire gamut of price fixation for jowar, bajra, maize, ragi and major varieties of pulses. In consequence, and also as part of the policy of reducing

subsidies, the increases in issue prices of these commodities have been much larger.

A final factor which may have contributed to the accentuation of the inflationary situation is the impetus given to free-market forces in the new economic milieu. Earlier, there was a semblance of control on trade through the Essential Commodities Act and such other administrative restraints against speculation. They have all been given the go-by and hence the holding power of the rich farmers and the speculative proclivities amongst traders must be expected to play a major role in inflation in the coming months.

A broader aspect of the socio-political milieu which will contribute to the strengthening of the inflationary forces relates to the accentuation of inequalities in the distributions of incomes and assets as a result of the new economic policy. Experience shows that a higher rate of economic growth within such a distorted socio-economic structure *ipso facto* requires a higher level of inflation. The government has no doubt begun to take specific measures to contain inflation – for example, RBI's open market operations and monetary control and moderate increase of only 3 per cent in the procurement/minimum support prices for the rabi crops to be marketed in the 1995-96 marketing season. While these measures may have some short-term impact, it is unlikely that they will curb in an enduring manner the underlying inflationary forces, which derive their impetus from the structural features of the economy and which have become all the more powerful in the new socio-economic milieu.

Beware of Bureaucratic 'Doras'

Kancha Ilaiah

The staff associations of the central government employees have submitted a memorandum to the Fifth Pay Commission suggesting revised pay scales and other benefits for IAS, IPS and other government officers. The proposed salary structure indicates a conspiracy by the bureaucrats to squeeze the state's resources in order to indulge in western-style conspicuous consumption, even while the masses become increasingly impoverished.

THE Fifth Pay Commission is in the process of working out the modalities of pay increase for the employees of the central government of India. It goes without saying that once the pay scale system of central government employees is worked out, the pay scale of different public sector units, autonomous bodies such as universities, and the employees of state governments will be worked out based on the pay scales of central government employees. Of course, the constitution of the Fifth Pay Commission is one of the routine processes of the central government as it has to refix the pay scales every 10 years based on the price index, the rate of inflation, etc. As I am not an economist, I am not really competent to discuss the basis of pay fixation and such matters.

What I am concerned with here is a specific question which in many ways is going to condition our socio-economic life in the future. The Delhi University Teachers Association (DUTA) has circulated a newsletter (of October 1994) in which a shocking thing is revealed with regard to the trend of pay scales for which the central government employees are going to ask. DUTA asked various teachers associations of India to suggest the modalities of pay scales, promotion avenues and the structure of other benefits. For the information of the teachers associations, the DUTA newsletter furnished the details of pay scales, promotion avenues and other benefits that the Staff Associations of Central Government Employees (SACGE) suggested in their memorandum to the Fifth Pay Commission. DUTA asked the teacher community to study the pay scales suggested by SACGE and to suggest teachers' own pay scales, so that it can submit a similar memorandum to the pay committee appointed by the UGC recently. The 22 main items that SACGE suggested to the Fifth Pay Commission are given in the tables.

What is shocking is the very mood and thinking of central government employees in suggesting these scales, promotion avenues and other benefits. The suggested pay scale for a cabinet secretary is Rs 60,000 (fixed) per month as against the existing Rs 9,000, and Rs 55,000 (fixed) for a secretary as against Rs 8,000 (fixed) per month at present. For an additional secretary the suggested

pay scale starts at Rs 44,000 with an annual increment of Rs 1,000, ending at Rs 55,000, as against their present pay of Rs 7,000-7,600. The suggested junior scale for IAS officers is Rs 9,000 per month with an annual increment of Rs 250, culminating in Rs 13,500, as against the existing Rs 2,200-4,000 pay

scale. That means the gross salary of a just employed IAS officer would easily work out to Rs 16,000 and more per month. The gross salary of a cabinet secretary would be around Rs 1,20,000 per month.

The other items they asked for are much more shocking. They want their retirement age to be raised to 60 years as against 58 years. They asked for total exemption from income tax and for 100 per cent neutralisation of DA. Their medical facilities need to be changed from government hospitals to non-government hospitals with a guarantee of full medical insurance; their group insurance needs to be raised to Rs 5 lakh. They want free transport and also a vehicle advancement of Rs 2.5 lakh. Having got all this, they need to live in a comfortable house, and so have asked for a lowered interest rate House Building Advance (HBA) of just 7 lakh. Since all this is not enough, they need a reasonable education allowance of only Rs 500 per

TABLE 1. PAY SCALES PROPOSED BY SACGE

Existing	Proposed

Cabinet secretary 9000 (fixed)	Not suggested	60000 (fixed)

Notes: FAS = For All Services; IAS = Indian Administrative Services

TABLE 2. LENGTH OF SERVICE (IN YEARS) REQUIRED TO GET PROMOTION

Service	Junior Administrative Grade	Selection Grade	Joint Secretary	Additional Secretary	Secretary
IAS	8.5	14	16	25/26	31
IFS	9	14	18	29	31
IPS (police)	8.5	14	-	29/30	32/33
IA and AS	8/9	-	17/18	30	-
IPS (postal)	11/12	-	23/24	30	-
IRS	9	18	22/23	31	-

In case of Indian Administrative Services (IAS), the year of admissibility to various grades is as under:

Junior scale (Rs 2200-4000)	- Beginning
Senior scale (Rs 3000-4500)	- 4th year
Junior administrative cadre I grade (Rs 3700-5000)	- 9th year
Selection grade (Rs 4500-5700)	- 14th year
Senior administrative grade (Rs 5900-6700)	- 16th year

Rules of Promotion for IAS:

- Senior scale on completion of four years to be given automatically.
- Junior administrative grade on January 1 of the year in which the officer completes nine years to be given automatically.
- Selection grade when an officer enters the 14th year of service, to be given practically automatically.

month up to a maximum of two children. The mood seems to be that if the government allows this education allowance without limit, they would like to procreate more children so that they can get further Rs 500s per month. A forgotten suggestion seems to be that those who do not want to produce children also need to be given some allowance because that is going to help the state by reducing that bureaucratic family's growth to a negative rate. The Indian bureaucratic class does not seem to be producing children for children's sake but producing them for allowance's sake.

Apart from these substantial monthwise benefits, they asked for lowering the qualifying service for pension to 28 years, raising of pension to 75 per cent of emoluments for full qualifying service, no ceiling for gratuity, encashment of 12 months earned leave, LTC once in two years as against existing once in four years (that must be given even after retirement), so on and so forth. It is quite obvious that the senior IAS officers who can influence the Pay Commission are involved in suggesting such pay scales and other benefits.

There is a criminal conspiracy in asking for and probably getting, if not as it is, but near about scales. The conspiracy is to squeeze the state's resources and indulge in western-style conspicuous consumption in a country where more than half of the population does not get two square meals a day. It is widely accepted that our bureaucracy is a non-working negative bureaucracy which treats the state and its resources as its private property.

If their suggested scales are of absolute necessity for a 'comfortable' life, they must be starving in the present scales. But the reality is not that. Even a person from poor family without any property, within a short time after joining service as an IAS or IPS officer, can acquire urban properties. In a situation of collusion of bureaucrats and politicians their non-salary incomes have no limit. Yet they want these salaries; greed does not seem to have any limits.

We were all witness to the fact that after the revision of pay scales in the 1980s, almost one-third of the top bureaucrats and university teachers entered the 'Maruti car class'. In spite of increasing inflation, as the employees' DA rates were correspondingly increasing, the position of the salaried class is far better than that of middle peasants or small entrepreneurs. The IAS officers, in their memorandum, made it very clear that they want to belong to the 'Maruti class' and hence asked for Rs 2.5 lakh vehicle advance, of course, specifying the price of a Maruti 800.

Do not these 'responsible' officers, a great majority of them meritorious as they did not come under the reservation quota, know the economic condition of the country? Are they not the ones who are handling the economic affairs of the country? Are they not the ones

who are flying across the world to raise loans even to construct a village road? Do they not know that the World Bank and IMF are after us to squeeze us and capture all the markets? Are not the same officers telling us with the help of statistics they themselves collected, that half of the Indian population is living below the poverty line? Yet why are they asking for such salaries and benefits? Is it patriotic for high administrators of this country to draw more than Rs 1,00,000 salary per month?

The conspiracy of this mode of thinking is not an ordinary one. It is very much linked to the liberalisation process. On the one hand the same government is indulging in

disinvestment in sector after sector. Even the selling of shares in the railways is being mooted. All this is being done in the name of 'efficiency' of the public sector. 'Loss showing' in every public sector company has become the logic of the day, so that, that particular company should become privatised in no time.

In the face of all this, if government employees draw salaries at this level, the first thing that will happen is that 'democracy in India' (in whatever form that it exists) will collapse. How? In the face of the tremendous inflation that this salary structure itself is going to create will ruin the economy in all fronts. Since the government would not be

TABLE 3: OTHER BENEFITS

Benefit	IAS	IRS	Joint Consultative Committee
Retirement age	To be raised to 60	To be raised to 60	
Pension entitlement	-	-	5 years of service
Qualifying service for pension	To be lowered to 28 years		30 years
Rate of pension	To be raised to 75 per cent of emoluments for full qualifying service		75 per cent of emoluments for full qualifying service, proportionate increase for qualifying service in excess of 30 years
Minimum pension			Rs 24,00 pm
Gratuity	No ceiling	No ceiling	The ceiling of 16.5 years and Rs 1,00,000 to be removed
Encashment of earned leave	Up to 12 months	Up to 12 months	300 days
LTC	Once in 4 years	To be given once in 2 years	Once in 4 years
Voluntary retirement	after retirement also	after retirement also	to retired persons also
Encashment of half pay leave	Be permitted without any deduction	-	After 15 years of qualifying service
Housing	Raise HRA to realistic levels	Taking houses on lease	Equivalent of the half pay leave accumulated
CCA	In terms of percentage of basic pay	HRA to be realistic	-
Medical facilities	From non-governmental hospitals should also be permitted	Rs 500-Class-A city	-
Group insurance	Ceiling to be raised to Rs 5 lakh	Rs 400-Class-B city	-
Conveyance	Free transport	Rs 300-Class-C city	-
Bonus	Scope to be narrowed down	Medical insurance	-
Vehicle advance	Ceiling to be raised to Rs 2.5 lakh	Ceiling to be raised to Rs 5 lakh instead	-
HBA	Ceiling to be raised to 7 lakh; interest rate to be lowered	Rs 1.2 lakh	-
Computer advance	To be given separately	Provide transport facilities to all	-
Education allowance	Reasonable up to two children	No ceiling	-
Income tax	Income totally exempt from tax	To be raised to exfactory price of 800 cc Maruti	-
DA	100 per cent neutralisation	To be raised to Rs 10 lakh	-

able to pay such huge salaries, mass retrenchment would take place. Along with the top industrial class the top bureaucratic class will become thoroughly integrated into imperial markets. Already the gap between the urban and rural economies is enormous (if we exclude urban slums), and this gap is going to increase. 'Americanised' riches and comforts on the one hand, mass poverty and starvation deaths on the other, will become the order of the day. We know that the dalits, bahunjans and tribals will be the victims of this kind of inflation economy.

The same bureaucrats will, then, begin to say that democracy is an inefficient system, and dictatorship controlled by imperialist bosses will be projected as the only alternative.

Whether it is DUTA or other teachers' and employees' associations, they must understand the implications of this kind of salary structure. Instead of asking for such salaries we must, first, fight this very mood of aggrandisement. One only hopes that the teaching community behaves with greater responsibility, not toward one's self and one's own family, but towards the starving masses of this country.

ANDHRA PRADESH

Tribal Forums Unite for Self Rule

B Janardhan Rao
M Bharat Bhushan

In the face of threats to their lands, livelihood and cultural identity posed by state policies – including the proposed forest and land transfer bills and the Polavaram dam – and rising atrocities on tribals, adivasis in Andhra Pradesh are demanding the creation of a separate tribal district of Bhadrachalam and self rule in tribal areas.

SEVERAL forums of tribal people jointly organised a conference on 'Threats to Tribal Identity and Importance of Self Rule' on November 20, 1994 at Bhadrachalam, Khammam district, Andhra Pradesh. The conference, convened by Mokalla Papaiah, addressed issues related to land alienation and displacement of tribals; atrocities against tribal women, tribal employees and tribal sarpanchs; implications of proposed bills on forest and resettlement and rehabilitation; need for tribal self-rule; and the recommendations of the Bhuria Committee. The state level conference was attended by 300 delegates from Khammam, Warangal, Vizianagaram, Vishakhapatnam, Srikakulam, East Godavari, and West Godavari districts and Hyderabad, representing organisations of tribal employees and students, scholars of tribal studies, development NGOs and co-ordination forums at national, state and district levels. Participant organisations at the conference included the Akhila Bharata Adivasi Vikas Parishad, A P Adivasi (Girijana) Samakhya, Koya Abyudaya Sangham, Adivasi Sanghibava Committee (Warangal), Krushi (Warangal), Yard, Secure, Casas, and CPS. After the delegates' conference, a procession of 3,000 people went around Bhadrachalam raising slogans related to the Land Transfer Regulation Act, Forest Bill, proposed Polavaram dam, tribal self rule, Bhadrachalam as a tribal district, common property resources, etc. A public meeting held in the evening was attended by about 5,000 people.

B Janardhan Rao, addressing the public meeting, outlined how development policies

pursued by the post-independence governments have further intensified the process of marginalisation of the rural poor and tribal communities by alienating them from their common property resources. He said that the current economic policy is destructive in general and would lead to the erosion of tribal identity as well as their extinction as distinct peoples. The moves towards lifting restrictions on land transfer in agency areas, he said, would turn the tribals into destitutes and slaves in their own lands. In the long run the process would also uproot the small and middle peasants among non-tribals in the agency areas, as these lands increasingly become the playgrounds of industrial and foreign capital interests. He said that there is an urgent need to extend the Sixth Schedule provisions to all tribal agencies and initiate the process of tribal autonomy to safeguard the rights of tribal communities as guaranteed by the Constitution. Speaking about the Forest Bill, he said that it should be radically reframed to protect forest wealth from becoming the private resource of capital interests. Unless it is amended the traditional rights of adivasis would be totally eliminated, and this would lead to the privatisation of public resources. All development projects hitherto introduced in the agency areas have only developed the tribal region, but not the tribal people. A distinction must be made between 'development' of tribal regions and tribal emancipation, failing which all those programmes aimed at tribal development would further intensify the hold of the migrants and weaken that of the natives, and would only create the illusion of tribal development while the ground reality

continues to be one of growing conflict and contradictions in the agency areas.

The general secretary of the Adivasi Vikas Parishad (AP), G D V Kumar, explained the growing threat of development policy in terms of the physical numbers of tribal communities. He said that the increasing atrocities on tribal employees reflect the unaccommodative nature of modernisation process on one hand, and the threat to the survival of illiterate and powerless tribal men and women, on the other. He argued that the extension of the Sixth Schedule provisions to all agency areas was the only way to prevent the extinction of tribal communities and that around 8 per cent of the national budget must be allocated to tribal bodies to ensure their progress and freedom.

M Bharath Bhushan, environmental activist, said that the current economic policy spells doom to people in rural and tribal areas. Large tracts in the agency areas are to be converted into private estates in the 'national interest'. Several big projects of mining, irrigation and power are being hastily cleared and thrust on the agency areas without the consent or knowledge of the project-affected people. This is conspiratorial and anti-people as this development reduces people to dispensables, he said. "The proposed Polavaram dam across river Godavari would wipe out the Koya community as a whole, causing environmental catastrophe in the eastern Ghats and widening regional inequalities and imbalances", he said. "There would be a serious socio-environmental crisis and social unrest as the Polavaram project threatens to submerge 350 settlements in Andhra, Madhya Pradesh and Orissa and 2.6 lakh acres of land under cultivation, and displace 2,24,724 people among whom tribals are around 1.5 lakh." He said that the loss in terms of forests, wildlife sanctuaries, and archaeological sites would be irreparable. The loss in terms of forest wealth itself would be around 65,000 hectares due to direct submergence and vertical (uphill) migration by the tribals. The Polavaram project was being pursued to suit the interests of political parties in the developed coastal Andhra districts and industrial interests of Vishakhapatnam. He said that the project should be immediately withdrawn, lest it invite severe unrest in the eastern Ghats.

Murla Yerraiiah Reddy, former MLA, said that the moves to withdraw the Land Transfer Regulation Act would deny the right to survival of the tribal communities, and there would be mass uprising in the agency areas against such myopic and anti-poor moves. Only united struggles of tribal forums of various sections and at different levels would arrest the march of encroachment of foreign capital interests into tribal areas, he said. Bodies such as the Integrated Tribal Development Agency, Girijana Co-operative corporation, etc, have strived to meet their

organisational interests like any other trading enterprises rather than adequately addressing the genuine issues and needs of the tribals. They only perpetuate the hold of the middlemen. The political parties in the area failed to address the real issues of impoverishment and exploitation of tribals by organised forces of trade.

Ramesh, co-convenor, Adivasi Sangheebhava Committee, dwelling on the educational and employment concessions given to the tribal communities, said that they are nominal in essence, and even those provisions were being denied to them with a few migrant and developed communities gaining tribal status of late on the one hand, and the discrimination by dominant caste groups on the other. Referring to the repeated torching of a small village of Gothi Koyas (Poongutta village in Pega Panchayat of South Bhadrachalam Forest Division) by the forest department, and the campaign by vested interests portraying Gothi Koyas as criminals, he asked how Gothi Koyas, who cut tens of trees in the reserved forest are termed criminals while Bhadrachalam Paper Board illegally clears hundreds of acres of forest, remains most civilised. He said that calling tribals as criminals was a new device to isolate and demoralise the tribals in their own land. The conspicuous silence or covert support to such anti-tribal machinations and atrocities by the parliamentary left parties was highly deplorable, he said. He requested the left and democratic forces to acknowledge the problem of tribal identity in the true sense and to combat the forces aimed at eliminating cultures and threatening the survival of tribals as peoples, instead of paying lip-services to the issue of tribal oppression and exploitation.

Mokalla Papaiah, convenor of the conference, said that the tribals are facing several threats to their survival. During the past two years several tribal women, sarpanches, and employees have been subjected to assaults and murder. Tribal women in large numbers were subjected to sexual exploitation, concubinage, and desertion in roadside villages and mandal headquarters. Recently, a tribal woman was murdered and made to look like a suicide in a lodge in Bhadrachalam, while a sarpanch in Chintoor mandal headquarters was tortured for three days and killed by a group of contractors a few months ago. Similarly several tribal employees in ITDA and ICCS are being discriminated against, harassed and some even kidnapped. The government machinery in the agency areas is highly negligent of the growing threats to tribal survival. He said that first the lands of the tribals were looted, then their women were cheated, now the tribal leaders and youth upholding tribal interests are being physically eliminated and their women are being forced into prostitution and sexual exploitation. Papaiah said that the demand for declaring

Bhadrachalam a tribal district is now urgent and essential to ensure basic security for the tribal people. He said the moves to amend the Land Acquisition Act 1894 (1984) and the Land Transfer Regulation Act (1 of 1970) were aimed at facilitating easy and total control over the natural resources of the agency areas. Until now it was a sort of internal colonialism, disguised and covert, in the agency areas, which is inconvenient for the speedy exploitation by multinational corporations. Now the new economic policy wants to facilitate the process of unhindered and overt colonisation, which he said, has to be fought by tribal and non-tribal poor jointly. He said that the current phase of tribal transition is critical, as it would either eliminate tribals as peoples if there is no concerted resistance, or would become a new era of dignity and pride to the tribal people through self rule if they succeed in resisting the current changes.

Other speakers included Sri Ramulu, Tribal Teachers Federation; T Bharati, president, Adivasi Vikasa Parishad, Vizianagaram district; Aswapati, BSP contestant for assembly elections from Bhadrachalam; Kunjam Venkateswarlu, tribal leader; Kunja Sitaramulu, secretary, Tribal Teachers Federation; P Laxmaiah, Adivasi Sangheebhava Committee; and representatives of tribal student and youth organisations. Tribal cultural activists Paayam Muthayya, Girijana Kumari, Sri Ramulu, Jagan and others presented cultural programmes.

M Papaiah read the resolutions passed by delegates conference in the public meeting. These are:

(1) The demand for a separate tribal district constituting agency areas of Bhadrachalam and Burgampad is several years old and is supported by several political parties. The area has large tribal population and is a contiguous region. Bhadrachalam district must be carved off Khammam as a separate tribal district immediately to ensure safety to tribals and effective implementation of development programmes and participation of tribal people in governance.

(2) The moves to lift Land Transfer Regulation Act are anti-tribal and anti-poor in the agency areas of the state. Already the illegal control and hold of non-tribals over the tribal lands is rampant. Instead of enforcing the legislation into practice to ensure tribals livelihood with dignity, the present moves to lift the act are retrograde. Such moves would result in making lakhs of tribal people into landless within a short time. It would legitimise ill practices that are considered criminal or offences in regard to the tribals according to the existing legislations in the agency areas. Such moves are severely condemned. The LTRA should not only continue to operate without any amendments but also must be implemented effectively.

(3) The proposed Polavaram dam across river Godavari submerges above 350

settlements, predominantly or exclusively tribal, in the agency areas of Bastar, Malkangiri, Khammam, East Godavari and West Godavari. The dam would result in cultural genocide of the Koya tribe as it would disintegrate around half the population of the community. Attempts by the state government to get clearances and financial support without any rehabilitation programme and consent of the oustees is highly anti-people. The state government must immediately declare the project as withdrawn to avoid severe ecological imbalance in the eastern Ghats and extinction of one of the largest tribes in the state. Ecologically and economically the project is a catastrophe and it must be withdrawn.

(4) Several clauses in the proposed forest bill are against the interests of tribals. Clauses like 'carrying capacity', 'powers of settlement officers', 'classification of the forests', give arbitrary powers to the forest officials which deny the rights of the forest dwellers guaranteed by the earlier and present forest legislations. The free play of the smugglers in the forest areas with the covert political patronage would further intensify as the proposed forest bill further alienates the tribals from the forests.

(5) Atrocities against the tribal people in general, and tribal women and their leaders are growing in the recent past. The responsible authorities employed for checking such atrocities are inordinately delaying the justice due to the victims, obviously under the pressure of local vested interests. As a result the feeling of insecurity among tribal people is visibly growing. The conference condemns the growing atrocities on tribal people.

(6) The conference unanimously urged three-fold alternative solutions to end the growing atrocities and multi-pronged assaults on tribals, viz.

- (a) granting self rule to the tribal regions by effective application of the Sixth Schedule of the Constitution,
- (b) introducing three-tier system in the tribal region as specified under the Sixth Schedule and granting district adivasi council with full legislative and executive powers to deal with the affairs related to land and forest management, utilisation of water resources and all other matters related to the normal civic life in the villages.
- (c) Altering the law enforcing agencies in the immediate context to deal with the offenders in regard to the land, forest, tribal women issues.

(7) Until the provisions of Sixth Schedule are put into vogue, the elections to the local bodies in the agency to be held under 73rd Amendment (Panchayat Raj) must be kept in abeyance.

It is emphatically urged in the light of constitution of the Bhuria Committee by parliament to look into the varied dimensions and possibilities of operationalising tribal self rule.

Latin American Liberalisation and US Global Strategy

James Petras
Todd Cavaluzzi

Liberalisation is not merely a 'development strategy' elaborated to facilitate Latin American integration into the world market. Nor is it an inevitable product of some immanent 'globalisation process'. Rather liberalisation is a product of US economic policy-makers, bankers and multinational corporations allied with Latin American transnational capitalists. It is specific class and state interests (not world system imperatives) that dictate the new liberal political economy. In this sense reversing liberalisation must begin at the national level within the class structure and move upward and outward.

THERE are a number of explanations for the liberalisation policies that have been applied in Latin America. One school argues that there is a nationalist-populist policy cycle, which begins with state intervention, nationalisation and protectionism; consolidates an 'import-substitution' development strategy, then enters into crises because of growing state and trade deficits, macro-economic imbalances and declining competitiveness leading to the initiation of the 'liberal revolution'. Another line of argument focuses on the growth during the 1970s of a class of transnational Latin capitalists linked to the world market and benefiting from state sponsored export strategies who became the central nucleus defining the strategy of liberalisation. A third school emphasises the role of foreign debt and the leverage and influence of the World Bank (WB) and the International Monetary Fund (IMF) in imposing the liberal agenda as a condition for refinancing the debt. Others emphasise class conflict and the changing relationship of class forces, both internally and externally. According to this line of inquiry a coalition made up of the national bourgeoisie, the working class and peasantry, which formed the basis of the import-substitution strategy, broke apart as a result of a 'squeeze' on profits and state resources, leading to a new coalition of military regimes, linked to an export bourgeoisie in partnership with MNCs. Parallel to this internal shift the collapse in eastern European 'socialism' eliminated an alternative source of funding and markets, forcing Latin regimes to adapt to the demands of the remaining global powers – the advanced capitalist countries.

There is no doubt that all of these explanations provide us with a partial explanation. The import-substitution model did enter into crises – though it is not clear that it had exhausted its economic potential. The possibility of 'deepening substitution'

of moving from consumer to durable goods to capital goods production and investment in high technologies was at least a theoretical possibility. What is clear is that *politically* the social coalition had reached an end – with the class issues dividing labour and capital creating difficulties in sustaining a common policy. Though the liberal transformation is thus in part a *product* of class conflict, that does not explain the particular economic policies adopted, particularly those unfavourable to national capital.

The second line of reasoning, the growth and hegemony of a 'new' capitalist class linked to overseas circuits and thus a determinant force in bringing about the liberal transformation does refine the previous argument by identifying a particular segment of capital linked to export markets, and overseas financial institutions: a social strata that straddles both the 'internal' and 'international' economy. The problem with this argument is that this segment is *determinant of domestic policy but dependent on external institutions*, both political and economic for its economic strategy to succeed. Moreover the 'transnational capitalist' explanation may explain shifts in *country* policies but it fails to explain the *regional* transformation – liberalisation has taken place on a continentwide basis.

The argument about the class struggle and the fall of eastern 'socialism' may have reinforced and accelerated the liberal transformation but the latter *preceded* the collapse of the Wall by at least a decade. One could just as easily argue that the liberal transformation caused the demise of socialism as much as that the latter brought about the ascent of the former.

The explanatory paradigm in which the IMF and WB play a decisive role in the liberalisation process certainly is a powerful one: their regional reach, the uniformity of their prescriptions, the powerful leverage they exercise and the high correlation

between their prescriptions and regime implementation of their policies suggest that they indeed had a major hand in engineering the liberalisation process.

Nevertheless one is left with several questions. If the WB and IMF are important actors, the internal composition of these institutions reflects the principal donor countries, primarily the US, Germany and Japan. However, the policy impact of liberalisation in Latin America has not had a uniform effect on all three central powers. The IMF and WB strategies are themselves shaped and given substance by the competing economic superpowers.

In this context, liberalisation in Latin America should be examined not merely as an outcome of local ruling segments or MNCs and international financial institutions, but rather shaped by the strategic economic needs of the US state. The primary fact in the post-communist world is the increasing competition for dominance of world markets by the US, Germany and Japan. Each economic superpower has carved out regions of domination from which to reach

out to undercut competitors. The US has over the past two decades lost competitive advantages in a number of product areas (automobiles, electronics, etc.). As a result the US has been piling up a huge trade deficit both with Japan (and other Asian countries) and to a lesser degree with Germany. The withdrawal of US troops from Europe/Japan means that NATO and other military alliance no longer serve US policy-makers as 'economic-political leverage'. Threats of 'commercial war' are two-edged swords that can adversely affect US exporters and importers (and low wage domestic consumers of cheap foreign imports). The line of least resistance and the one most congenial and compatible with historic US policies (Monroe Doctrine, Panamerican Union, Alliance for Progress, etc) is a regional bloc strategy in which the US as the major hegemonic power can extract trade, investment, interest and royalty surpluses from Latin America. From this vantage point Latin America (and Canada) are strategic sources for the accumulation and transfer of profits, interest and royalty payments to the US to compensate for the negative transfers to other regions. The US trade surpluses with the Latin American countries serve to compensate for the negative trade balances with Asia and western Europe. Low cost production in Latin America (cheap labour in Mexico, Caribbean) allows US producers to compete overseas and in the US market with global competitors.

In this context the liberalisation of Latin America was essential to providing US capital with access to markets and earnings to remain globally competitive. In this sense liberalisation is intimately linked to US strategic global interests. This policy is a product of a consistent continentwide push by the US from the early 1970s. Liberalisation was pursued via the IMF and WB through US representatives: Latin dictators who promoted liberalisation were financed and supported; electoral transitions were brokered by Washington on condition that the new electoral regimes deepened the liberalisation process. In a word liberalisation as a regional strategy is part and parcel of US strategic global policy: Insofar as liberalisation 'works', it has worked primarily for the benefit of US MNCs and banks but most importantly for the US political economy as a whole. Liberalised Latin American economies provide strategic benefits to the US in balancing its external accounts. In the following section we will analyse the different forms (types) of return by which US has benefited from its hegemonic relation – through MNC investments, bank loans and royalties.

ROYALTY AND LICENCE PAYMENTS

The US battle to include 'intellectual property' clauses in the GATT agreement

is based on the fact that royalties and licence fee payments have become increasingly important to the US balance of payments (Table 1). Between 1972 and the first quarter of 1994 royalty and fee payments totalled 1.06 billion dollars. Between the 1960s and the 1990s royalty and licence payments skyrocketed: 1962-71 average payments per year were \$ 2.6 million; 1972-81 they grew to average payments of \$ 24.2 million and in 1982-91 to \$ 39.5 million and during 1992-93 the yearly average was \$ 189.8 million. Royalty/licence payments are a form of *rent* that are not based on either investing in productive facilities or financing production. Royalty and licensing payments withdraw income without adding value.

The growing importance of 'rentier income' to US external accounts is evident when we compare US earnings from investments to payments for royalty and licences. Between 1961-71 total licence and royalty payments were one-third of total profits from direct investment, \$ 26/76 (in millions); between 1972-81 the royalty and licence to profits ratio declined to 6 per cent, \$ 242/\$ 4,176 (in millions); during 1982-91 royalty payments amounted to \$ 395 million dollars while direct investment to Latin America resulted in a \$ 373.9 million dollars loss. Between 1992 and 1993 the net royalty and licence payments were three times greater than profit remittances.

DIRECT INVESTMENT PROFITS

In the 20-year period between 1962 and 1981 US multinational corporations remitted \$ 4.25 billion to the US. This was the boom period of the Latin American economies. Particularly during 1972-81 US corporations benefited from the first wave of liberalisation and the huge influx of overseas financing (Table 2).

However with the onset of the world recession in 1982, the debt crises and the Structural Adjustment Policies (SAP) caused the Latin market to shrink, consumer spending declined and most economies in the region went into a tailspin. The negative effects of massive channelling of resources to meet debt led to a precipitous decline in direct investment payments to the US. During 1982-91 there was a net loss of \$ 373.9 million. As we shall see below, there is an inverse relationship between interest payments and profit remittances: as the banks extracted vast sums of interest and principal payments, profits from productive investments declined. Nonetheless the debt crises provided leverage for the IMF/World Bank to push for the privatisation of public enterprises – many of which were purchased by US multinationals. As the limited economic recovery took place, US profit remittance also recovered. Between 1992

and the first quarter of 1994, \$ 150 million in profits were remitted – an improvement over the dismal performance of the 1980s but far below the levels of 1972-81. The debt crises, and SAP not only had an adverse impact on the Latin American economies but a substantial negative impact on the profit payments on US MNC.

INTEREST PAYMENTS

The principal source of private payments from overseas economic activities has been interest payments. The growing liberalisation of financial circuits and the conversion of the US into a 'financier state' or creditor to Latin American private and public investors led to heightened debt burdens. Spiralling interest rates led to a massive increase of interest payments to the US (Table 3). Interest payments from Latin America to the US were an important counter-balance to the US deficit with Japan and Germany. Thus while the US was a creditor to Latin America, it was a debtor to the rest of the advanced capitalist countries. The total interest payments transferred from Latin America to the US between 1972-92 amounted to over \$ 233 billion dollars, of which \$ 206 billion was transferred between 1982 and the first quarter of 1994. These vast transfers had a very negative impact on Latin American growth, imports and domestic demand, but provided the US with a sizeable source of income to compensate for its deficits with Japan and Germany. 'Liberalisation' has the effect of increasing interest and rent payments to the US at the expense of the growth of productive assets. Liberal economic policies increased outflows of interest payments while facilitating the sale of licensing and patent agreements. Privatisation opened public enterprises to buyouts and revived the prospects for the return of profit payments.

The flows of payments to the US show a spectacular overall increase with the deepening of liberalisation – particularly interest and rent payments. It is no wonder that 'free market' policies have become the keystone of US policy and is one reason why US policy-makers are willing to support 'free market' electoral regimes against military coups.

US-LATIN AMERICAN TRADE

If we turn to examining the US trade surplus with Latin America we add another dimension of the asymmetrical relations of the US to Latin America and the underlying reason for US support for 'free trade agreements'.

From the 1960s to the beginning of the 1980s 'debt crises', the US had a substantial trade surplus with Latin America. During 1962-71 the US average annual trade surplus amounted to \$ 426 million; between 1972-81 the annual trade surplus grew to \$ 4,345 million. The surplus turned to a trade deficit beginning in 1983 and continued till 1989. The average yearly deficit during 1982-91 amounted to \$ 1,725 billion (Table 4).

With the 'economic recovery' the US once again began to accumulate a trade surplus between 1992 and 1993, an annual surplus of \$ 2.2 billion. The trade surplus of the US

grew during the first decade of liberalisation (1970-82). With the debt crises and the structural adjustment programmes (SAP) the US exports to Latin America declined while imports increased as part of the Latin American 'export strategy' designed by the IMF to accumulate income to pay the bankers. Nonetheless if we examine the long-term effects of SAP it has opened new opportunities for the US to re-enter and penetrate Latin American markets. If we compare the four years prior to the debt crises (1979-82) to the years after the adjustments (1990-93) we observe that the consequences of deeper liberalisation has been to increase US trade surpluses beyond its historic high points. While on the one hand the debt crises and SAP did result in temporary loss of markets in the long run the structural changes leading to the elimination of protective barriers has led to greater US penetration and takeover of Latin markets.

If we compare the US balance of trade between the US-Latin America to US-Japan in the period between 1970-82, we observe that the US favourable balance in Latin America compensates in part for the deficits with Japan (Table 4). During the debt crises years (1983-89) the US deficit with Latin America was only a fraction of the deficit with Japan. With the economic recovery in Latin America, the US surplus re-emerges but it is only a fraction of the deficit with Japan and barely covers the trade deficit with Germany.

The US loss of trade competitiveness in relation to Japan and Europe was temporarily papered over by the exploitation of favourable trade relations with Latin America. However, the US gains through 'liberalisation' have sufficiently undermined the Latin productive capacity to the point where the surplus from a weak trading region fails to compensate for the deficits with strong trading partners.

CUMULATIVE BALANCE SHEET

If we add the three sources of US income from Latin America (rent, trade interest, profit) and compare to the trade deficits that the US has with Japan and Germany we can begin to understand the strategic importance of Latin America to US global politics (Table 5).

The contribution of Latin America to the US global position can be best understood

by looking at the combined returns from trade, investments, loans and licensing agreements. The data reveal a steady upward movement (the reverse of the US relation with Asia and Europe). During 1962-71, the cumulative return amounted to \$ 6.5 billion; during 1972-81 the cumulative return was \$ 75.5 billion and during 1982-91, \$ 156.4 billion; during 1992-93 the cumulative returns were \$ 38.1 billion (Table 5). The cumulative returns to the US are of strategic importance in reducing the global deficit and compensating for loss of competitiveness in other regions. Without the growing exploitation of Latin America the decline of the US would be more marked and the unfavourable impact on its global position more pronounced.

Between 1962 and 1971 US income from Latin America amounted to three-quarters of its trade deficit with Japan, and was 50 per cent greater than its trade deficit with Germany. In the following decade, between 1972 and 1981, US income from Latin America matched the cumulative trade deficit with Japan. In the past decade, between 1982 and 1991, while the US doubled its earnings from Latin America, its cumulative trade deficit with Japan increased almost five and a half times and its deficit with Germany increased seven-fold. The same pattern seems to hold for the present decade. The liberalisation of Latin America has augmented the surplus appropriated by the US, thereby in part compensating for its growing trade deficits with Japan and Germany. The growing exploitation of Latin America is matched by the declining trading position of the US *vis-a-vis* its main competitors in the world market. As the table indicates, Latin America has been of strategic importance to the US in balancing its trade accounts and covering over its declining global position.

LATIN AMERICAN BILLIONAIRES

Parallel to the heightened US exploitation of Latin America the free market policies have led to a profound polarisation of Latin American societies and the growth of a new class of super-rich Latin American billionaires. (The data are drawn from *Forbes*, July 18, 1994, pp 135, 152, 153.) This class is a direct product of the liberalisation process: in 1987 there were less than six billionaires, by 1990 there were eight, in 1991 there were 20 and by 1994 there were

TABLE 5. CUMULATIVE INCOME FROM LATIN AMERICA COMPARED TO TRADE DEFICITS WITH JAPAN AND GERMANY BY DECADE 1962-93

	(Million US \$)			
	1962-71	1972-81	1982-91	1992-93
Income from Latin America	6,330	75,554	1,56,375	38,140
Balance of trade with Japan	8,795	-75,468	-4,32,373	-1,09,356
Balance of trade with Germany	2,730	-13,838	-90,103	-17,242

41. Most of the super-rich were millionaires prior to free market liberalisation; most became billionaires with the buyout of public enterprises during the late 1980s and 1990s. Essentially this class of billionaires with their vast network of media outlets and allies in the state apparatus, control economic policy and electoral processes. In Mexico through the PRI, in Brazil through the corrupt political class, in Chile through the *Concertacion*, and in Argentina, Venezuela and Columbia through the traditional major two parties, the super-rich have gained valuable mining concessions, telecommunication systems, tourist and manufacturing assets.

There are now more Latin American billionaires (41) than there were in most parts of the world in 1987 when Europe had 36, Japan and Asia combined 40, the Middle East/Africa eight, and almost as many as the US (49). The great concentration of wealth in a small group of families is one of the most significant 'success' stories in Latin America: for, these groups have truly entered the top floor of the 'first world' in every sense of the word. It is they who not only have benefited from liberalisation – at the expense of the massive impoverishment of the majority – but who through their links with the liberal electoral regimes have been the major backers of neo-liberal policies.

The process of economic concentration of wealth occurring in Latin America is part of a global process – product of the 'neo-liberal counter-revolution'. Between 1987 and 1994 the number of super-rich billionaires has increased from 49 to 120 in the US, 40 to 86 in Asia Pacific, 36 to 91 in Europe and from eight to 14 in west Asia and Africa. The decline of welfare programmes and the privatisation process have been instrumental in polarising the world between a small group of very rich business families and hundreds of millions of marginalised temporary workers. The notion of centre/periphery does not capture the super-rich classes north and south linked through a multiplicity of investments, financial and trade circuits as well as licensing and pattern agreements. The integration of the super-rich into the global market place and their capacity to direct and regulate the nation-state to finance and subsidise their international links is the most significant fact of global politics. Globalism is the programme of the super-rich.

The parallel growth of the billionaire class in Latin America and heightened US exploitation are dual outcomes of the neo-liberal counter-revolution. This is most evident in the countries which have advanced furthest on the path of neo-liberal politics: Mexico has 24 billionaires and has been the main source of trade, interest, royalty and profit income for the US, followed by Brazil with six billionaires, Argentina, Chile and

Columbia with three each and Venezuela with two. The basic reason for growing poverty and declining health services and educational institutions is the diversion of public resources to the private sector and within the private sector to the very rich. *'Neo-liberalism' is in essence a euphemism for the reconcentration of income through the international regulation of state policy.* Income is transferred upward and outward – leaving the poor to struggle in marginal 'micro-enterprises', informal employment and hand-outs from projects sponsored by non-governmental organisations.

The importance of the liberalisation and privatisation policy for the concentration of wealth and the emergence of the super-rich in Latin America can be glimpsed by looking at the brief biographies published in *Forbes* magazine of a sample of six Mexican billionaires. (*Forbes*, July 18, 1994, pp 186-190.)

The Peralta family, worth \$ 2.5 billion, is involved in a major joint venture with Bell-Atlantic of the US which has invested \$ 1 billion in a cellular phone company.

The Guitron family enterprises are traded on the US stock exchange, and they have climbed to billionaire status thanks to the fortune they made through investment in Banco Nacional de Mexico (BANACCI), the financial conglomerate that arose from the 1992 privatisation of the Banco Nacional de Mexico.

The Salinas Pliego family, worth \$ 2 billion, was enriched through the purchase of the government-owned Television Azteca for \$ 645 million in a joint venture with US, General Electric-owned National Broadcasting Company (NBC) for programming. Jorge Larrea Ortega and family also invested in and profited enormously from the privatisation of the BANACCI. He bought the state-owned La Cananea copper mine for \$ 500 million and now his Grupo Industrial Mineria Mexico is Mexico's biggest mining company producing 90 per cent of the country's copper, gold, silver and zinc in partnership with ASARCO of the US and Belgian Union Miniere with revenues of \$ 1 billion per year.

The Franco family valued at \$ 1 billion became billionaires thanks to a \$ 400 million investment in the privatisation of Telefonos de Mexico and in 1992 a \$ 200 million investment in BANACCI.

Cosio Arino family also became billionaires with their investment in the privatisation of the Banco Nacional de Mexico. In 1991 with the privatisation of the state-owned Mexican telephones, Cosio Arino clan got 5 per cent of preferred voting stock for \$ 50 million which in 1994 is valued at \$ 400 million.

This sample of Mexican billionaires illustrates the way in which state policy (neo-liberal privatisation) favours the concentration of private wealth and the

growing joint exploitation of minerals and penetration of markets by Mexican billionaires and US multinational corporations.

CONCLUSION

Liberalisation and structural adjustment policies have played a strategic role in opening up Latin America to US exploitation and providing a major source of income to compensate for US declining competitiveness in other regions. At the same time, liberalisation has created a new class of Latin billionaires who increasingly dominate politics and the economy and are major partners with US banks and multinationals. The result is reshaping the regional economic structure with greater integration at the top and increasing disintegration at the sub-national level. The neo-liberal policies have also polarised the class structure: the emergence of a new class of Latin billionaires with major investments in the US, as well as joint ventures in Latin America with US conglomerates. The very rich are indeed an integral part of the first world. On the other side is the growth of an impoverished labour force faced with declining state social expenditures, chronically low paid employment, and landless peasants deprived of influence in politics and economy. The majority is paying the price for the admission of the super-rich into the first world.

Liberalisation as the ideology of the hegemonic power in this hemisphere has become an instrument of global competition – and should be viewed as part of strategic economic goals. In any case liberalisation has not and is not merely a 'development strategy' elaborated to facilitate Latin American integration into the world market. Nor is it an inevitable product of some immanent 'globalisation process'. Rather liberalisation is a product of US economic policy-makers, bankers and multinational corporations allied with Latin American transnational capitalists. It is specific class and state interests (not world-system imperatives) that dictate the new liberal political economy. In this sense reversing liberalisation must begin at the national level within the class structure and move upward and outward.

A Japanese View of Chinese Threat

S P Seth

Japan is perturbed over China's growing naval strength as it may lead to escalation of tensions in the Asia-Pacific region.

CHINA's growing military strength has been a matter of growing concern in the Asia-Pacific region, so much so that voices are being heard in Japan about a security threat from China. The Japanese are generally reticent on this. But not professor Shigeo Hiramatsu who teaches Chinese studies at Kyorin university. In a recent article in *Japan Review of International Affairs* he dwells at length on the Chinese threat. He points to a series of assertive Chinese claims and activities which portend trouble. These are: (1) The promulgation of a law in February 1992 establishing China's sovereignty over south China sea islands, including the spratlys on which claims have been made by other regional countries too. The law also lays claim to the Senkaku islands in east China sea, which Japan claims to be under its control. The law also places, the seas surrounding these islands under Chinese sovereignty. (2) As a sequel, Chinese marines landed on Da Lae reef in the Spratlys to plant a sovereignty post. (3) Further assertion of Chinese sovereignty came, when Beijing awarded a US oil company the right to develop oil resources in an area claimed by Vietnam. The concerned US company was assured that the Chinese navy would defend the former's oil exploration operations from outside interference. (4) Such Chinese claims and activities are backed up by its growing military might, such as: the purchase of 24 supersonic Su-27 fighter-bombers from Russia, 100 S-300 surface-to-air missiles with four launchers, and five Il-76 transport planes.

There are reports that Beijing is likely to purchase more lethal weapons and equipment from erstwhile Soviet republics which include an aircraft carrier, kilo-class conventional submarines, heavy backfire bombers, aerial refuelling technology, and T-72M tanks. Little wonder that China's defence budget has gone up by about 50 per cent in the past few years. The increase could well be greater since official defence budgets in China grossly under-report military expenditure.

It is true that the Chinese navy does not measure up to American or Japanese standards. But there have been both qualitative and quantitative improvements in the Chinese navy since the 80s. According to Hiramatsu, "The ships in the People's Liberation Army's (PLA) navy may be outdated on the whole, but over the past dozen years or so, missile-equipped destroyers and conventional submarines are being built at a rate of one per year, and missile armed frigates at a rate of three per year.

The destroyers and frigates are being upgraded and updated to accommodate sophisticated electronic equipment or carry helicopters. They are being built without portholes and are otherwise sealed to withstand nuclear warfare" China is said to be developing a second generation submarine-launched ballistic missile with three stages and a range more than 8,000 kilometres. It is also building a nuclear submarine to carry these missiles.

Apparently, all this is being done in pursuance of a clear strategic doctrine. According to Lin Zhiye of the Dalian Naval Vessels Academy, where key naval personnel are trained, the PLA navy aims to achieve (i) a fairly large radius of action, including the capability to wage war in the surrounding seas; (ii) the ability to control the sea and the air space in a given area independently; (iii) a strong rapid response capability; (iv) a strong amphibious capability, and (v) the ability to threaten others with its nuclear capability.

However, China does not expect in foreseeable future any major armed conflict in the region, though it predicts certain local conflicts. According to professor Zhang Jingyi, new and old border disputes, such as the Chinese invasion of the islands in the south China sea, are intensifying with each passing day and may not necessarily wait till the next century, a justification, perhaps, of China's annexation of these islands in 1992. Zhang Jingyi finds the direction of future conflict shifting towards the high seas and hence, the importance of naval power to China.

Nevertheless, Beijing hopes that it might not have to use its naval power to achieve its objectives. As Lin Zhiye opines, "Only when a country possesses a mobile fleet can it hope for political and diplomatic solutions whereby one vanquishes the enemy without striking a blow... but when the threat fails, there is the option of delivering an actual strike".

In the context of China's threat to the Asia-Pacific, Hiramatsu is most worried about the wrangle between China and Japan in the east Asia sea, particularly regarding the Senkaku islands. The east China sea is supposed to be rich in oil and marine resources, which also explains China's assertive ownership over the islands in the south China sea. The Japanese fear that though at present China has concentrated on the south China sea, it would not be long before it fixes its eyes on the east China sea. Thus, Japan cannot remain indifferent to the Chinese designs in the east China sea.

Teachers' Salary Scales

Case for a Fresh Look

Amrik Singh

The issue of pay scales for teachers needs to be looked at afresh, especially that of parity between undergraduate and postgraduate teachers. Some differentiation between different levels of teaching needs to be created to encourage academic excellence and to improve the performance of colleges. The concept of an academic ladder needs to be amplified.

I

WHENEVER the issue of emoluments payable to teachers is discussed, generally the emphasis is on the scale of pay that goes with a job at a particular level. This is understandable. In the hierarchical world in which we live, the scale of pay is important. The question generally raised is: is it higher or lower than another equivalent job? In plain words, the question of hierarchy and the related dimension of vertical mobility is seen to be important.

In this respect, the pay commissions which are appointed every few years have on the whole done (within limits) quite a job of rationalising the system. Almost every pay commission claims, amongst other things, that it has brought down the number of pay scales that had been in force earlier. The intention is not to have too many pay scales; a multiplicity of pay scales causes confusion and even leads to malpractices.

In this respect, Pakistan has done an impressive job. In the early 70s, when Bhutto was in power, the system was both rationalised and streamlined. All employees were fitted into one of the 22 scales that the country decided to have for itself. A driver, for instance, wherever he is posted, would be in the same scale of pay, and so on. Skills and responsibilities have been identified and slots accordingly created. For almost a quarter century, the system has run fairly well.

In our country, a kind of breakthrough was achieved in respect of university and college teachers when the 1973 scales were introduced. In respect of university teachers, a kind of parity had existed with Class I officers in the government of India. Now this umbrella of parity was extended even to college teachers. This issue, though important, does not have to be discussed here. But a reference to one minor dimension of the problem might be in order.

When, in 1986 in the wake of the report of the Mehrotra Committee, the issue was being processed, the question arose: with whom to equate university professors? In line with the general thinking that teachers

have to be paid well, it was decided to put university professors one notch higher than a joint secretary. To equate them with a secretary would have been laying it thick. Therefore, a kind of compromise was made and university professors were equated with additional secretaries. It may not be out of place to mention here that the government of India does not have more than 200 persons in this rank. Those in the same scale in other departments number another 250-300. Even a Lt General in the Indian Army is in the same scale.

The more pertinent issue is that there are hardly more than a dozen or so Lt Generals in the army, whereas university professors number around 10,000 already. In course of time this number would increase.

An average teacher is not even aware of this parity having been established at these two levels of appointment. That the job of a professor is highly remunerated is a matter of remote concern to him. Most of them are not likely to reach that level of seniority. What is, however, of much greater concern to him are issues such as: How he is regarded by others? How he is perceived by society in general? Is he given the kind of regard or consideration which others drawing the same scale of pay would receive? What about facilities such as housing, medical care, transport and several other perks which are of much greater consequence to him? All these are issues which concern him intimately and deserve to be looked at somewhat closely.

II

At this stage, a distinction needs to be drawn between private employment and government employment. In the private sector, salaries are high and the perks are equally lavish. It all depends upon the level at which one is working and the responsibility that goes with the job. During the days when everything was controlled by the government, certain limits had been fixed in respect of remuneration, etc., in the private sector. But with the liberalisation of the economy, most of the restrictions have gone and the rest would also go in the years to come. Anyone

working in the private sector, therefore, can look forward to an exceedingly handsome level of remuneration.

In the government or the public sector, things are regulated much more rigorously than in the private sector. Rules are prescribed. Who is empowered to relax those rules, and up to what limit, are also clearly and specifically laid down. In plain words, there is little room for flexibility. In certain jobs, however, there are more perks and facilities than in other jobs. Some of them are therefore much sought after because they promise a better deal.

In the public sector, for instance, access to transport is easier than in the government; the same is true of travel as also entertainment. Therefore, these jobs are coveted. When teachers hear about the lavish hospitality expenses available to some categories, they forget about the parity that they have with certain categories of employees and their attention is immediately switched on to what others have and what they themselves do not have.

Envy is a strong human characteristic and is at work in each country and in every system. It was said about the erstwhile USSR that as many as 18 million persons belonged to what was called the managerial class. It was a privileged class; to some extent it was even a self-perpetuating class. Among the worst sufferers of the collapse of the communist system have been these 18 million employees. During the days of the command economy, they wielded enormous power and that is what set them apart from the rest.

In our situation, the Indian Administrative Service has to some extent established the same kind of pre-eminence over the years. In fact, they wield so much power that it is they who more or less decide what scales of pay, perks and facilities would be allowed to other services. There is a certain kind of undisguised hostility between those who belong to the IAS and the rest. On occasions it even assumes the form of confrontation between professionals and generalists.

It is not necessary to go into these wider issues, but one issue certainly requires to be considered. Should the pay scales of university and college teachers be decided with reference to what is payable to Class I officers? Why cannot these teachers be paid more or less, as the case may be. To link their scales of pay with those available to any category of government employees, even if they belong to Class I, is to concede the point in principle that all decisions have to be made with reference to what is payable to those in the government.

It is true that these employees are very numerous and in sheer numbers they dwarf all others. It is equally true that this system has prevailed more or less from the 19th

century onwards. But now that we are poised to enter the 21st century, is it not time to delink the two spheres of activity? In other words, an integrated and socially rational and just view of what is payable to teachers ought to be taken. This means that teachers at every level, from the primary to the university level, ought to be viewed as members of a distinct profession. How they are to be paid and what differential is to be maintained between the different levels of jobs is an issue that deserves serious and independent consideration.

The Teachers' Commission-II, which dealt with university and college teachers, did not go into this issue except in a general way for the simple reason that a UGC-appointed committee under R C Mehrotra was already at work on it. The other commission which dealt with school teachers was not inhibited by any such consideration. It therefore examined the question of salary scales and made specific recommendations.

The point which deserves to be underlined is that teaching is a distinct profession. Emoluments payable to different categories of teachers do not have to be determined by considerations which are applicable to government employees. Their conditions of work are different and therefore they should be dealt with differently. If there can be any kind of an analogy, it can only be with a related profession like health. Both teaching and health have a good deal in common; both are service-oriented professions. If some kind of parity or correspondence is maintained between the two, that would be in order. To seek to maintain any such parity between teachers and other government employees is not in order.

III

How the issue of salary scales for university and college teachers has been handled can be broadly divided into two phases. The first phase extended from 1947 to 1973 and the second phase which began in 1973 continues to this date.

This is the general picture. In between there are details, and only the more relevant ones may be referred to. For instance, the significance of the 1973 scale was that though university teachers had been generally equated with Class I officers of the government of India, this parity was extended even to college teachers. This was the principal significance of the pay revision in 1973.

Owing to a variety of reasons which cannot be gone into here, even before the next revision took place in 1986, the central government had conceded one thing, which indeed it tried to undo in 1986. After a prolonged strike of 110 days in Delhi university in 1982-83, the centre conceded what came to be called automatic promotion from the lecturer's scale to the reader's scale. This amounted to going beyond what had been sanctioned in 1973.

When the revised scales were announced in 1987, the organised teacher opinion opposed it for two reasons. One, having conceded more than it wished to do, an attempt was made in 1986 to recover the position, and this did not please the teachers. The lecturer's scale was now proposed to be subdivided into three stages and the reader's scale into two stages. While the latter proposal was eventually withdrawn, the three stages of the lecturer's scale were retained. This somewhat amateurish move did not help.

To quite an extent, movement from one sub-stage to another has been more or less automatic. Even in the case of lecturers getting the reader's scale without much fuss the situation is not significantly better. Quite a few lecturers at least in one university have managed to get the designation of reader. Not only that, the internal control system, which normally regulates movement from one stage to another, has become exceptionally weak and ineffective.

Though this is not the only explanation for what has been happening, an important point that needs to be made is that in academic terms, it was a miscalculation of the first order when in 1973, postgraduate and undergraduate teaching were equated with each other.

In any academic system, there has to be a certain hierarchy of jobs. Such a hierarchy exists everywhere. In the academic world, movement from one stage to the other betokens some growth of knowledge and competence and a certain measure of creativity. To prescribe that everyone would be in the same scale of pay, whatever he is teaching and wherever he may be located, may have solved one problem (getting a living wage for everyone), but it has created another problem. It has destroyed for all purposes the notion of climbing up the academic ladder. With that notion undermined, movement from one stage to another declined for the most part. This in turn has led to academic degeneration which is one of the problems that the system has to face today.

Another adverse by-product of this decision has been that autonomous colleges, which had been projected as a feasible solution to the problem of declining standards at the undergraduate level, have failed to take off. The absence of any distinction between these colleges and other colleges was a strong contributory factor. If teachers in both categories of colleges have the same scale of pay, why should anyone prefer to work in an autonomous college? Such a college demands much more of a teacher than what his counterparts in other colleges do or are required to do. There are of course other reasons why autonomous colleges are not being established. One of them most emphatically is that, in terms of salary scales, there is no distinction between the two categories.

IV

Now that the issue of salary scales is to be reconsidered afresh, the assumptions which govern who is paid how much and at what level would have to be re-examined. A question that would have to be asked and answered is whether the 1973 decision to equate postgraduate and undergraduate teachers was academically right and tactically advisable.

As to the academic argument, something has been said already. As to the tactical angle, this was a mistake which it would be difficult to undo now. More than 85 per cent of teachers are engaged in undergraduate teaching. If a decision which affects such a large proportion of them adversely is proposed to be taken, it stands to reason that it would be strongly resisted. This became abundantly clear when an all-India strike took place in 1987. When it was called off, it was the university teachers who felt betrayed. As far as the college teachers were concerned, they may not have got everything that they wanted but they did not emerge too badly mauled. The bulk of the leadership of the strike also came from colleges. It was therefore anxious to ensure that the bulk of its supporters did not feel let down.

As and when such a move is contemplated, the same story would repeat itself – any decision which goes against the bulk of the teachers cannot but be resisted. Whether the policy-makers would be assertive enough to do the right thing would depend upon their political judgment as well as their moral stamina.

About one thing there should be no doubt. To persist with the existing arrangement – lack of differentiation between two levels of teaching – is not sustainable. In financial terms, it imposes an additional burden on the funding authorities. In academic terms, it hits at the very root of academic mobility as also academic excellence. In a way, it is a classic situation where the tail wags the dog. Because the teacher leadership is by and large controlled by those coming from colleges, those working in universities cannot make themselves heard or their point of view accepted.

It may not be out of place to mention here that after the strike had been called off in 1987, it continued for quite some weeks both in Delhi and Bombay. The demands were different in the two places. In Delhi, the teachers did not get anything for having remained on strike. Whatever had been conceded had been won by them earlier.

In Bombay, the demand was for parity of payment between college teachers and those working in junior colleges. Despite a prolonged strike, the Maharashtra government did not accept that demand. To have done so would have obliterated the difference between undergraduate teaching and school teaching.

At the university level the principal issue is exactly the same. To do away with the difference between undergraduate and postgraduate teaching may please those working in colleges, but is not conducive or helpful to the academic process as a whole.

As indicated elsewhere, there is one way in which the centre can deal with this issue relatively easily. Instead of the centre continuing to assist the states with funds to put teachers on the central pay scale, as it has been doing for about three decades, the centre can adopt the attitude that this is something which should be handled by each state as it deems fit. This is not a new proposal; it has been mooted several times and for a couple of decades.

The issue has also been discussed in connection with the working of the UGC. That the UGC should only deal with universities is a manageable proposition. When it is required to deal with more than 7,500 colleges also, it finds it difficult to do so. One solution proposed was that as the states alone deal with school education, they alone should deal with undergraduate education also. Neither the UGC nor the centre nor any other agency should have anything to do with education at that level, though they may indicate what requires to be done and so on. Professional education, however, is a different proposition and could continue to be dealt with through the various professional agencies established for the purpose.

This need not be empty talk – such a rearrangement can be worked out and implemented. The UGC is finding it difficult to deal with several thousand colleges; the establishment of regional centres is a pointer in that direction.

Whether central subsidies to states so as to help them to fall in line with central universities is 50 per cent, 80 per cent or 100 per cent is a matter of convenience, and there is no administrative principle or statutory sanction behind it. If, for instance, at the time of the next revision the centre reduces it to 50 per cent, there would be no problem about it. Different states would act differently once that is done. Even after the 1973 revision, each state did not accept the central formula and at least two of them, Kashmir and Kerala, did not fall in line fully.

There should be no great problem in having different scales of pay in different states though, to be sure, within certain broad parameters. The present situation came about owing to historical reasons and can be reversed. Historically speaking, teachers were grossly under-paid till 1973. In order to improve their emoluments, the centre played an aggressive role. Need the centre continue to promote this notion when the objectives of better productivity and better performance have not been achieved? In this

situation, it would be tactically advisable to let each state deal with the matter as best as it can. The all-India initiative which got projected in the early 70s has not done much for the academic system.

V

Coming to autonomous colleges, two things should be understood clearly. With a large number of substandard colleges being established all over the country, undergraduate education would never get out of the morass into which it has sunk. As argued elsewhere, the real problem is that the examination system has become a drag; and no reform can take place unless the mode of assessment is reformed. To reform it on a large scale (so as to cover a whole university) requires great effort. The system does not seem to be capable of it.

Therefore, the only alternative is that the scale of operations is reduced. Once the college becomes a unit of operation, the scale would become manageable. The next two tasks then would be how to ensure that colleges perform well and, second, how to judge the performance of colleges. Not having crossed even the first hurdle, it seems unrealistic to talk of how to deal with the second hurdle, which undoubtedly it would be.

But colleges refuse to claim autonomous status because in the existing easy-going atmosphere, they are hardly accountable for anything that goes wrong. Things are both diffused and lax. No one can be held responsible if anything goes wrong because no one is given the specific responsibility to do a particular job. If anyone is responsible, it is the principal, and he fails to perform because, generally, he is unable to carry the teachers with him.

As stated already, there is no incentive for colleges to become autonomous. Teachers get the same scale of salary everywhere, and if some of them are committed and more capable, there is nothing to prevent them from performing better as individuals. The system however does not change. Several hundred colleges in the country even today are performing well, though it must be conceded that they could perform much better if things were arranged differently. In point of fact, almost half the colleges in the country have the potential to perform better provided they are put on their mettle and are required to perform.

Parity between undergraduate and postgraduate teaching has thus become an obstacle in the path of academic progress. Because there is no incentive for colleges to become autonomous, not many of them have become autonomous. The hundred or so that are autonomous are unable to generate any momentum. It is when something like 1,000 or so are established that a separate sector of colleges would begin to grow. Perhaps a few hundred of them can be

established without much difficulty and then every year a few hundred more can be added.

Once they cross the magical number of 1,000 and once they are delinked from the colleges and then salary scales are linked with universities, the situation would start changing. The key to unfreezing the existing situation is that autonomous colleges are given the same status as university departments, and the others are not conceded this privilege. Once this happens, the good old academic ladder of climbing from one step to the other would re-assert its primacy and the situation would get unfrozen. Nothing short of such a drastic remedy would unleash the potentially creative forces which now are not being allowed to play a role and assert themselves.

VI

The concept of the academic ladder needs to be amplified somewhat. Everyone must start with a living wage; regarding this fact there need be no misgivings. That this should correspond to what others of equivalent standing enjoy goes without saying; it is after that a differential system should be established. Perhaps an analogy would help. In the armed forces, whoever joins as an officer gets a few promotions based on the length of his service. After that, the element of selection comes in, which is very rigorous, indeed more rigorous than in civil employment.

There is no reason why progress in the academic field should be any less rigorous. In the kind of society which each country is trying to build for itself, the role of education is central. Therefore what kind of talent gets attracted into the teaching profession is a matter of considerable significance. The first important step is to attract the right kind of talent, and the second equally important step is that talent is recognised and nurtured. One way of destroying it is to promote people even when they do not deserve to be promoted. This however should not mean that there has to be a wide margin between the top salary of one who has merit of a high order and one who is lacking in it. As argued by the Mehrotra Committee also, the difference need not be very wide, but the difference must exist so as to underline the point that merit gets rewarded and receives its own recognition.

There is also a related aspect. One of the reactions to the 1973 revision of scales was that the salary gap between high school and college teachers was much too wide. There was some substance in the criticism. Since then attempts have been made to bridge the gap somewhat, but nothing like a rational system has yet evolved. One of these days this would have to be done.

In theory there can be some disagreement about what has been stated so far. The more pertinent question, however, is to what extent

a good deal of it can be implemented. It requires no effort to prove that since all decision-making is political, the calibre of political leadership is crucial. The fact of the matter is that for over four decades a certain strategy of development has been followed. It is open to many objections and these have been articulated meticulously and relentlessly by several people.

The feeling of dissatisfaction with what exists is there, but an alternative strategy has not yet been evolved. Even the much-applauded post-1991 liberalisation has not brought about a shift of gears to the extent required. In fact, the economic changes are not being supported on the political plane as much as they ought to have been supported. That is the sad situation today.

VII

To make any assumption, therefore, that changes of policy, however advisable, would be put into effect may not be particularly realistic. In this connection two further points may be made. The first one relates to the experience of other countries. Except in the USSR, no other country in recent history has paid academics and scientists as generously. That was the only country which made extraordinary efforts to draw abreast of those countries which had gone ahead of her, and even tried to overtake them. That she succeeded to some extent in doing so cannot be questioned even though that country, as a political entity, has ceased to exist today.

In every other country, teaching is at best adequately paid. This fact however has not prevented other countries from attracting talent into teaching. Remuneration is not the only thing that matters; the prestige of the profession and its contribution to national life is equally important. What is called prestige is so difficult to define that to seek to specify or define it would be a vain effort. Basically it is the contribution of a profession like teaching which would tilt the scale in its favour. If academics are performing well and those who pass out go on to make an impact on social and economic life, their prestige would go up. But if their contribution to social and economic life is undistinguished, it would work against them and there is no question of their being looked up to. It is in some such situation that the academics in India find themselves.

Second, to delay a decision on this matter would prove costly. Even in 1986 when the 1973 momentum was still in evidence, everyone was not convinced that the right thing was being done. The experiment of coupling undergraduate and postgraduate education had not proved fruitful. But no one in 1987 had the courage to undo what had been done only a decade earlier. A decade after that, that feeling of dissatisfaction is unmistakable and indeed stronger. Remedial steps such as those dis-

cussed above would have to be taken. Whether they are eventually taken or not would depend upon the quality of political leadership and its capacity to see into the future.

VIII

Before winding up this issue, it may be in order to look at one dimension of the problem which is without question technical in nature. Nonetheless it has some bearing on what is under discussion. When the salary scales were revised in 1973, one of the arguments used then was that since examining students was a part of the job that a teacher had to do, henceforth nothing would be paid either for invigilation work or for the evaluation of the scripts. Though not exactly an integral part of the argument, it was used to disarm the opposition that was being encountered in the cabinet.

It is known widely that two people who opposed university and college teachers being put in the revised scale of pay were Jagjivan Ram and Swaran Singh. Both of them did so more or less in line with the existing social attitudes. These had been shaped largely by the kind of colonial economy which the British had built right from the middle of the 19th century and which, for the most part, remained intact even after 1947.

Indira Gandhi's attitude however was more positive. In the kind of social scenario that was emerging, she wanted to co-opt teachers at this level into the middle class circuit, and therefore she was for accepting the proposal. Not many others opposed it except the two ministers referred to above, and the proposal eventually went through.

As stated repeatedly, it was almost a breakthrough. Till then nobody had defined precisely as to where teachers stood. Did they belong to the lower middle class which had been the situation till then? Or did they belong to the upper middle class – the category into which they were now being inducted? The cabinet's decision was most emphatically for the latter alternative.

This argument about not paying remuneration for examination work began to wear thin within a few months. It all depends upon the kind of examination system in force. If it were a centralised and anonymous system, the kind of public examination which has been followed in India for more than a century, and which, because of the burgeoning numbers, has been more or less sanctified as the system which suits India's social situation, payment of remuneration was unavoidable. What teachers were required to do was not a part of their normal duty; it was something in addition to that. Therefore they had to be paid for it and this is the system that had been followed all these decades. But if the system was going to be modelled on what was being practised in the US – the teacher testing the student and giving him grades or marks as required – no

extra remuneration was required to be made. The then policy-makers were inclined to lean in the latter direction, and they argued that the system of additional remuneration should be dispensed with.

In practice it was found totally unfeasible. University after university discovered that to get the teacher to invigilate without being remunerated and to examine scripts, again without remuneration, just did not work. In fact even when teachers are paid remuneration, quite a few of them evade this kind of obligation. The situation varies from university to university. In certain cases both invigilation and evaluation of scripts are remunerated. In certain others the former is supposed to be a part of their official duty and it is only the latter which is remunerated. Whatever be the details, the fact remains that the original understanding has not been honoured.

By itself this may not be such a material factor in the situation. But it has a direct bearing on the distinction between affiliated and autonomous colleges. In the case of affiliated colleges, the examination would be controlled by the university and would conform to the existing pattern. Additional remuneration would therefore have to be given. In the case of an autonomous college, the job of testing the students could be done by the teachers themselves. To that extent they would have to go without the income which some of their colleagues would have.

By way of a digression, it might be added that what is paid as remuneration is ridiculously low. Because of the fear of having to go against the understanding which was a part of the 1973 pattern, a large number of universities pay only marginally more than what was being paid before 1973. This in turn has worked as a disincentive apart from the fact that a large number of universities charge a very low examination fee and therefore cannot even afford to pay. In other words, neither is the amount attractive enough nor is it paid in time. In consequence results get delayed much more than ought to happen.

While considering the question of revision of salary scales, it may not be inappropriate, if not imperative, to draw a distinction between affiliated and autonomous colleges in terms of what has been stated above. In order to be consistent however, one additional step would have to be taken. If teachers in autonomous colleges are to be equated with university teachers, as is implied, the latter cannot have a title to any extra payment either. A kind of parity would have to be established between the two. The issue therefore is somewhat more complex than might appear at first sight.

Of this, however, there can be no doubt, that unless the scales of pay in these two types of colleges are different, autonomous colleges would not get established so easily – as has been the experience so far.

Indo-Sri Lanka Discord

S Guhan

Pangs of Proximity: India and Sri Lanka's Ethnic Crisis by S D Muni; Sage Publications, New Delhi, 1993; pp 259, Rs 250.

After such knowledge, what forgiveness?
Think now
History has many cunning passages,
contrived corridors
And issues, deceives with whispering
ambitions,
Guides us by vanities.

— T S Eliot, *Gerontion*

ALTHOUGH the literature on India-Sri Lanka relations in the 1980s is extensive, S D Muni's book deserves particular attention because it is from a leading political scientist who has specialised in India's external relations in south Asia. The author begins by situating India's concerns in Sri Lanka in the wider context of its approach to its neighbours and proceeds to chronicle India's involvement with Sri Lanka between July 1983, when ethnic riots erupted in Colombo, and late 1989 when the withdrawal of the IPKF commenced. The concluding chapter summarises the author's appraisal of the involvement and the lessons that could be drawn from it. Eight documentary appendices add to the value of the book.

Muni provides a well-ordered account of each phase of India's involvement in Sri Lanka's ethnic crisis. The first phase (July 1983-October 1984), viz. Indira Gandhi's period, was when, following the ethnic riots, India assumed a mediatory role with G Parthasarathy negotiating the principles of settlement, known as 'Annexure C', between the Sri Lankan government (SLG) and the Tamil groups. A second track that Indira Gandhi concurrently pursued was to promote and encourage, on Indian soil, various Sri Lankan Tamil militant groups under the direction of the Research and Analysis Wing (RAW). As Muni admits, RAW was asked to penetrate these groups "providing them with training, money and arms to limit their militancy, erode their external linkages and bring them under Indian influence".

In the phase that followed (October 1984-July 1987), Rajiv Gandhi continued with both tracks but was no more successful than his mother in either of them. On the diplomatic front, yielding to SLG pressure, horses were changed in midstream as many as three times in three years: Romesh

Bhandari replaced G Parthasarathy; he was replaced by P Chidambaram and K Natwar Singh; and they in turn were replaced with Dinesh Singh. The Tamil militant groups were legitimised in the Thimpu talks, held under Indian auspices, between them and the SLG (July 1985), in the process undermining the moderate TULF leadership. On paper, the December 19, 1986 proposals formulated by Chidambaram and Natwar Singh were an improvement from India's point of view but, not unexpectedly, the SLG did not buy them just as it had earlier stymied Annexure C by putting it through the All Party Conference that lasted during all of 1984 in Sri Lanka. At this point, president J R Jayawardene opted for a military solution and escalated the conflict with the Vadamarachi operation (May 1987). Rajiv Gandhi then decided for a direct interventionist role for India. By boat and air, relief supplies were sent to Jaffna in June 1987 to be followed by the Indo-Sri Lanka Accord in July.

During the next phase (July 1987-March 1990), to use standard journalese, the ill-fated Accord ran its hapless course to a bitter end. The principal objectives of the Accord were to (a) assure the cessation of hostilities between the Sri Lankan army and Tamil militant groups followed by the disarmament of the latter, (b) promote constitutional and other changes in Sri Lanka to enable the Tamils to secure their long-standing demands in regard to ethnic identity, language, legislative and executive autonomy, land control, representation in army and police and the merger of the northern and eastern provinces, (c) to ensure all this within a united Sri Lanka, and (d) to secure India's own strategic interests in insulating Sri Lanka from the influences of other powers, super or regional. As diplomatic theatre, the Accord's theme was inspiring and its script was well-crafted. Rajiv Gandhi even took the final applause for granted when he hailed it as "the greatest event of the 20th century". He also assured the Tamils of India gathered in the Madras beach on August 2, 1987 that "short of Eelam all their demands had been secured". However, despite much prompting, neither of the two principal characters in the play, the SLG and the LTTE, appeared on the

stage, spoke their lines or acted their parts according to cue. The LTTE could not be disarmed; hostilities continue between them and the SLG until today. Nor was it possible for India to induce the SLG to effectively deliver to the Tamils any of their important demands. The unity and integrity of Sri Lanka continue to be threatened. To whatever degree India might have succeeded in weaning away Sri Lanka from other powers, at the end of it all, India itself has been left with little leverage – political or diplomatic – with the SLG on the ethnic problem.

On the other hand, India's incremental involvements in Sri Lanka between the Accord and the end of Rajiv Gandhi's prime ministership in late 1989 entailed enormous costs in terms of lives, financial resources, property, and India's military, political and diplomatic credibility. By September 1987, within five weeks of the Accord, the Indian army was in open war with the LTTE whom the Indian government had bribed and cajoled previously for four long years. In mid-1989 the LTTE was able to diplomatically outflank India by concluding a deal with president Premadasa and succeeded in getting the IPKF fully out of Sri Lanka by March 1990 whereafter, from a better entrenched position, they have resumed their hostilities with Colombo. Militarily, the IPKF operation was a failure with the mighty Indian army not being able to disarm the LTTE even after two years of effort. The IPKF's goals were ill-defined, its command of the terrain and logistics were poor, its morale was not sustained, its intelligence was defective and, most importantly, the local population in northern Sri Lanka rallied behind the LTTE out of solidarity or fear or in reaction to the IPKF's acts of torture, rape and pillage. Indian support right until the end for the puppet EPRLF government in the North-East Province was misconceived and resulted in a political vacuum when the IPKF finally withdrew early in 1990. Indian support for paramilitary units in Sri Lanka such as the Tamil National Army (TNA) and the Civilian Voluntary Force (CVF) and to anti-LTTE militants exacerbated the level and diffusion of arms in both countries. The Indian high commissioner blustered away in Colombo while Doordarshan bluffed at home to dupe the public into believing that all was going well with the Accord. The Indian intervention coalesced anti-Indian sentiments among all political parties in Sri Lanka and provoked the second JVP insurgency in 1987 involving

the loss of thousands of Sri Lankan lives. It also served to fuel the anti-Indian stances of Pakistan, Bangladesh and Nepal in SAARC. The human and financial costs were considerable. The IPKF lost 1,200 and 2,500 were injured. The LTTE probably lost 1,500 with 2,000 being wounded. Casualties among other militants and civilians also ran into thousands. The financial cost of the IPKF operation to India was perhaps of the order of Rs 2,000 to 3,000 crore. Much damage and destruction was visited on private and public property in northern Sri Lanka. Thus, on all counts, the Accord proved to be not just a failure but counterproductive in the extreme.

Muni's account does not substantively go into the ultimate phase between December 1989 and March 1990. During these months, the Janata Dal government under V P Singh had replaced Rajiv Gandhi who had even before the general elections committed India to withdrawing the IPKF. In fact by December 1989, the IPKF had been withdrawn from all districts in north-east Sri Lanka except Jaffna and Trincomalee. The NE provincial government under Varadaraja Perumal, prompted and propped by the IPKF and RAW, refused to step down to enable the reconstitution of the NE provincial council; if it had done so, it might have been possible to avert a political vacuum in the Tamil provinces after the deinduction of the IPKF. The EPRLF government, however, collapsed even in February 1990 and Varadaraja Perumal, along with several of his cadres, fled to India. It was feared that during, and consequent on, the vacation of Jaffna and Trincomalee there could be large-scale violence on several fronts between the LTTE on one hand and the IPKF, SLG forces, other Tamil militant groups and the paramilitary units (TNA and CVF) on the other. This in turn could have resulted in another wave of civilian and armed refugees into India. The credit for avoiding these consequences at the tail end of the deinduction process goes to the Janata Dal government and to the patient discussions with Sri Lankan Tamil groups undertaken on its behalf in Madras by M Karunanidhi, the then Tamil Nadu chief minister. This was an instance in which New Delhi showed a rare wisdom in recognising that federalism within India could help to promote national concerns and was not a threat to them. Muni chooses to be silent on this very critical and sensitive phase except for the convoluted observation (p 174) that "the Janata Dal government of V P Singh felt itself free of any responsibilities to ensure the precise relationship between the execution of the July 1987 Agreement and the continuation or withdrawal of the IPKF". Also, later, he repeats the unsubstantiated canards about

LTTE's 'happy relations' with the DMK government in Tamil Nadu forgetting that their happiest days had been with Rajiv Gandhi and M G Ramachandran.

India's involvement in Sri Lanka during 1983-90 has given rise to a variety of issues and questions with both normative and consequentialist implications. Muni's evaluations and judgments in respect of them are, in most cases, evasive, inadequate, inconsistent or aimed at justifying establishment policies. Overall, he does conclude by saying (p 181) that "The most desirable way for India to approach the question of internal conflicts in the neighbouring countries is to work politically to pre-empt them, and then deal with them if necessary. In this approach, the temptation to get militarily involved must be resisted, notwithstanding the nature of pressures and compulsions." However, his appraisals of each stage of the incremental involvement tend to justify the actions that were actually taken instead of attempting to explore choices and alternatives that could have avoided progressively deeper entanglement. To start with, in his view, India "did not have to wait for any invitation from the combatants in Sri Lanka" to initiate the mediation process in 1983; as an affected and interested party, it had the right to intervene *suo motu*. He justifies the training and arming of Sri Lankan militants by India in terms of 'leverage-based mediation' adding, in scholarly fashion, that it is a "viable subject for serious and systematic theoretical exploration". Also, "India's moves through its political, bureaucratic and intelligence agencies to multiply the numbers of the militant groups and create and exploit their mutual inter-ethnic contradictions were also aimed at enhancing and activating the leverage". For him, mediation having failed, India had to intervene in 1987 to safeguard its regional interest and status and its internal credibility in Tamil Nadu. While admitting that Rajiv Gandhi in "his inexperience overlooked the complexities of the issues and the actors involved", Muni gives him credit for "a considerable account of sincerity of purpose in his thinking". Despite various infirmities in the structure of the Indo-Sri Lanka Accord, which he himself analyses, Muni sums it up as "a sincere compromise". In his judgment, the Accord "still provides the most appropriate and viable basis for resolving the Tamil question amicably". If the Accord broke down, it was only because both the critical actors, the SLF and the LTTE, were not forthcoming "to extend the desired co-operation to India", a development that could not have been foreseen "except perhaps by someone blessed with astro-

logical foresight". All allegations on the IPKF's role in rigging the NEPC elections of November 1988 are dismissed by Muni as 'politically motivated'. Although the IPKF did not succeed in disarming the LTTE or in making them accept the Accord, he sees its role as "positive and substantial in the overall analysis". To Muni, Indian peace-keeping was "not a case of intervention" at all and was only seen as such because the political change in India (viz, from Rajiv Gandhi to the Janata Dal) 'legitimised' president Premadasa's call for the withdrawal of the IPKF. It is only on the subject of the RAW's operations that Muni chooses to call a spade a spade. He points out that RAW "lacked a political perspective on the policy; it also lacked accountability for many of its acts of omission and commission while supporting and monitoring the activities of militant groups or setting them up against each other". He refers to reports that "some of the RAW agents were also in league with foreign intelligence agencies working on behalf of the Sri Lankan government in order to subvert the Tamil movement" and to the 'deep resentment' that the IPKF itself felt for RAW for not providing it with adequate or reliable intelligence. Yet, Muni does not go into the deeper implications for foreign policy or for domestic governance in carrying out covert operations through an agency that could be neither politically nor administratively reined in.

In sum, the book is a piece of apologia rather than an exercise in serious political analysis. It uncritically takes for granted the paramount legitimacy of India's perceptions of its so-called strategic and ideological interests. All things – good or bad, expedient or foolish – in the pursuit of such interests are justified on grounds of honest intentions or in terms of historical necessity. All things that went wrong in the conduct of policy are blamed on the intransigence of the SLG and/or the LTTE with no critical assessment of India's failures to anticipate, provide for and counteract it in the context of an intervention which not having been mutually accepted in the first place by both the principal actors in Sri Lanka was vulnerable to disruption at different junctures by one or both of them. Accordingly, Muni's study is not so much an exercise in evaluation or explanation as in extenuation and explaining away. As such, this darbari contribution is likely to satisfy only Rajiv Gandhi loyalists in our political, foreign office, and military establishments and their academic clientele. For them, it has always been a case of 'the Indo-Sri Lanka Accord is dead, long live the Accord'.

Small but Not Alone

Keshabananda Das

Technological Dynamism in Industrial Districts: An Alternative Approach to Industrialisation in Developing Countries? UNCTAD-GATE, United Nations, New York and Geneva, 1994; pp xx + 346, price not stated.

FOR about a couple of decades now significant changes in the industrial organisation, especially in the industrialised west and, of course, in Japan, have drawn attention of both the policy-makers and academicians worldwide. In the face of disturbing recessionary tendencies during the period, that witnessed the large, vertically integrated units constrained to grow, the small and medium enterprises (SMEs) seem to have performed remarkably.

Allowing for equivocality in establishing the degree and extent of this performance, the SMEs have surely proven their ability to respond boldly to crises and to chart out means of survival and growth. A conspicuous aspect of the 'achieving' SMEs has been their being 'small but not alone'. The economies of spatio-sectoral clustering of units, what Alfred Marshall termed industrial districts (IDs), have arguably acted as a catalyst.

Eventually, in a dynamic setting the potential of IDs has to be understood through inter-sectoral linkages, internal production organisation and above all as a socio-cultural entity containing an ensemble of competitive and co-operative relations. What are the notable features of SMEs in IDs in the developed nations? Do they have any policy implications, especially technology related, for the developing nations? Keeping this in view, the UNCTAD-GATE symposium Geneva, November 16-17, 1992 deliberated on 'The role of industrial districts in the application, adaptation and diffusion of technology'. The papers, proceedings and synthesis of the symposium form the book under review.

Outlining the conceptual basis of IDs, a confluence of views has been presented that range from Meinc Pieter Van Dijk's search for an 'ideal type' to individual instances, mostly in the Italian context (Ash Amin, Marco Bellandi, Bjorn Asheim and Zeljka Kozul-Wright). The micro-level evidence does differ substantially in its specific operational and organisational mechanisms manifesting differing socio-political and administrative environs within which IDs function. This, to a large extent, sets the parameters of performance. Elsewhere, cases from the industrialised west point to similar patterns in the manifestation of IDs [e.g. Pyke and Sengenberger 1992].

For one thing, a strict definition of IDs, though desirable, on the lines of a typical

Marshallian or the later stylised version of Mark II districts, has remained elusive and often not so useful in the contemporary complex systems of industrialisation. The distinctive features of IDs within/between developed nations point to the tedious and frustrating search for an equivalent 'model' in the developing countries at various stages of industrial achievement. The authors and discussants of the symposium have recognised this very well.

What, however, has been examined are the special features of IDs. The crucial aspect focused concerns what Asheim calls 'endogenous technological capacity-building'. As exemplified through a variety of cases (Part II) the scope for a synergic outcome of innovative activities has been seen to be vast. Inter-firm co-operation can serve as a solid base upon which technological upgradation could be possible. The degree of innovativeness would depend, of course, upon internal resources and level of competence. The enhanced functional integration of SMEs in IDs into the global capital network in the context of structural reforms has led to external control by MNCs or large units, adversely affecting the benefits of 'embeddedness' accruing through territorial integration.

While such a trend at the macro level causes concern, as Fernando Villaran suggests, conscious promotion of innovative activities in SMEs remains the real challenge for policy-makers. Improving clusters through provision of real services and institutions fostering technology transfer can be worthwhile intervention in this direction. The linkages between 'national' R and D 'regional' SMEs, Kozul-Wright demonstrates, are essential for high innovative performance of the latter.

An excellent synthesis of discussions (Part IV), detailed and thoughtful, by Brigitte Spath places the issues and policy implications in order. This is useful as it reflects the view of a range of scholars and policy-makers, who had not contributed papers but actively participated in the deliberations. Highlighting the critically of flexible, dynamic and supportive interventions/institutions in upgrading IDs she underscores the imminence of both empirical and theoretical research "adapted to the specific conditions of developing countries". This is an important lesson the symposium brought forth.

The moot question, however, is whether the European experiences have been studied with adequate analytical rigour so as to establish a direct/causal link between the role of formal institutions and innovative activities in the IDs. Again, institutions at different levels – local, national and global – can have varying impacts or no impact at all. Whereas most research 'details' the processes at the micro level little is known about its broader implications, especially towards promotion of technological dynamism. A recent comprehensive review of European IDs by Schmitz and Musyck (1994) clearly points this out. According to them, "There is little systematic assessment of the role of governmental or non-governmental institutions in the European industrial districts. In some cases it is hard to tell whether this is so because such institutions were unimportant or because they remained under-researched" (p 904).

This leads to the subsequent question of replicability. Even in the European context one may draw 'wrong conclusions' by universalising Italian or Japanese experiences. Kristensen's (1994) reflections on the responses of the Danish local 'spectator communities' in organising production in SMEs, operating in an open volatile global economy, elaborates this effectively.

Whether and how useful are these lessons from developed nations to the developing ones? Providing a critical backdrop to this issue, Khalid Nadvi has surveyed the experiences of IDs in developing countries. His analysis of the available studies, scanty and scattered, presents the diverse and complex systems of production organisation and points to the tremendous possibilities of collective efficiency of clusters. Even here, there exists a dearth of studies focusing primarily on the whole gamut of issues on the 'actual mechanisms' involved in technology transfer, upgradation, product and process innovation and adoption in IDs of developing countries. This acts as a barrier to 'import' the European model, if there is one, to the developing countries. The evolution of technological dynamism depends so much upon the nature and degree of inter-firm relationship and also the character and function of the 'social milieu', given the 'incipient' industrialisation of the developing countries. In fact, the strong role of state intervention and supportive sectoral institutions remains a crucial aspect of technologically activating the IDs. Both the case studies presented, one on the Okhla ID in Delhi and the other on the sophisticated Singapore Technology Corridor, are deficient in insights: the former has a very limited base of enquiry and the latter is certainly not

a 'representative' case of developing nations. One wonders if this reflects a generally casual approach in studying the micro-level dynamics, especially in the developing countries.

Further, the overwhelming presence of surplus labour in these economies "can act as a powerful disincentive to process innovation and, along with being synonymous with poor working conditions, is likely to dampen technological process" (p 229). The evidence at hand presents a mixed picture making it imperative to study as many diverse cases, both regionally and sectorally, as possible. Policy implications can then be understood better.

Silent Cry

Rinki Bhattacharya

Marital Violence in Canada by Lise Lachance; Research Centre for Women's Studies, SNDT University, Bombay, 1994; pp 94, Rs 40.

RECENTLY, the Research Centre for Women's Studies of SNDT university released the first title of a series under the general caption, 'Women of the World Series'. The inaugural title, *Marital Violence in Canada* by a visiting journalist from Montreal, Lise Lachance, is of particular significance for several sound reasons. The title however coincides with the UN declaration of 1994 as the International Year of the Family (IYF). Lachance's detailed and systematic evaluations of the abuse of power in a patriarchal family structure, its inherent violence, quickly demolishes our fond notions of the idealised 'family'. She establishes the invisibility of domestic violence by the classic 'closed door' and 'silent cry' imageries victims of and workers against violence are familiar with.

Oral histories and excellent samples from Canada's judicial annals in cases of marital violence support Lachance's report, while her crisp journalistic style make it eminently readable.

Lachance confronts readers with some alarming statistics:

A quarter of all Canadian women have experienced violence at the hands of a current or past marital partner. This number which includes common-law unions exploded on the public scene on November 18, 1993 when the government launched the report of a survey conducted on 12,300 women of 18 years and above by Statistics Canada on behalf of the Ministry of Health.

Inadequate statistics and research in India on marital violence is forcefully brought

A sure contributor to the debate on SMEs/IDs, this book is timely and thought-provoking.

home by informed pieces of evidence as this.

One of the main strengths of the report is its successful demolition of the belief that marital violence is only physical brutality. Lachance tells her readers.

Among all the abuses imposed on women, sexual violence is the one victims find most difficult to admit, perhaps because it shakes the very foundations of men/women relations in a society where sexuality - even if taboo - defines the essence of male-female conditioning

Lachance talks about the victims' 'isolation', a known form of mental cruelty, by the deliberate withholding of 'emotional supports' or how "some men resort to emotional and psychological tactics to ensure that a woman cuts ties with her nuclear and extended families", concluding, "a woman who has been battered by her partner may have been raped by him, maligned, psychologically scared and financially deprived." The writer reminds us, "In each case the aim is the same; destroy in order to control."

The author affirms the absolute vulnerability of victims. It is curious too the report should confirm that "most violent men are great consumers of pornography." Feminists had always insisted, in fact, established the nexus between pornography and violence. That pornography reinforces violence against women. Lachance now reaffirms the same in an intimate relationship.

Reviewing Lachance's report without frequently quoting her is nearly impossible. Each line of her report is dense with

meaning, furthering our quest for understanding a form of violence that is different precisely because it does not "appear suddenly between strangers but always in the frame of a privileged relation... at one end of the scale is intimidation, at the other end even death."

In less than 100 pages (exactly 94) Lachance has provided us not merely an overview of marital violence, but a perspective. Better still, a comprehensive approach - urgently required - to understand a complex, misunderstood, and underscored crime, enjoying social sanction in many cultures. Lachance recalls,

... male violence is accepted in our society, in all but its most extreme forms. Therefore any attempt to stop wife battery must address those social values which support violence

A most valuable, indeed, inspiring, part of the report is Chapter 4, titled 'Justice'. This section deals with landmark judgments, from recent court cases in Quebec. There is a welcome change in the judicial perception of marital violence, recorded through quotes. Lawyer Sylvia Schirm, whose practice consists of assaulted women, states, "As long as marital violence will not be treated in the same drastic way as drunken driving, it will not come down." She believes women judges would bring greater sensitivity to cases of wife abuse. Another senior judge observes, "marital murder is a second-class crime".

The 1990 Canada Supreme Court judgment by justice Wilson acquitting a battered woman who shot her common-law husband one night, when she feared her death, was unique for its compassion to victims of marital violence. Justice Wilson went on record, asserting, that the 'learned helplessness' of victims and the cyclical nature of their abuse was tantamount to "their murder by instalment". Wilson reiterated, "far from protecting women the law historically sanctioned the abuse of women within marriage as an aspect of husband's ownership of his wife and his 'right' to chastise her".

Wilson displayed a rare understanding of the issue, stating bluntly: "It was not for the jury to pass judgment why an accused battered woman stayed in the relationship". Undoubtedly, these judgments opens a more egalitarian way for men and women.

Lachance reserves the inevitable question, 'How can we help a battered woman?' for her finale. The answer is 'believe her' urges Lachance.

Direct, spontaneous, even impassioned, Lachance's report, quite simply, is invaluable to workers against marital violence. And to the victims.

Financial Sector and Economic Reforms in India

Arjun Sengupta

Of all markets, the market for financial services is most prone to imperfection and, therefore, to failure and that failure occurs because the price of financial services more often than not fails to clear that market. In regard to reform of the financial sector, therefore, we must admit that we do not have answers to all the questions, that we have to move step-by-step, looking at the objective conditions which normally are widely different from the ideal and take decisions to reach our goals through trial and error in a practical world

THERE is so much trash that is written about economic reforms in India and there is so much slogan mongering that one is quickly driven to taking positions on many issues without considering all the aspects so that one is not identified with categories as pro-reform or anti-reform. A man from the world of finance cannot afford to do that. He must admit that theoretical and professional literatures do not provide an unequivocal answer to all the questions. Only politicians and theologians are cocksure about their positions. A practitioner of prudent behaviour, dealing with other peoples' trust, must admit that we do not have answers to all the questions, that we have to move step-by-step, cautiously, looking at the objective conditions which normally are widely different from the ideal and take decisions to reach our goals through trial and error in a practical world.

Let me give a few examples of the limitations of the real world in the context of economic reforms. First, it is obvious that a policy of free entry in any economic sector cannot be successful if it is not matched with a policy of free exit. If a production unit finds that it cannot be viable in the given conditions of the market or, in an even weaker sense, it is not going to make in any existing line of business as much profit as it would make in an alternative activity, it should be able to wind up its business at a reasonable cost. In the real world, it can very seldom be done quickly and flexibly. Even in many industrial countries, exiting from a business involves so much liability-settlements and litigation possibilities that the cost of exit can become quite large, and more importantly, quite uncertain. In a country like India, the exit possibilities become even more remote because of our extremely difficult labour/redundancy legislations. There is little chance that these conditions will change drastically in the near future, and all that we can hope for is that conditions would be created through the provisions of generous compensations, re-training facilities and other insurance benefits, so that eventually non-viable units

manage to close down. If a policy does not take into account the possible cost of such exit and a relatively slow pace of its materialisation, it cannot be considered realistic.

Similarly, if there is over-staffing in any production unit, in the sense that with a reorganisation of the staffing pattern the unit can produce the same level of output with a lower number of people employed, the unit must be able to shed those staff in order to play the competitive game with efficiency. The units do not have to close down but only rationalise its labour force in order to be competitive in this situation. Again, all that we can hope for in the near future is that if the units are prepared to incur a substantial cost of compensation or re-training it can negotiate a settlement with the trade unions for rationalising its labour force. Otherwise, it has to wait indefinitely for the natural course of attrition to do that justice. If a bank with a large surplus labour tries to adopt policies on the assumption that the surplus can be retrenched in a short time with little cost, it is going to come a cropper without much loss of time.

Similarly in case of privatisation, however much it may be desirable for our production units or commercial banks to be privatised and even if there is no technical reason why such privatisation cannot be completed, it does not seem possible to do so on a large scale in India in the near future. We can disinvest the shares of these units and if such disinvestment process is preceded by an appropriate restructuring of the assets and liabilities of the units, the revenues of such disinvestment may turn out to be sufficiently attractive. It could then encourage the process of disinvestment, but still the decisions to go below 50 per cent of public share may take quite a long time to come. It is of course possible to be critical of this situation and condemn the government for its lack of commitment to economic reforms, because obstacles to privatisation in most cases are political without any economic or technical justification. But governments are political entities and policy-makers must take into

account the political compulsions to assess the feasibility of a policy and work towards the ultimate desirable goal.

REAL LIFE CONSTRAINTS

There are many such instances of the real life constraints on the operation of economic reforms, but I have chosen these specific examples to highlight a point, namely, if these limitations are accepted then the emphasis of policy in the near future has to be somewhat different, at least for some time in the near future. Instead of wishing away the existence of public sector units, whether they are banks or firms, we have to think of how to improve their operations, how to increase their autonomy and how to make them better their performance even when there is public ownership. For units with surplus manpower the emphasis would be how to organise the operations of the unit, disengaging this surplus labour force efficiently, until they can be shed or retrenched effectively. Similarly, corporatisation of the units and restructuring their assets to maximise the returns from eventual divestment should get a priority over the outright sale of the units. For loss-making units, however, which cannot be made viable or whose viability would involve too high a cost, the policy should be to effect a closure immediately without allowing the operations to linger on indefinitely.

Another such real life constraint is the inability of the government to reduce public expenditures below a particular level. Reduction of deficits is a *sine qua non* of reforms. But if that has to be done without raising the tax rates, public expenditures have to be brought down. However much we may wish to cut defence expenditure, or costs of administration, involving wages and numbers of government servants as well as all kinds of subsidies on food, fertiliser, kerosene, etc., there may be an effective limit below which the government may not be able to go. Deficit reduction would then imply either a reduction of public investment or an increase in tax

revenues. If tax-compliance and tax-coverage cannot be improved through proper enforcement and administration, tax rates will have to be raised to increase tax-revenue. If a reduction in the tax rates, across the board, is also made an essential element of economic reforms, the only option left would be to reduce public investment. But if public investment is a crucial determinant of both private investment and the rate of growth of our economy – a proposition for which there is a large empirical evidence – a fall in public investment may actually lead to an increase in the deficit as a proportion of GDP even with the same absolute amount of total fiscal deficit. Clearly, the empirical situation points to a number of trade-offs between different policies, between deficit reduction, tax rates reduction and increase in public investment. The answers have to be based on the realities of the situation and not on some pre-conceived biases for and against some policies. If it is a fact that reduction in public investment over the years would reduce the overall rate of investment in India and thereby reduces the rate of growth, it would be necessary, for the sake of a successful implementation of economic reforms to provide for an increase in public investment, even if that means no further reduction of tax rates, and a vigorous enforcement of tax-compliance. Some of us feel on the basis of several empirical studies that when we have come down from the earlier 90 per cent tax regime to 40-45 per cent tax rates, a marginal increase in tax rates, and an expansion of tax coverage would not significantly affect output and employment. If the latter is completely unattainable, it may be necessary to raise the fiscal deficit on the margin, especially if that is the only way to protect public investment. I must hasten to add that I am the last person to support an increase in the fiscal deficit and in any case, that should be the last resort. What I am trying to emphasise here is that we must use all the policy variables, flexibly, to achieve our objectives depending upon the trade-offs given by the empirical relationships.

ESSENTIAL ELEMENTS OF REFORMS

At this stage, I think I must define what I meant by the essential elements of our economic reforms. The measures that we adopted in 1991 were not terribly novel and unheard of. They have been practised in many countries of the world which have adopted the Fund-Bank programmes in the past. Many of these measures were adopted in 1981 when we went to the IMF for an EFF programme. Several economists had argued for the adoption of such a programme, with or without the Fund-Bank assistance, for quite some time in the past and at least since 1987 when the short-term debt of our

country started rising at an increasing rate. What is novel about the economic reforms of 1991 is the timing and the fact that it was introduced as a package of measures to meet a specific liquidity crisis for which such an elaborate package was really not necessary. These measures were meant to correct 'systemic distortions' and it was extremely courageous of the government to adopt that package at that time.

There are three essential elements of this package of reforms. First, deregulation and liberalisation of all markets; second, increasing competitiveness in all spheres of economic activities; and third, living within our means or a strong budget constraint on all economic agents.

The third element is self-evident because one cannot live beyond one's means of current and borrowed income. If expenditure exceeds income, current plus borrowed, prices will increase to make them equal. However, there is a degree of freedom in one's ability to borrow and this is where the financial institutions have a role to play – commercial banks in the case of individuals and the central banks in the case of governments. They have to ensure that current borrowing matches with the future streams of income without which an essential plank of economic reforms based on pricestability will collapse. Indeed the maintenance of this budget constraint or the fiscal discipline may be regarded as an essential pre-condition for a successful implementation of other elements of economic reforms, as without that the economy would be exposed to expectations of rising inflation, which could distort all the price – and income – signals for appropriate allocation of resources by the market. There may not be anything sacrosanct about a particular figure of the rate of inflation such as that it should be less than two-digits or so. What is important is inflationary expectation which depends upon fiscal discipline or a visible tightness of the budget constraint.

There is now very little disagreement about the desirability of deregulation and allowing the market forces to have full play. The Indian economy has always been a market economy with an overwhelming bulk of all transactions being settled in the market place. What we have learned from our experience is that the only way to influence the market would be to play with the market forces, with price and income-related instruments, because any attempt to control or regulate those market variables would normally create parallel markets and generate pockets of scarcities and rents, frustrating the implementation of those policies. The days of licence and control are over and if there are still some vestiges left, they will have to be given up as soon as possible.

This, however, does not mean that markets do not need guidance or 'free market' can be the answer to all our problems. Even in theory, competitive markets could ensure what is known as Pareto-efficient resource allocations, leading to the maximum potential output, only under stringent assumptions. There are many cases when the markets fail, the most pervasive case being incompleteness of the markets or imperfection of information, which make practically all actual market situations failing to meet the Pareto-efficiency conditions. If national objectives are not confined to only maximising output but also changes in the distribution of incomes, either inter-personal or inter-regional, market failures become almost endemic, because non-distortionary redistributive measures are rarely available. The second best theorems go even further, suggesting that when there are several distortions, removing one of them and moving the economy closer to free market solutions may not be welfare improving. I must hasten to add that presence of market failures does not justify widespread government intervention. All they mean is that markets left to themselves need not be Pareto-efficient and there may exist some form of government intervention, respecting the practical limitations on markets which could raise welfare. In other words, when one recommends a government intervention one must be able to demonstrate that it is less expensive and less distortionary than the operation of market forces. Clearly, government interventions would have to be highly selective.

I have gone into these details of exposition only to strike an appropriate note of caution, that we must not be swayed by theologians either on the side of free markets or on the side of government intervention. The real world is very much complicated and pros and cons of every measure have to be weighed in practical terms before its adoption.

MARKET FOR FINANCIAL SERVICES

Of all markets, the market of financial services is most prone to imperfection and, therefore, to failure and that failure occurs because the price of financial services more often than not fails to clear that market. The basic difference between financial markets and other markets is clearly brought out by the following passage:

In capital markets, money today is exchanged for a promise of returns in the future. The promise is always, in effect, a contingent promise: in the case of a bond the promise takes the form, 'I will pay a certain amount provided that I can; and if I can't, certain other consequences follow'. In the case of equity, the promise takes the form, 'I will pay a fraction of my profits. I will decide the fraction, and I will decide how profits are defined. Trust me! If I don't pay you a dividend, I will reinvest the money in the

firm, and you will receive a return in the form of a capital gain'. It is precisely this difference which explains why financial markets are not, and cannot be, run as auction markets; why lenders, for instance, do not simply lend to those who are willing to offer to pay the highest interest rates. Those who promise to pay the highest interest rates may not, in fact, be those for whom the expected return is highest... Prices (interest rates) play a role in the allocative mechanism – they define, for instance, the opportunity cost of funds; but the allocative mechanism is fundamentally a *screening* mechanism, in which prices play a secondary role (Bruce Greenwald and Joseph Stiglitz, 'Information, Finance and Markets: the Architecture of Allocative Mechanisms', working paper No 3652, National Bureau of Economic Research, Cambridge, Mass.)

Let me confine myself to the market for loanable funds where the banks perform, besides the usual agglomeration function (pooling together limited savings of single individuals) and the transfer function (transferring resources from savers to investors), also the selection function (selection among alternative use of funds and the control function (to encourage prudent behaviour of those who have been provided funds). Both these last functions are susceptible to failures. The control function, which involves by now the famous principal-agent problem, is crucial because efforts of the borrower affect the return on the loan, and without perfect and costless information the banks cannot stipulate all the actions which the borrower should undertake, nor could they formulate the terms of the loan contract in such a manner that the borrower is induced to take the right actions to make the outcomes of the loan a success. Banks, therefore, may not be expected to make loans of the same size and same repayment schedule to be offered to two different borrowers at the same interest rate, if the reputation for prudence of one borrower is worse than that of the other. The selection function is even more difficult to perform, because by varying the price of the loans (interest rates) the banks may not be able to get the best allocation of loanable funds. The individuals who are willing to pay higher interest rates may on an average beat worse risks, willing to undertake projects with lower probability of success but higher profits when successful.

In a classic paper published in 1981, Joseph Stiglitz and Andrew Weiss ('Credit Rationing in Markets with Imperfect Information': *American Economic Review*, June 1981) showed that a loan market in a situation of imperfect information may be characterised by credit rationing, where the interest rate could be in equilibrium (in the sense that bankers would not have any incentive to change the rate once it is reached) but where there could still be an

excess demand (in the sense that among loan applicants who appear to be identical, some receive a loan and others do not, and the rejected applicants would not receive a loan even if they offer to pay a higher interest rate). The conditions under which such credit rationing emerges appear to be quite general and, therefore, applicable fairly universally. They can be summarised simply as follows: as the real interest rate charged to any one class of borrowers increases the probability of default on loan contracts also increases. As a result the expected return by the bank increases less rapidly than the interest rate and beyond a point would actually decrease. This is mainly because of two reasons: first, 'the adverse risk selection effect' under which, as the interest rate increases a higher proportion of riskier borrowers come forward for the loan; and, second, the 'incentive effect' under which any one borrower will tend to change the nature of his own project from a safer to a riskier one, because he can take away the extraordinary profits if the project succeeds, but walk away, maybe with some cost, with default if it fails, especially because the bank cannot perfectly monitor his actions.

Ronald McKinnon (*The Order of Economic Liberalisation, Financial Control in the Transition to a Market Economy*, John Hopkins University Press, 1991) has developed the Stiglitz-Weiss model and presented it in terms of a chart which is reproduced here. The real interest rates on bank loans is different from the real expected return on such loans (taking into account the probability of default). Suppose the loan applicants can be divided into different risk classes, and the number of applicants in each class is sufficiently large with a defined distribution. The figure shows three distinct risk classes, R_1 , R_2 and R_3 in ascending order of expected returns and variance in their return. Class R_1 is perfectly safe with no variance in outcome and with the maximum interest rate that the borrower can pay being r_1 which is also the expected rate of return. The graph R_2 covers riskier projects with a higher expected yield but it lies below and to the right of the 45-degree ray because of the incentive effect and adverse risks selection and expected return to the bank increases more slowly than the loan rate. The maximum expected return occurs when the loan rate is set at r_1 after which the influence of adverse risks selection on bank profits more than offsets increases in the rates of interest. The borrowers in class R_3 would be offering investment opportunities with higher potential returns but also with higher potential default. Because the real expected return of R_3 projects would be lower than that of R_2 projects, the banks lending would be restricted to the R_2 category (with interest rate at r_1) and all borrowers

in R_3 category will be rationed out, even though they have more productive projects, although with larger variance in their internal returns. The point to note here is that the interest rate r_1 at which credit is rationed out is also the equilibrium rate, because if the cost of the loanable funds to the bank is independent of the nature of the projects they finance, the banks profits also maximise at the interest rate r_1 . The other classes of loans will be ignored unless the total of loan applications at r_1 falls short of the supply of loanable funds.

The lower panel of the figure brings out this excess demand situation more clearly. L_D is the usual demand curve, for loans as a function of the real rate of interest ' r '. To derive the supply curve of loans, we have assumed that bankers freely compete for depositors and the interest rates received by depositors would depend upon the expected return per rupee of loans, as derived from the real interest rates according to the relationship described in the upper panel. Under the usual zero-profit competitive equilibrium, the deposit rates would be equal to the expected returns for any particular interest rate. Accordingly, there is a maximum deposit rate that banks would offer after which deposit rates will fall with the rise in the lending rate, and the supply curve of loans will take the shape of L_s as given in the lower panel. The equilibrium interest rate is r_m , at which there is an excess demand. There is a market clearing interest rate, r_c , at which the demand and the supply of loans are equal, but that is not the equilibrium interest rate, where the banks' profits are maximised.

ADVERSE RISKS SELECTION

Within the assumptions of the Stiglitz-Weiss model where the macro-economic conditions are stable and the distribution of returns in the projects of borrowers is statistically independent of one another, the banks who are following prudent policies would on their own practise a ceiling on their interest rate, without being dictated by any regulatory authority. However, if there are conditions of macro-economic instability with inherent inflationary pressures and real exchange rate instability, the expected return on bank loan, taking into account the probabilities of default, may fall much below the actual real rate of interest especially if there is a positive co-variance among the expected returns to project within any one risk class. Without the regulatory authority trying to restrain the interest rates, the banks may try to take undue risks. The incentive to make high-interest, and therefore, high-risk loans can be very tempting, because a favourable outcome may lead to very high profits, while they can walk away when there are heavy losses. The banks

FIGURE: BANK PROFIT MAXIMISATION WITH ADVERSE RISK SELECTION AND STATISTICALLY INDEPENDENT DEFAULT PROBABILITIES (THREE CLASSES OF NONBANK BORROWERS)

would tend to ignore the fact that under macro-economic instability the default rates among the borrowers are not uncorrelated, especially if the banks concentrate their lending to a few large borrowers who are willing to pay high interest. This tendency would get compounded if there is a deposit insurance cover when there is a real moral hazard. The expected profits from risky lending could be very high in the case of

favourable outcome when the banks would try to keep extraordinary profits, without having to pay the full cost of the probability of unusually large losses, which can be passed on partially or fully to insurance agencies. The problem of moral hazard is multiplied when the banks are not privately owned and do not face at least the risk of bankruptcy or loss of their ownership claims in the event of unfavourable outcomes. With or without

a full deposit insurance cover, nationalised banks may behave as if they want to incur risk and not as risk averse, appropriately regulated, prudent banks.

Ronald McKinnon refers to the Chilean experience from 1976 to 1982, when uncontrolled interest rates coupled with implicit deposit insurance of the banks led to adverse risks selection among the borrowers and severe moral hazards in the banks themselves. Even though the macro-economic conditions were unstable subject to large changes in the rate of inflation and the real exchange rates, Chile had removed interest rate ceilings on deposits and loans in a mistaken form of financial liberalisation and their financial system almost collapsed. Like Chile, Argentina and Uruguay had also made similar efforts to deregulate and privatise their banks without sufficient fiscal and monetary controls in place. Interest rates on both deposits and loans were completely freed, leading to unexpectedly high lending rates, enterprise bankruptcies and bank failures, to prevent which the governments had to re-introduce regulations. McKinnon observes that "even in the highly developed capital markets of the US, the federal deposit insurance is creating severe problems for bank supervisors in curbing undue risks taken by commercial banks as well as savings and loans institutions". This problem can be much more severe in a developing country which does not still have a very well developed equities market, where the standards of accounting and supervision are still in their infancy, where the macro-economic stability has not yet formally entrenched its roots, where nationalised commercial banks, with or without deposit insurance are the principal lenders in the market and where more often than not there is a concentration of loans to a few borrowers.

A situation like this is particularly relevant for the present stage of economic reforms in India. As I have said earlier, there is very little disagreement here about the principles of our economic reforms, or about the logic of the different measures. The debate is basically about the design of the reforms-package and the sequencing of the measures, keeping in mind both the desirability and the practical feasibility of the different measures. I do not think anybody today would be arguing against liberalisation of the financial sector or deregulation of the banking system. I have noticed an almost universal consensus about the major tenets of the Narasimham Committee recommendations. But the questions still remain about how to package these measures and sequence them, especially since we have a large number of banks with substantial non-performing assets, quite a few of them making huge losses and a number of them having surplus manpower with inadequate discipline

and back-dated technology.

I do not think there is much disagreement even about the need for privatisation. Some of us may still believe that bank nationalisation of 1969 was a historic necessity. But that does not mean that the banks have to remain under public sector even today. If the regulatory system is properly worked out and if the Reserve Bank is allowed to enjoy the autonomy that central banks should, public ownership is no longer necessary to guide the financial market, to achieve the objectives of financial growth and balanced development. But then a hard-headed analysis of our problem must also recognise that privatisation of the banks is not going to solve all our problems or that privatisation, or divestment of ownership of the public sector banks can be achieved overnight. In the meantime, the banks have to be restructured and restored to health so that the values of their assets increase and the revenues that can be realised through their divestment can expand.

The policy for opening up the banking sector, allowing free entry, subject to the regulatory norms, would be an essential element of improving competition in this area. There should be a significant increase in competition, in providing banking services, both in terms of quality and quantity. All elements that work against such unleashing of competition must be withdrawn, and all facilities must be provided for improving the productivity of the banks and the technology of their operations, so that they can build up their competitive strength.

DEREGULATION OF INTEREST RATES

Let me not dwell on these issues very much about which I think there is not much controversy. Let me come back straight to the issue of deregulation of interest rates. There also I do not think there is much disagreement about the need for simplification, the removal of highly complicated and varied structure of interest rates. The Reserve Bank has rightly moved in the direction of reducing the number of interest rates, which can be regarded as relevant. I would also agree that eventually all the concessional interest rates should be withdrawn. I am not yet convinced that the system of directed credit should yet be completely dismantled. If the logic of the credit rationing argument that I have given above is accepted, there may still be some valid reason for continuing with a limited amount of directed credit, especially for certain sectors which have large social benefit and which are in their infancy in their stage of development. But it would be difficult to support the provision of such directed credit on concessional terms. After all, the interest rates reflect the opportunity cost of capital and the banks should be able to select projects, even in the so-called priority sectors, in the

light of that opportunity cost. In any case, since money is fungible, and kerb markets exist, concessional rate to one sector could easily degenerate into provision of rents to some selected interest groups, without even doing the screening function, if not the allocating function proper, that the interest rate is supposed to perform.

There can hardly be any disagreement with the Reserve Bank about its policy of the reduction of SLR. If the securities that banks hold as a part of SLR increasingly earn market-related interest, stipulating a precise figure for SLR would soon become redundant. There can be some disagreement about the CRRs. A minimum fraction of CRRs may have to be retained for transaction purposes and even that should probably get some remuneration, no matter how valuable the service that RBI's regulatory activities provide to the banking system – an argument which has been used to justify non-payment of remuneration on these reserves. But if CRRs are used to impound a part of the liquidity of the banks and thereby restraining the expansion of credit, I am afraid there may not be much case in their favour. A proper open market operation would be a much more effective way of doing the same job and it is always better to use the instrument that is transparently aimed at a specific objective, rather than transmitting a confusing signal to the system.

The trouble with open market operations is that they tend to increase the interest rates, especially on government securities and Treasury Bills. It is good that the earlier limitations on such interest rates have been withdrawn. But we must also recognise the implication of such policies for the deficit management of the government. With the mounting interest burden on government expenditures, we are introducing a substantial element of inertial deficit in our system, which can soon become quite explosive as happened in many Latin American countries. Indeed, if a fiscal deficit cannot be eliminated, the argument that most of it should be financed by borrowing and not by money creation, is not quite self-evident. A decision has been taken recently by which RBI financing of budget deficit is expected to come to zero very soon. Taken in isolation, and in a system with a huge liquidity overhang, this is a laudable objective. But if the fiscal deficit cannot be reduced significantly and if there is already a large interest burden that the government has to bear, a case can be made that some amount of inflationary tax which is associated with the RBI's financing of the deficit may still be desirable, provided the growth of money supply does not go out of hand.

The primary objective of policy, however, must be the control of fiscal deficit and to my mind, that is the essential prerequisite for any success of our economic

reforms. I started by saying that living within our means is the essential plank of our economic reforms and by that I mean our means, not of only today but also of tomorrow, on the basis of borrowing which we can do prudently, and prudence in borrowing depends on how the funds are spent. In other words we need not make a fetish of any particular number as a maximum fiscal deficit. If a fiscal deficit is essential to support a public investment programme either in infrastructure or in a major sector that can be executed efficiently and increase our productive capacity and potential income, it may have to be justified, if the alternative is to go without such public investment programmes. But the most important condition is, as I have noted earlier, the demonstrable adherence to fiscal discipline so that there is no expectation about rising inflation, which can disrupt macro-economic stability. Of paramount importance here is the elimination of revenue deficit both at the centre and the states and a demonstration that every effort is made to restrain overall demand pressures on the system.

In that context, there is no room for any relaxed monetary policy and I am afraid no case for an immediate deregulation of interest. By non-relaxation of monetary policy, I would mean giving out signals that we would not only keep a control over money supply but also at least for some time over the interest rate. We have now a temporary situation created by the unintended increase in our foreign exchange reserves. I call it temporary because most of the increase in our reserves is due to the fact that our imports have not grown to the extent necessary to absorb this extra inflow of foreign capital. That again is largely a result of inadequate growth in our economy. Both these situations cannot last for long and we should not be unnecessarily worried about the accumulation of these reserves. However, so long as these reserves are increasing they should not be mistaken as increase in the supply of loanable funds, allowing for a possible lowering of the interest rates. The loanable funds can increase only if savings increase or extra resources are provided by the foreign sector through import surplus. When that is not taking place, the extra liquidity must be mopped up by the central bank and I see no alternative but to sterilise these reserve inflows. I have some sympathy with the proposal made in the RBI's *Annual Report* about a small tax on these inflows, although I would like to avoid it, lest it gives a wrong signal to the international community. A better method may be extending the period of short-term capital gains tax, from one to three years, which may be a damper on those investors who are after purely short-term capital gains and not motivated by the long-term potential of our economy. But with or without these measures for dampening the

inflow of these reserves, there is every reason why they should be sterilised if their accumulation is unintended. There would of course be an upward pressure on the interest rates, with their implications for the problem of debt management of the public sector. But that is a price we have to pay for keeping a control over monetary demand. I am not persuaded by the argument that if the interest rates increase, that itself will further attract foreign inflows. The FII investments which are the main factors behind this increased foreign exchange inflows are not so much guided by the current interest rates as they are by the growth potential of the economy and the prospects of capital gains, that basically depend upon the expectation about future fall of interest rates. In other words, the FII investment should continue to flow in so long as the perceptions of our growth potential persist, and our policies should be guided by considerations about the control of aggregate demand, to keep a check on inflation and thereby sustain our growth potential.

If the logic of my presentation is accepted and the description about the credit market characteristics in terms of credit rationing appears realistic, I would submit that we should follow an interest rate policy which has only two elements, a ceiling on the lending rate of interest and a floor on the deposit rate of interest. Subject to that the banks should be allowed to compete with one another in their operations in the financial market. The current policy of a ceiling on the deposit rates and the deregulation of interest rates on loans above Rs 2 lakh has a danger that it would encourage, in terms of the analysis given above, adverse selection and the weaker banks, which already have large over-hang of non-performing assets, would move towards providing credit at higher interest rates, involving higher risks of default. The stronger banks would be competing among themselves for prime borrowers, which may lead initially to a fall in the interest rate. But as the liquidity over-hang is removed, either through sterilisation or through competition with the private placement of commercial paper, there would be increased competition for deposits and a gradual increase in the rates of interest. If my diagnosis is right and if the fundamental characteristics of the Indian financial markets is that of excess demand, I am afraid we shall soon go back to the situation of upward pressure on interest rates if we do not still have a full grip over the macro-economic fundamentals, and until inflationary expectation is squeezed out of the system, we cannot afford to relax on monetary policy. If we do not succeed in imposing a strong fiscal discipline, but still deregulate interest rates, I am afraid our primary problem will be adverse risk selection and the moral hazards associated with them, when most of our banks are still publicly

owned, without having to pay the full social costs of risky lending. Let us not make the mistake that the southern Cone countries made in the early 80s. Let us be cautious and not be overtaken by a zeal for so-called 'liberalisation', without thinking through all

its implications. The greatest threat to liberalisation comes from half-baked and ill-conceived designs of liberalisation.

Structural Adjustment and Small Producers

Reflections from Case Studies

Sarthi Acharya
Niru Acharya

The small-scale sector which accounts for a substantial quantity of goods and provides employment has been uniformly affected by the new economic policies on one count or the other. The present policies are also oblivious to the problems of small farmers and other primary sector producers, especially in the semi-arid regions. This article attempts to assess the impact of new economic policies through a set of case studies of units in the small sector.

INDIA embarked upon a policy of economic liberalisation since the mid-80s. However, considerable fiscal indiscipline on the one hand, and exports not keeping pace with imports on the other, resulted in an economic crisis in the early 90s. Borrowings from the International Monetary Fund (IMF) had to be resorted to, and a structural adjustment programme (SAP) and economic liberalisation were set in motion soon after. Entry of multinational corporations (MNCs), decontrol over markets, and steps to integrate the economy into the world system, were some of the measures undertaken.

At this juncture it is important to understand some basic parameters of the Indian economy. Agriculture, to a great extent, is in the small farm sector (over 75 per cent of the farm holdings are small), and it employs about 65 per cent of the total workforce. In the industry sector, large factories contribute about 63 per cent of the industrial output and employ about 28 per cent of the industrial labour force. The unorganised sector (mainly small industries, handlooms, etc.), accounts for the rest. While the output composition of the services sector, by size, is not readily available, its employment composition by organised/unorganised sectors, is much the same as in the industrial sector [CMIE 1993]. These statistics (for early 1990s) show that over 60 per cent output and about 90 per cent workforce is outside the organised/large-scale sectors. It also needs mention that the 'model' of development till recently, advocated investment in machines rather than humans; as a result, about half the population is illiterate.

The structural adjustment and globalisation of the Indian economy have to be viewed in the above context. Existing studies on the three-year progress since 1991 show that while there are large deposits (not trade surpluses) of foreign exchange, economic growth has been well below 5 per cent in the post SAP years. Capital formation is negative, and the capital goods industry is in recession. Also, the presence of MNCs is being increasingly felt and is undermining local manufacturing capabilities as well as R and D. The rising capital intensity is also affecting employment adversely [Kumar

1993; EPW 1994; GOI 1994; Mundle 1992; Unni 1994].

An aspect not specifically studied so far is the impact of SAP on small producers. This paper attempts to assess the impact of the new economic policy (through 1991 to 1993-94) on them. It presents the findings of a set of case studies of units in the small sector. The presentation is such that some generalisations are permissible across sectors. A few alternatives are put forth in the last section. The results are tentative and should be interpreted with caution since the case studies are far too few for a firm generalisation.

NEP AND SMALL PRODUCERS

The fact that India, to a considerable extent, is a small producer economy, has been established earlier. The small producers studied here fall into three broad categories: the primary producers, the traditional extraction/agro-based producers (including fishermen), and the modern small-scale industries. In this section several case studies from each of these three are presented with a view to judge the impact of the new policies on them. The case studies are so presented that they blend with the macro situation in that sector¹.

SMALL FARMERS

Small farmers constitute about 80 per cent of the farming community and operate up to 30 per cent area. Most of these farms are not composite in the sense of being integrated with the agro-processing activities, animal husbandry or allied activities. The total marketed surplus from agriculture does not exceed 30 per cent of the produce; much of the output is either consumed within the rural sector or the producer households. In terms of investments, rural areas are, in general, poorly endowed. Within the rural sector, outside the irrigated belts (that do not constitute more than about 35-40 per cent area), the level of investment is very low.

There is a proposal to declare agriculture into an 'industry', (rather than leaving it 'peasant-oriented'), since the late 80s. A full-fledged policy document was brought out in the 90s. Its salient features are as

follows [Bannerjee 1993] and are discussed with the help of case studies.

(i) Improve crop yields through biotechnology and transfer of knowledge to farmers.

(ii) Focus on selected crops where the country has comparative advantage.

(iii) Reduce post harvest loss by linking farms with agro-technology processing units, which in turn, establish forward linkages for agriculture.

(iv) Globalise agriculture through exports, under the multilateral GATT agreement.

(v) Promote the plantation and tree-crops as major industries.

(vi) Rationalise the existing price-subsidy regimes to promote efficient use of scarce resources.

Farm product exports – mainly rice, horticulture products, tea, coffee, sugar and nuts – had been in the range \$5-7 hundred million annually till about 1991-92 (about \$3b in 1994). The new policy intends to raise this figure several times, beyond \$5 billion. For this purpose, additional crops identified include, fruits, flowers, vegetables, oilseeds and wheat, to name a few. Several large companies, often of multinational origin, have begun to buy food for processing, for sale in local as well as export markets. In some cases, contract farming too is practised (e.g. promotion of tomato growing by Pepsi Foods in Punjab). In most of agri-export processes, modern biotechnology seeds are provided from external sources. The prior requirements are, availability of controlled irrigation, farm equipment, capacity to apply high quantities of fertilisers and access to working capital. Since these preconditions are permissible in regimes of plenty only, this policy has been beneficial to the already well endowed areas and large farmers. It is widely believed in business circles that small farmers have low marketable surplus; they would not be able to handle the sophisticated biotechnology; and they have little access to (capital intensive) drip/sprinkler irrigation systems. Finally, the procurement agencies find it easier to deal with a few large suppliers rather than a large number of small farmers. The prices too of the products marketed by the 'gentlemen farmers' are high and often linked to 'incentives' for growing these crops.

The regime thus is tilted against the small producer.²

The export policy is being promoted to an extent that experts are finding the upper ceiling on landholdings as an impediment (quoted in *Business India*, December 6, 1993). In the coastal regions of Andhra Pradesh and Tamil Nadu small-scale paddy farmers are being displaced from their land (they are becoming migrant labourers) to give way to prawn farming by large companies for export.³ These prawn farms not only absorb little labour, they ecologically degrade the earth by the inlet of brackish waters. In yet another case, it has been observed that goat meat export has reached very high proportions. Goats are often reared by small farmers to supplement their incomes/consumption and their droppings are used as manure. An estimate shows that such indiscriminate export may hurt the small farmers as well as create shortages of organic manure (observations made in Maharashtra and Andhra Pradesh). India has already begun import of manure from Holland (*The Times of India*, April 3, 1994).

Next, the agricultural modernisation programme (within the overall agricultural policy) has three elements, irrigation expansion, rationalisation of the cropping pattern for integration into the market, and use of fertilisers. The irrigation schemes of the surface type are displacing a large number of small peasants – the damming of the Narmada river is a case in point [TISS 1993]. The waters of large surface irrigation dams have a distribution system in which the small farms, often located at the tail, receive very little water (observation made in Orissa).⁴ Also, since 1991, the canal irrigation charges have been rising at about 20 per cent per annum, which disturbs the financial balances of small farmers more than those of the large (observation made in Maharashtra). In places where the reliance is more on the underground aquifers, the water tables have dropped beyond 2-500 hundred feet, and motors up to 10 horse-power are required, to pull the water. This is particularly true in the semi-arid areas. The small farmers are unable to access, or use to full extent, motors and pumps of that magnitude; as a result, they have to rely on the scanty and uncertain rains.

Use of electric power for irrigation is crucial. One of the conditions of foreign companies to invest in the power sector, is ascertaining a high rate of return on invested capital. Presently, most electricity boards in India are running in losses due to power plant inefficiency, transmission losses and theft. As of today, farmers pay a flat tariff rate based on the horsepower of the motor installed (seen in Maharashtra). The government intends to raise the tariffs steeply and meter each watt used so as to pay for the losses and guarantee returns to the

investors. Considering the fact that even today, small farmers survive by imputing their own labour at abysmally low wages in the semi-arid areas, their economy would be completely jeopardised by this tariff rise (inland Maharashtra, West Andhra Pradesh, Northern Karnataka) [Acharya 1993].

Fertilisers were subsidised to an extent of Rs 40-60 billion in the 80s [Gulati 1989]. These are now being phased out. The prices of nitrogenous fertilisers (urea) have risen from Rs 4 to Rs 6 per kg, while phosphorous-based fertilisers from Rs 8 to Rs 15, through 1991 to 1993. Many small farmers (as observed in south-eastern Maharashtra) have reduced their inputs of phosphate fertilisers by 30-35 per cent, and raised the nitrogenous fertilisers as substitute. Phosphorous strengthens the stem, fibre and seed of a crop plant, while nitrogen helps in plant growth. The result is obviously not the same by the substitution: the grain yield is less and the plant has more leafy growth. The crop is more fit for fodder than human consumption. Small farmers, who, to a significant extent, sow for self-consumption, lose because their need is more of grains and less of fodder.

The policy envisages rationalisation of prices and subsidies, again to integrate agriculture into the market system. A survey of small farmers in south east Maharashtra showed that small farmers mainly sow sorghum and millets while large farmers grow oilseeds, pulses, sugar cane and cotton. The smaller ones, for want of enough land and other inputs, are not able to introduce diversity in their cropping pattern. The input prices, for reasons stated earlier, are rising for all crops, but the output prices show a corresponding increase only in the latter. The stagnation in the prices of coarse grains (at Rs 2.30 - Rs 2.50 per kg) over 1991-93 has resulted in a less than Rs 1000 per hectare net earning to the small farmer (early 1994 data).

Even the price of Rs 2.30 stated above is not always available to them. Agricultural markets fluctuate considerably – the prices of sorghum dropped to Rs 1.40 per kg. in January 1994 in some local markets. The capacity of the small operators to wait till the market rises again or transport their produce to distant markets, is limited; as a result they lose further. There is a government scheme of fixing floor prices, but the procurement agencies are marked by corruption and delays.

In the early 1970s the disadvantage of the small farmers was recognised and a special set of programmes for them (SFDA and MFALA) were established. In 1980, these were merged with other anti-poverty schemes, thus diffusing their focus [Vyas 1993]. In the 90s, under the SAP, the financial system has become tight. The interest rates are high, priority lending for the rural farm sector is under question, and criteria of

'bankability of projects' are increasingly being imposed. In fact, one of the banking reform committees has recommended closure of 'Joss making bank branches' in the rural areas. While in principle, a bank is expected to be accountable to its creditors, lack of infrastructural development has not permitted the small borrowers to put forth strictly bankable propositions in all cases. They are thus losing on anti-poverty programmes too.⁵ The small farmers are, thus unlikely gainers of the new agricultural policies.

FISHERIES SECTOR⁶

Estimates indicate that about 80,000 fishermen are directly, and about two million indirectly, employed in this sector. Over 80 per cent of the vessels operated are artisanal (small) craft (including catamarans and dug-out canoes) or motorised units (also small); the rest are mechanised units (which include trawlers (about 2,000) or large mechanised boats with modern fishing gear). The small motorised units are 10 to 20-foot vessels which have engines fitted on them.

A mechanised trawler (which has sophisticated gear to trace shoals) can stay at sea for four or five days while the smaller craft cannot sustain for more than a few hours. The fishing season is of seven to nine months. The peak season lasts for a couple of months. On an average, artisanal fishermen/small motorised boats operate their craft for not more than 125-150 days a year, while trawlers can stay beyond 250 days. The average earning of an small artisanal fisherman does not exceed Rs 40 per day.

The total catch of fish in India in 1992-93 was 4.3 million tonnes [CMIE 1993], out of this, about one-fifth was exported. The Maharashtra merchant class (big trawler operators-cum-traders) catches 40 per cent of the state's total fish catch while Gujarat's merchant class catches 50 per cent. These figures show the extent of access, by boat type and size. Both, the small and large fishermen, however, contribute to exports.

Since the time India embarked on the structural adjustment programme, it has feverishly directed its policies towards market-oriented schemes. Augmenting fish production and seafood export earnings is the core scheme of this policy; and valuable fish resource is seen mainly as a source for export for earning foreign exchange. As a follow up of these plans, the government has drawn up an ambitious agenda to additionally introduce 2653 deep sea fishing vessels. These vessels aim to bring to shore, mainly the export variety fish; discarding large quantities of 'trawl by-catch'. Licences are issued to many Indian business houses to import fishing vessels, and to enter into collaboration with foreign companies. Several such licences have already been issued⁷. For instance, Cochin-based Innovative Marine Products have tied up with

four companies – Mitsubishi of Japan, Saudi Fisheries, Gourmet Club of the US, and Sea Products of Italy. Integrated Rubian Exports, Kerala, began commercial operations in October 1992 and has reached a turnover of Rs 160 million. It has tie ups with Denmark and plans to start a joint venture in Bahrain (*Business India*, December 6, 1993).

In addition, the government has removed all barriers for foreign entrepreneurs to invest in India's Exclusive Economic Zone; which in the present scenario may bring in the necessary foreign exchange, but may affect the marine life ecology seriously since trawlers fish everywhere – inshore, offshore, deep sea – and are indifferent to the type of fish netted or the breeding season. This policy promotes big operators. It is also oblivious of the ecology. There is little in it which may be of consequence to the small fisherman.

Detailed talks with the Versova Machhimar Vividh Karya Kari Sahkari Society (Bombay) members and some informed people revealed that the problems encountered by small fishermen here are not very different from those found elsewhere in the state and country. The fishermen and women in this co-operative are engaged, both in indigenous fishing as well as fishing with the help of small motorised units. Fishing remains a traditional and caste-specific activity 'Kolis' in Maharashtra are engaged in it. The other caste workers are engaged in the related non-fishing activities (e.g. auction and sale of the fish catch).

Fishing is a seasonal activity and depends heavily on the environment. In the absence of motorised units with some, their livelihood is directly affected by the changes in the environment. Earlier, the fish in the creek (Malad) area was readily available. This catch has become very scarce in the recent years due to the pollution created by waste disposal from the chemical industries in the vicinity of the creek. The problem has been exacerbated due to the lack of sufficient motorised units which can go relatively further into the sea.

During the 90s, pomfrets and shrimps, which are now available only in the deep seas, are available in smaller quantities. The overall catch quantity has reduced, from 100 kodis to 25 (1 kodi = 22 pieces) per trip in a small boat. This, as per local reports, is due to over fishing in the area by the heavy trawlers harvesting fish beyond sustainable limit, thereby changing the pattern of their habitat. In addition, an analysis of the catch composition shows that many demersal species have declined, confirming indiscriminate and overfishing by trawlers. A similar trend, it was reported, is observed in the coastal shores of Kerala, West Bengal and Andhra Pradesh [Singh 1993]. This change has, as yet, not so much affected the big mechanised units since their reach is far wider than that of others.

In recent years, there is rise in the demand for fin fish, especially those available at some distance from the shore (along with shrimps). This has hiked the price of fin fish. Some small fishermen with improved technology are able to make more trips to the sea, and are able to go greater distances. The motorised boats have saved them from the drudgery and helped them to rapidly harvest shoals at greater distances. Despite this, there is reduction in both, individual and total catch, for reasons stated above. Thus, fin fish too, which a few years back were considered worth little, are vanishing.

Private traders have paved their way in this sector. Beach auctions are common, in which the traders buy the fish from the fishermen, soon after the latter bring in their catch. These auctions take place within moments after the catch lands. The bargaining power with the fishermen is low because of the high perishability of the product and they are not able to get a price similar to what the traders get, when they (the traders) sell this produce onwards. The fishermen have been unable to vertically integrate their activities so as to obtain the full benefits of the market.

Each member is entitled for loan from the co-operative, which is given from the commission the members pay to the co-operative, for arranging the sale. The loan is used for repairs, equipment, and for other personal contingencies. The reduction in catch, along with little price advantage, may affect the loan quantity, it is feared. The presence of private merchants may increase the price of repairs, gear and equipment; which may place further pressure on small fishermen. There is a possibility of fishermen giving in to pressures from auctioneers for further lowering prices.

The story of this co-operative indicates that the co-operatives have not developed linkages with the appointed merchants of export companies, or even with those who sell fish in the markets. As a result, a great deal of the price margin is taken away by the middlemen-traders. As of today, the co-operatives play a significant role only in arranging beach auctions of the catch of the small fishermen.

A reduction in catch, low prices, and limited access to cold storage facilities is likely to hit the artisanal fishermen the worst. They may be forced to seek alternative jobs. Since most do not have any skills other than catching fish, only menial jobs will be left for them. There are cases in Kerala where fishing technology has led to marginalisation of fishermen: they have become casual labourers [Singh 1993].

RURAL ARTISANS

Promotion of crafts and tiny traditional industries has been an oft repeated objective in the post-independence period. A number of manufacturing activities, that are labour-

intensive, use traditional technology, and yield simple products when seen in the context of the extant market demand, have been termed village artisanal industries. In the post-independence period, it was envisaged that some of these activities could be promoted with a view to generate employment, since the capital goods investment was not expected to create much of it. The total production of the village industries (VIs) sector in 1992-93 was about Rs 29 billion, and the employment, about five million persons. Its export was of the order of Rs 80 million [KVIC 1993].

The VIs have been facing stiff competition from the modern manufacturing sector. Their survival has been ascertained only because, (a) there was partial state support, (b) some of the products in the sector enjoy a place in the highly volatile fashion markets, and (c) some products could be marketed in places where the large-scale sector products did not make an entry owing to the wide geographic spread of village habitats. Since the mid-late 80s when the modern industrial sector began to expand rapidly, the VIs have faced a difficult time. It is estimated that at least half a million handloom weavers have been out of job and the earnings of village artisans have not risen beyond subsistence for several years [NCRL 1990]. In the 90s, when the size of the modern sector is rising even faster, its penetration into the rural markets is becoming increasingly viable, and its products are replacing those of VIs. The problem is compounded by the credit squeeze and subsidy reduction faced by the VIs due to the financial sector reforms.

Some small sector producers were interviewed (in peninsular India) for understanding their specific problems. Almost all reported that there was lack of 'level play' between the modern sector and them for reasons pertaining to lack of infrastructure, credit, quality control, investment, and market access. The investment in the VI sector throughout the post-independence period never exceeded one per cent of the total Five-Year Plan outlays, and this figure went down to 0.46 in the early 90s [Singh 1994].

The khadi sector⁸ employs about 1.4 million persons (on full and part time basis) (1992-93 figures) and provides supplementary income to rural households. The emergence of synthetic yarn has reduced the demand for khadi weaving. Even in spinning the finer varieties (30 counts and above) have become the domain of the mill/powerloom sector. Efforts to make polyester blend khadi are slow and limited. In the late eighties and nineties raw cotton/yarn was exported in large quantities. This rapidly raised their price. The mill sector was able to buy large inventories and raise the price of their yarn and cloth. The khadi producers were not able to raise adequate funds for

Status of Panchayati Raj in the States of India 1994

General Editor
George Mathew

With the adoption of the 73rd Constitution Amendment, panchayati raj has attained statutory status with all states in the country enacting legislations in conformity with the amendment. What is the history, tradition, structure and functioning of the panchayats in various states of India? What is the status of the local government institutions on the eve of the new panchayati raj system coming into force? These and various other pertinent questions are answered in this book containing twenty-five chapters – one chapter for each state – written by senior officials and academics from the respective states, backed by an expert research team of the Institute of Social Sciences. With maps detailed data about districts, socio-economic profile of each state and an introduction tracing the historical evolution of panchayats in the country from the earliest times, this book gives in one volume all one would like to know about Panchayati Raj in the states of India.

inventory and were not able to raise price since the demand for their products is highly elastic. This sector has 50-80 per cent of its institutions defunct for want of funds and technical assistance (*Business Times*, April 6, 1994). Funds released for capital expenditure are grossly inadequate, with the result that several centres have used up to half of their working capital for infrastructure. The effect: the targeted production is not achieved. The average earnings of a khadi worker have reduced to Rs 8 to Rs 12 a day.

A pulse processing unit in the VI setup consists of two stone blades which grind and polish the pulse. The source of energy is manual. Such a unit, in the small scale, is able to process about 25-100 kg of pulses a day. The large units have a much higher productivity. The (imputed) cost of processing a kilogram in a VI unit is about Rs 0.30, compared to Rs 0.10 in a large one. Costs become comparable only when the earnings of the VI workers (mostly self employed) are imputed at less than the subsistence rates. This is possible in cases where this VI activity is a secondary occupation; which is not always the situation. For a long time, the VI type units thrived because they processed only for people living in small hamlets. Now, with the emergence of rapid transport (vehicles of light commercial type, manufactured in the country since the 80s) the market (procurement and processing) is controlled by some who own these vehicles and the large power driven units. The cottage sector is virtually extinct.

The south and east parts of rural Maharashtra have rich black cotton soil which is ideal for sunflower/safflower production. Under the VI sector, a number of oil extraction units had been set up earlier, which were essentially in the small scale, using bullocks or small electric motors (5-7 horsepower) for energy. The edible oil shortage in the 80s resulted in major incentives to grow oilseeds on a large scale. Following the success of the technology mission on oilseeds, the need to vertically integrate the agro-industrial linkage saw the emergence of large sized oil expellers, which supplied oil to large companies (many in the multinational sector), which further processed, packed and sold the oil under their brand names. The large-scale sector has begun to produce edible oils, priced differently for different sections of the society. The by-product – oil meal cakes used as cattle feed – is a major export item from India, which sold for over Rs 15 billion in the international markets, in 1992-93 [CMIE 1993]. The capacity or perhaps the need for small-scale expellers is now extremely limited; perhaps only for self consumption of the relatively poorer consumers in remote village settings.

The control of the MNCs on the manufacture of soaps and detergents has

recently been enhanced with their merger with major Indian companies. In this Rs 30 billion industry the small producers have a less than 10 per cent share. Small-scale manufacturers of soap use exothermic heat generated by reaction of caustic soda with organic fatty acids in place of external sources of energy. They are therefore energy saving. There are about 5,000 such units catering to the needs of the weaker sections of the society, inexpensive laundries and washermen. About 250 thousand people are employed in this industry, which, besides soap, also manufactures several by-products used in the cosmetic industry. Till 1994 the 'non-power using' soap and detergent manufacturers had been exempt from excise duty. Henceforth a 10 per cent excise duty has been imposed on them which brings them at par with the large manufacturers, says a representative of the Association of Small Soap Producers (*Business Times*, March 8, 1994). Unlike Hindustan Lever (the biggest multinational in the business) that has raised the prices of its soaps five times since 1990, the smaller ones have not been able to raise their prices to any significant extent, lest their market share falls. The profitability, as a result, has come down to 2.5 per cent on sales. Competition from the large sector and the new tax threaten to rapidly make this sector financially unviable, says the Association spokesman.

These short case studies illustrate how the open market policies have exposed in VI sector to unequal competition, since these have had inadequate research and development, low infrastructure, inadequate marketing facilities and lack of credit access. Many units face closure due to which unemployment may rise.

MODERN SMALL INDUSTRIES

Modern small-scale manufacturing industries, as per the present definition, are units which have a fixed capital not exceeding Rs 6.5 million (7.5 million in the case of ancillaries). As per the 1988 Census, there were a total of about one million such units in the country, employing about 3.7 million workers. Their total production stood at about Rs 430 billion. An average (working) unit had a plant and machinery size of about Rs 150 thousand, produced about Rs 700 thousand rupees worth of merchandise per year, and employed about 6 workers.

In the new economic policy reservations are gone which exposes small units to competition. Credit is not so easily available; and transfer of foreign technology is not easy to them compared to the large ones [Sandeshara 1991]. A talk with a representative of an Association of Small Industries brought forth a few issues that related to the small industry activities. First, with the opening up of all markets to all types of producers, the small industrialists

will find it increasingly difficult to compete with the large and multinational companies, in costs, quality and market reach. With the restrictions on the scale of production released, most big producers are choosing to produce at larger scales, so as to allow them to feed almost every segment of the market. For example, with the merger of TOMCO and Levers, the combine will be able to produce soaps for each segment of the market, and there may be little place for others. The Association representative felt that in the future except products which did not enjoy economies of scale, all others would be manufactured in large factories. The small firms will have to play the role of ancillaries and service units.

Even in this role there are restrictions. With the introduction of computerised numerically controlled (CNC) machines and flexible manufacturing systems (FMS), the precision in, say, the high technology machine-tool industry (maybe in some others too) has visibly risen. Many major units prefer to install manufacturing facilities in-house for the sake of this precision rather than resort to a putting out system. If the small-scale industry is not equipped with such high precision technology, it may not be able to act as a successful ancillary [Annavaiah 1993].

A further problem stated was non-availability of skilled labour. High technology firms require highly skilled personnel, which are not so easily available to small firms, due to their incapacity to pay, and limited upward mobility offered by them to the workers. The relatively larger firms in the small sector – say those having fixed capital of Rs 5 million upwards – are able to attract skilled manpower; others find it difficult. Thus, with the proposed restructuring when ancillarisation takes full shape, the relatively large units (in the small-scale category) would have better chance of survival on this count, compared to the relatively smaller ones. In essence, in a country of high illiteracy and overall low skills, the rent on high skills is too high for the small units to afford. This discussion refers to the industry in general. Observations made in some specific modern small firms, as observed from select case studies, are discussed below:

(a) Computer Manufacturing

This is a relatively new industry in India – the first manufacturing unit was set up in the mid-70s. In the early 90s, the computer hardware industry size was about Rs 12 billion, out of which about Rs 600 million (5 per cent) was controlled by the small producers. India does not possess the commercial technical expertise to make integrated circuits (which are fitted on mother boards), disk drives or memory chips. These parts, which are imported, constitute up to 60 per cent of the value of the computer.

The rest, namely, the monitor, key board, power supply unit, etc. are manufactured locally. The manufacturers – big or small – put them together according to a predetermined design.

Most larger manufacturers have either entered into collaboration with foreign companies like Olivetti, Dell or Hewlett Packard, or have opted for outright purchase of electronic designs from overseas companies. The smaller ones import ready-made mother boards. The rest is little more than screwdriver technology, for both, the small and large. The price tag on machines manufactured by the small operators is less by about 20-30 per cent.

The product market reflects a clear segmentation: all government, big industry (private and public), and major commercial organisations, purchase 'brand names' from the larger manufacturers; while individual professionals or small commercial companies buy from the smaller ones. One of the reasons why small producers fail in carving a larger market for themselves, is their incapacity to compete against large tenders or deposit large sums of earnest money. Others relate to the range of their produce (they are able to set up only PC models), lack of advertising/marketing, and limited geographic limits for supply (and service).

Earlier to 1991, the smaller units enjoyed a flat rate of depreciation allowance of 25 per cent. This has now been cut, they get 25 per cent for the April-September period, and only 15 per cent for the October-March period. Next, the excise duty for units with sales up to Rs 1.5 million, was nil earlier. Now there is a 15 per cent *ad valorem* duty for all. With these additional taxes the small manufacturers' margin of profit has reduced. To offset the scale disadvantage, they try keep wages low. As a result they are not able to employ qualified workers, and their after sales services are poor. This further narrows their market."

One of the ways devised by some 'traders' has been to smuggle parts from overseas and sell them in the 'gray' market. These are cheap because no duty is paid on them, but are illegal. In a bid to survive, the smaller makers buy goods from the gray market and sell unmarked computers against cash payment and give no receipts. This kept up their margins – even though illegally – for some time.

In the 1994-95 budget, the customs duty on computer components were slashed so as to reduce smuggling. The excise taxes have however not been reduced. As a result, while the gray market will shrink, the small producers will have to face stiffer competition.

(b) Leather Garments

Leather and leather goods, is a Rs 60 billion industry in India [1992-93 data see

CMIE 1993]. About 40 per cent of the product is exported, which makes it a major export earner. Most leather goods manufacturers are in the small scale, scattered across centres in Tamil Nadu, Uttar Pradesh, and Andhra Pradesh. The tanneries which supply high quality processed leather are mainly concentrated in Madras though there are other centers too. The leather goods exporters principally rely on the tanneries in Madras [CLRI 1990].

A group of small-scale leather manufacturers and exporters (gross sales about Rs 3-5 million each per annum) was interviewed in detail. They stated that the buyers (from overseas) always compare Indian goods with those from China. The Chinese use cutting and stitching machines which are at least 20 to 30 per cent more efficient than theirs. The break downs too in them are less in comparison to Indian-made machines. These (German and Japanese made) machines are not so easily accessible to the small and tiny producers here. Since the Chinese set the standards and prices, the Indians have to follow. Due to this, the rate of return on their efforts is low. This (technical) problem is compounded by the fact that skilled labour is difficult for the small and tiny sector to retain. In reality, the small and tiny units have become training grounds for the fresh workers who ultimately join larger ones for more steady jobs.

Small-sector units, even if they are export-oriented, are not favoured by banks and financial institutions for credit. These institutions look at conventional ratios and size of capital to judge the extent of creditworthiness of the borrowers. Since these are not always satisfied, the credit at times is delayed by up to a year. Letters of credit are not honoured by banks at home, thus denying working capital to these units. The informal market interest rates are as high as 30-40 per cent, which eat into the profit margins. International banks and financial institutions too, do not encourage small and tiny firms to avail of their services. Raising equity in foreign markets is a distant dream.

International marketing is not easy, certainly not for small firms. They have to go through intermediaries which provide brand names – at times more than one – and the units are required to manufacture under their trademark. Considerable value added is taken away by the intermediaries since the cost of marketing (advertising, etc) cannot be borne by the small firms.

The raw material required for production of leather garments is refined leather, which is controlled by a few (Madras-based) dealers. These dealers find it cumbersome and expensive to deal with a large number of small users. They prefer to trade with a few large users. Access to dealers by the small manufacturers has been identified as a major

constraint. At times, they have to go via a few regional intermediaries and pay more; and at others, run up their inventories beyond their needs. These are major constraining factors.

Leather being an export product, the small and tiny producers feel that they should be provided with incentives such as tax reliefs, and stalls to advertise their products in international trade fairs. These facilities, at present, are not provided to them. They further complained that the import-export process is bothersome and requires too much paper work. If the procedures are simplified, their administrative cost would reduce. Lastly, it was stated that little research is done to meet the R and D needs of the small firms. There is emphasis on basic research and not on the problems of small units.

(c) Readymade Garments

Readymade cotton garments export is perhaps the largest net foreign exchange earner (Rs 70 billion in 1992-93). There are large factories which use power driven machinery to produce standard garments mainly for the domestic market. Next, there are a large number of tailoring and fabrication units that are (in most cases) sub-contractees of marketing enterprises. Exports mainly originate from the small sector. Division of labour is achieved by sub-contracting different processes to different units. The capital cost too is laterally spread. This diversification is highly cost effective in this (seasonal demand) industry, since both, capital and labour are cheaply available and can be seasonally activated [Chatterjee and Mohan 1993].

Export of garments is subject to the Multi-Fiber Agreement (MFA), according to which each country is permitted to export, to the US and EEC region, subject to certain quota restrictions. The destinations of over 70 per cent Indian garment exports are in the US and EEC countries, because of which an Apparel Export Promotion Council has been set up to distribute this quota among different exporters. There are over 10,000 units registered with this Council. Only about 250-odd are manufacturers; the others are merchant-exporters that access the produce from the small fabricating units.

An interview with a few Maharashtra-based small stitching and fabricating units revealed that apart from some common problems of non-availability of credit from institutional sources, problems of marketing, and high labour retaining costs, there were some industry-specific problems arising from the new economic policy. These are discussed here.

Most of the trimming equipment is imported, and subject to high customs duty in spite of being employed in 100 per cent Export Oriented Units. There is a provision for part-refund of the duty once it is 'proved'

that the equipment is actually used for export purposes. The bureaucracy here is more than bothersome for the owner-managers. Next, it needs mention that the Indian made stitching machines are only half as efficient (2,000 stitches per minute) compared to the imported ones. Imports are permitted but concessional customs duty is allowed only if the exporters are able to increase exports, equivalent to four times the *cif* value of the imported machine, within a period of 5 years. This implies that the annual net exports to capital ratio, be about 0.80. One exporter calculated that, this policy, if applied to his unit, would imply that he would have to raise his exports by three times the current value within a period of six months. Non-availability of the latest technology shows up in the unit value realisation too: countries in the Far East earn 50-70 per cent higher for the same volume of garment merchandise.

The problem in quality indicated here emerges from the non-availability of fabric too at appropriate prices. Industry sources say that 60-70 per cent of the major yarn counts used for garments are being exported. As such it is alleged that about a third of the 150 odd million kgs. of yarn produced in the country is not of export quality; and yet yarn export is unabated. Since December 1993 till March 1994, the price of yarn (of the 20s and 30s count range) rose by about 50-60 per cent, and of fabrics, by about 30-40 per cent (*Business Times*, March 24, 1994). With the export market being highly quality conscious and price elastic, the small producers are finding it hard to balance between quality and profit margins.

It was mentioned earlier that apparel producers are subject to MFA, due to which quotas are distributed to exporters. Prior to 1991, this was distributed according to volume and price, but later, with a view to attain maximum unit value out of every exported piece, a past performance entitlement (PPE) was stipulated. This requires that quotas would be given, based on the past performance (three to four years) of a company. The quotas would be valid for six months. They can be freely transferred by the quota holders. In principle the PPE policy is sound, but in practice, (a) there is an emergence of 'black market' for the quotas in which the relatively well established units sell portions of their quota to others; and (b) new entrants find no way to enter the market other than through the black market route.

There were a number of administrative difficulties too quoted, all of which raised the unit cost of manufacture. First, most exporters require advance licenses for import. These are issued in New Delhi, and it is expected that producers go to New Delhi for procuring these. Next, merchandise clearance at ports, and the involved paper work; take up to two months in the Bombay port compared to a few hours in, say, Singapore.

Lastly, the export subsidy, which they got earlier, has been withdrawn, as part of the IMF conditionalities.

In essence, the garment exporters said that these problems may not permit them to maintain their 20 plus per cent export growth, as in the recent years.

(d) Mini Cement Plants

The Indian cement industry is worth about Rs 40 billion (1990-91 figures). Most units are established at limestone pit heads, as typical to a weight losing industry. The process of manufacture entails mixing crushed limestone and clay in a rotatory kiln to obtain granular clinker, which is then powdered and refined to make portland cement. Nearly all manufacture takes place in large units of over one million tonnes capacity each per annum. The fuel used for fusion is coal and electric power.

Cement has also been manufactured by smaller units (up to 10,000 tonnes per year) using vertical shaft kilns in place of rotatory ones, which burn coke dust as fuel. This technology was conceived when it was found that steel plants generated a lot of coke dust as a by-product, which otherwise went waste. These (mini) plants are able to produce most grades of cement (e.g., 33, 45, and even 53) depending on the availability of raw materials. An interesting comparison between one large, and 100 small units established in a cluster, was presented by a small mill owner. The summary data are as below.

This table shows that for most grades of cement, small units have a fixed cost and energy advantage, and they provide more employment. Next, a vertical shaft kiln can be fabricated on the spot while a rotatory kiln requires manufacture in large factories. There are several such mini cement plants in operation in China.

One of the main problems in the recent years has been non-availability and high price of coke dust. This product, till recently a waste, was sold at Rs 200 per tonne in 1986 to the mini cement plants. By 1993, its price rose to Rs 1,500. Even at this price the material is difficult to obtain. The small units can match the prices of the larger manufacturers if the coke dust cost does not exceed Rs 500 per tonne (1993 prices). It needs mention that coal, which is used by the bigger factories, still sells at Rs 600 per tonne (up from Rs 150). Many mini cement operators have truncated their operations due to the price of coke dust: they now buy

clinker from the bigger factories, process it into cement, and sell it.

In early 1994 an excise duty of Rs 12 per (50 kg) bag was imposed on production from mini cement plants. This has further eroded the margins of these units. Several of them are shutting down. At another level, the mini plant operators said that in a weight losing industry like cement, if a number of units are located in a neighborhood, railways can effectively be used for transporting in limestone and transporting out cement on a cost effective basis. At present the plants are scattered at distant locations. As a result they are forced to use road transport which is three times more expensive than rail.

Lastly, in a market economy, the buyers – who in most cases are large distributors or users prefer to obtain uninterrupted supplies at minimum administrative cost. As in other cases, they prefer to negotiate with a single large unit (or be appointed agent of, as is the industry terminology) rather than be market agents for small firms. A similar argument applies to input supplies from limestone quarries. A mini plant owner stated that small firms did not require subsidies or protection; what they needed was innovative planning and implementation at the macro level.

(e) Rubber Products Manufacture

The rubber industry, which mainly caters to the tyre and tube requirements (up to 75 per cent), also has a fourth of it producing a range of items like fan belts, household appliances, surgical equipment, packings, etc. The tyre industry is fully in the large scale, but the latter are produced by both, small and larger units. There is some export of rubber products but it does not feature as a major foreign exchange earner.

Most natural rubber products face stiff competition from synthetics. The latter are cheaper and can be used with higher versatility. Till February 1994 there was some tax exemption enjoyed by the small and tiny manufacturers on inputs. Since then it has been withdrawn. In this context, a plea on behalf of 7,000 small and tiny rubber units, was published in a leading newspaper (*The Times of India*, April 4, 1994).

Three small manufacturers were interviewed. Their units make fan belts and some other accessories for automobiles. The owners said that small rubber units are not getting any market direction after 'level playing' with the larger units and international companies has been established.

	Large Unit (One Million Tonnes/Year)	100 Small Units of 10,000 Tonnes/Each
Capital cost	Rs 2-3 billion	Rs 1-1.25 billion
Employment	300	5,000
Nature of employment	High qualified	Mainly semi-skilled/low qualification
Energy use	125-135 units/tonne	90-100 units/tonne
Quality	All grades	Most grades

They also complained that competition from synthetics, and high taxes, have created an environment of uneconomic production. The only reason they survive is the 'gray market' production in parts of northern India (i.e., production for which taxes are not paid). They buy from there and sell in metropolitan cities. They have essentially become traders rather than manufacturers. Import of machines that process synthetic material was ruled out since such machines are not manufactured for small scale production. Small scale rubber manufacture, according to them, is a dying proposition under the present market conditions. These case studies reveal that the small producers are none too happy after the implementation of the SAP. While not all of their problems can be attributed to the said programme, some certainly can.

CONCLUDING OBSERVATIONS

The small scale sector, with its limited productivity and elementary technology, produces a substantial quantity of production and provides an even larger proportion of employment. The case studies data show that the units in this sector have uniformly been affected by the new policies on one count or the other.

The present policies are oblivious to the problems of small farmers and other primary sector producers, particularly in the semiarid regions. While high value added production for export from the already well endowed areas cannot be avoided, concerns of local food security are equally as vital for most other parts of the country. It has been established that marginal lands and small farmers can be viable economic propositions in the presence of infrastructural facilities, appropriate technologies and suitable social organisation [ILEIA 1992]. There is need for a great deal of effort to set up all these. The same argument applies to other primary sectors.

Arguments relating to natural products such as fish are more complex since there is an added dimension of ecological degradation. The case for state intervention is much larger here. The problems of small producers in the artisan and small industries sectors relate to markets (of both factors and products), technology access, credit and quality manpower. These problems are endemic because the big and the small will always be unequal in the market as long as they compete. Forms of complementarity will therefore have to be envisaged if the small scale sector is to survive. A few pertinent elements are stated here:

(1) The place of some small industries as ancillaries can be ascertained through technological strengthening. The problem of access to and assimilation of newer technologies can perhaps be approached by institutional arrangements on the one hand and infrastructural development on the other.

(2) Next, within the modern industrial system in most industrialised countries, small enterprises are extensively engaged in the services sector. In India there are far too many small units manufacturing products which are in competition with large scale production. Some of them need transition to the services sector. It is a recognised fact that most services can effectively be delivered by the small operators.

(3) Lastly, the credit and finance institutions, other things given equal, can afford not to have dual policies for small and large sectors.

SAP has been successful in countries which have had flexibility for change: like developed infrastructure, substantial human endowment, ready access to technology, food security, etc (eg. South Korea, Australia). It follows that small producers can be partners if the conditions for economic flexibility are achieved and level playing conditions established.

Notes

[A larger version of this paper was presented at an ITDG seminar held in Colombo in June 1994. The authors would like to thank the ITDG for financial assistance. Co-operation extended by different small industry associations and individual producers was most helpful. J Kurian, S Joglekar and S Narwade, helped in the preparation of this paper in different capacities.]

- 1 Most case studies here are done on an *ad hoc* basis. For example, no sampling exercises, etc., have been under taken. Effort has however been made to keep a broad, sector specific representation
- 2 The modern biotechnology products promote mono-cropping, as well as high resource intensity. The ecological impact of these could be quite high, according to some experts.
- 3 My conversation with Radhakrishna (Hyderabad) and Shanthi (Madras), have been very useful in this context.
- 4 Informed sources say that such a situation prevails in many irrigation projects in the country
- 5 In a recent event, a sericulture project, meant for the weaker sections of the society in the rural areas, was refused funding by banks on the grounds that poverty schemes were on low priority, even though this project was a sound bankable proposition. The first author of this paper was involved with project.
- 6 We are grateful to John Kurien and M Devraj for introducing to us the different facets of the fish economy in India. This section liberally draws upon Kurien (1993).
- 7 Till recently, when the licensing system was still prevalent, permission to expand production beyond a size was not given to the large scale sector. The units, in turn, did not find it economically feasible to expand marketing beyond the urban areas when their production base was limited.
- 8 All the data in this section are drawn from, business journals, official sources, and case respondents.
- 9 Cottage soaps are manufactured in both, rural and urban areas. Not all units come under the

VI sector. The production and employment figures given earlier may include only a part of the total data pertaining to cottage soap.
10 The London-based 'Economist' (April 9-15, 1994) too voices the excise duty irritant for the small computer producers in India (see pg 77).

Bureaucratisation, Corruption and Depoliticisation

Changing Profile of Credit Co-operatives in Rural Haryana

Surinder S Jodhka

Based on a field-study of three villages and three primary agricultural credit societies (PACS) from an agriculturally developed district of Haryana, the article argues that the green revolution technology and the introduction of a new organisational structure in 1976 have brought about significant changes in the working of credit co-operatives. Greater bureaucratisation has led to marginalisation of the elected body in the functioning of the co-operative and has led to the alienation of its members.

UNLIKE other aspects of agrarian processes, literature on primary agricultural credit societies (PACS) is, surprisingly, marked by a near absence of debates and differences among the students of the Indian agrarian scene. Ranging from official reports to the formulations of radical scholars, there is a near unanimity in the literature on the subject to link the functioning of PACS to the prevailing structures of landholdings and power relations in the rural society.¹ Formulated in the 1950s and 1960s, the main argument of this thesis has been the successful manipulation of PACS by the traditionally dominant sections of the village. This helped them to reproduce their dominance in the rural society. It also meant that the small and marginal landowners continued to depend on the informal sources of credit making it difficult for them to adopt new technology or benefit from developmental programmes. Consequently, the PACS, rather than bridging the gaps, have in fact widened the differences between the rich and the poor in the rural society.

This thesis has been best summarised by Ronald J. Herring:

The prevailing system of land tenures tends to be reproduced as a hierarchy of differential rights to institutional credit, after preserving the very distinctions which were the core of the "traditional" agrarian system.

the flow of credit tends to follow the lines of power in the village in the case of primary societies, power in the village typically is a mirror image of the land tenure system.

In summary: (1) tenants are less likely than owners to be members of co-operatives; (2) small owners are less likely than large owners to be members; (3) small holders in co-operatives are less likely to receive loans and the co-operatives meet a smaller percentage of their total credit needs compared to large owners (1977: 121-132 emphasis added).

Similarly, on the basis of his extensive fieldwork in different parts of the country, Daniel Thorner concluded:

... there is nothing in the record of co-operatives to suggest that it is the interest of the weak that will prevail ... the evidence suggests that the structure of village power

has imposed, and will continue to impose its own pattern on the co-operatives (1964).

Though a lot has changed in Indian agriculture since Thorner's fieldwork, there has been very little change in the prevailing understanding of PACS. This can perhaps be attributed to what Pandey, in one of his recent articles on the subject, has described as "ahistoric approach" and the "compartmentalised manner" of understanding various aspects of agrarian transformation [Pandey 1994: 863]. As he rightly argues, we need to understand the working of PACS in relation to the changes experienced in the related spheres of agrarian structure, specifically the successes and/or failures of land reforms and the green revolution technology.

Based on an intensive field-study of three villages and the three PACS selected from an agriculturally developed district of Haryana, the article argues that the success of the green revolution technology and the introduction of a new organisational structure of the PACS have led to significant changes in the working of credit co-operatives.

The green revolution technology helped the big, and the very big farmers to generate sizeable surplus. They no more depended on PACS for short-term crop loans. Their surplus took care of the short-term requirements. They also had substantial bank accounts or standing with 'arhtias' (commission agents in the grain markets) and invested part of the surplus in non-agricultural activities. For capital investment, such as buying a tractor, they approached the commercial banks for long-term loans.

Simultaneous bureaucratisation of the PACS in the mid-1970s shifted the *de facto* power from the managing committee and the elected president to the secretary, an official appointed by district co-operative banks. The office of the president no longer offered a source of power and patronage.

These developments have led to (i) a withdrawal of the dominant interests from the working of PACS leading to a near complete 'depoliticisation' of the institution, (ii) the depoliticisation has transformed the institution into a "typical corrupt organisation of the state government"; and (iii) the PACS

have gradually become a source of credit for middle and small farmers and some 'non-agriculturalist' members.

PACS IN SIXTY VILLAGES

Generally, one PACS covers two to four villages. The PACS' office is located in one of these villages, — often in a comparatively bigger village. Out of the three villages studied, PACS' officers were located within the premises of the village I and II while the village III was attached to a PACS which had its office in a nearby village. All the three PACS were formed in the early 1950s² with the initiative of the big and the medium landowners. While the medium farmers were interested in cheap credit, the big landowners had an eye on the membership of the managing committee and the post of president as a source of influence and power. In some cases, school teachers and shop keepers were also among the founding members of the credit societies.

The elected president and the managing committee appointed a secretary and a salesperson from amongst the members. The president would generally be a big landowner while the secretary and the salesperson would be a medium or a small landowner. The PACS' office would be located in the house of the president or the secretary.

On the recommendation of the RBI the state government introduced a new scheme under which the PACS were brought under direct control of the central co-operative bank. This entailed a formalised set of guidelines regarding the fixing of credit limits and appointment of a secretary to take care of the day-to-day functioning of the society. This new 'caretaker' of the PACS was an outsider, a regular employee of the central co-operative bank who was supposed to work as per the guidelines received from his employer. He kept all the accounts and co-ordinated with the district co-operative bank. The PACS office also got shifted from the house of the president to a different site. The managing committee though elected every three years, no longer had a direct control over the secretary and was denied any financial powers.

The PACS advanced two types of loans – crop loans to the farmers and consumption loans to the 'non-agriculturist members'.⁴ The maximum limit of consumption loans was Rs 1,000 for labourers and Rs 2,000 for rural artisans and petty-shopkeepers. The upper limit for crop loans was fixed on the basis of the size of the landholding of a farmer and was Rs 10,000 for the small farmers and Rs 20,000 for the big farmers.⁵ The consumption loans were made available in cash, but in case of crop loans, half of it was in cash, while the other half was in kind – i.e., fertilisers, seeds, etc. These loans were advanced for a period of six months and differential interest rates were charged on different categories of loans.⁶ Money could also be deposited with the PACS but very few members ventured to do so.

Among the three villages studied, the credit society of village II was most popular since farmers belonging to various strata were its active members. This society was also one of the most successful societies in the district. The PACS of village I and village III were more typical of the "societies" in the region, the PACS of village III being the most unpopular.

WHO BORROWS FROM PACS

The conventional view that co-operative credit is a monopoly of the rich and the dominant of a village had hardly any validity in the villages studied. As per the official information, a majority of the active members in the three PACS were the non-agriculturists (57.21 per cent) and the small farmers (26.47 per cent). The big farmers, owning more than seven acres of land, constituted 16.31 per cent. Significantly many members of the PACS (42.3 per cent) had dead accounts. The number of functioning accounts was as low as 44.4 per cent in the PACS III and was 65.4 and 59.6 in PACS I and PACS II respectively. In case of active members, the proportion of non-agriculturists was highest in PACS I (66.7 per cent) and was 52.3 per cent and 50 per cent in PACS II and PACS III respectively. In PACS II and PACS III 21 per cent and 17.5 per cent of big farmers were active while only 13 per cent of them were active in PACS I.

The pattern was slightly different among the respondents of the three selected villages. Out of 185 respondents, 92 respondents (49.7 per cent) were members of PACS yet only 69 respondents (37.3 per cent) were active borrowers. Table 2 shows that farmers owning land up to 25 acres were the most active borrowers. Interestingly, contrary to the official figures, few landless labourers (labelled 'non-agriculturists' by the PACS) borrowed from PACS. Thus, majority of 'non-agriculturist' borrowers must be rural artisans or other occupational groups.

On the other hand, few very big farmers were active members of PACS. They rarely needed institutional loans for financing crops. Of 22 interviewed 14 reported that they have

surplus ample enough to disperse with the agricultural credit. Most of them belonged to village II and joined the PACS to participate in the elections of the managing committee. This was also true of big farmers. Des Raj owning 20 acres of land from village II joined PACS in 1980 so as to vote in the elections of the managing committee. He is entitled to borrow up to Rs 10,000 but in past eight years, has borrowed only once. Devi Lal, the leader of Lok Dal, during his election campaign in 1986 promised waiving of all institutional loans on getting elected to power. So Des Raj borrowed hoping that there would be no need to return the amount. Incidentally, his loan was not waived and he had to repay it, Sham Lal owning 55 acres from the same village was borrowing avidly, not for short-term requirements but for investing in land.

Moreover, for the big farmers borrowing from PACS was 'status-degrading'. The secretary of PACS III had this to say on the issue:

... big farmers in these villages do not need credit. They also feel that borrowing from the credit society would damage their prestige in the village. Everyone in the village gets to know when someone borrows from the society. And for a Chaudhury to be indebted to PACS is an insult. They would not mind borrowing from a bank or from an arhtia but being indebted to PACS is as bad as mortgaging one's land to a moneylender. These values are particularly strong among the big landowning Jats and Rors.⁷

However, the secretary claimed of having succeeded in the last four years in motivating few big farmers to join the PACS. This he was able to achieve because being a jat himself, he could easily befriend them. The big farmers who borrowed from PACS, instead of using the credit, lent the amount to labourers at a monthly interest rate of two to three per cent. Besides generating additional returns, this assured them of the labour supply during the peak seasons.⁸

REASONS FOR NOT BORROWING FROM PACS

An important observation on the basis of the field data is that many respondents were no longer members of PACS nor did they

borrow from them. Though farmers owning up to 25 acres were members of PACS to a large extent, around half of them were inactive. The most significant factor behind this development was the bureaucratisation of the PACS and the prevailing corruption in them (see Table 3). Charges of corruption were reported more frequently from village I and village III. Respondents of village II did not complain about corruption. Also, the village has a better record of participation in the functioning of the PACS. Thus, it can be concluded that there is an inverse relationship between corruption and participation.

The secretary's office became pivotal with the introduction of the new organisational structure in 1976. The managing committee lost control over the day-to-day functioning of the credit society with the secretary appropriating all the power. All complaints of corruption in PACS were against the secretaries and none against the managing committee or the president. Whenever the members borrow from the PACS they have to pay a bribe of Rs 10 to Rs 50 to the secretary. If the borrower refuses the bribe, the secretary delays the loan and creates other bureaucratic hassles. The secretaries take advantage of the creditors' inability to repay the loan in time. In such cases, he charges his "fee" and re-issues the loan without actually having received it. For a person who has to pay a monthly interest of two to four per cent in the informal credit market, payment of bribe was not an "uneconomic" proposition. Over period of time paying bribe becomes a routine. The secretary asks for his fee even when the loan has been re-paid in time.

This practice created apprehensions among the villagers. Lekha Gujjar, holding four acres from village I, was an active member of the PACS two years ago. Frequent cases of corruption and the demands for bribe made him apprehensive of the society and he stopped borrowing altogether. He prefers informal sources of credit. In his own words:

The society is very useful, especially for a small farmer. But I have stopped borrowing because the present secretary is a cheat. One

TABLE 1 MEMBERSHIP OF PACS (COMBINED)*

PACS	Active Members				
	Non-Agriculturists	Small Farmers (Less than 7 Acres)	Big Farmers (More than 7 Acres)	Total Active Members	Non-Active Members
PACS I	250 (66.7)	76 (20.3)	49 (13.0)	375 (100.0)	195
PACS II	225 (52.3)	115 (26.7)	90 (21.0)	430 (100.0)	292
PACS III	100 (50.0)	65 (32.5)	35 (17.5)	200 (100.0)	250
Total	575 (57.21)	266 (26.47)	164 (16.31)	1005 (100.0)	737

Note: * As in October 1988.

Source: Information provided by the secretaries of the three PACS.

cannot trust him. If I borrow, he may manipulate my account. Being an illiterate, I am scared to take the risk. It is better to borrow on higher interest rate than to land up in a serious problem.

Another farmer, owning 14 acres, stopped borrowing six years back. He stated:

I no more borrow from the society. I have had a very bad experience. When I was an active member the then secretary withdrew money on my name by forging my signatures. When I came to know about it I was annoyed. The present secretary is also corrupt. It is better to keep away from the society. Their loans are of no use to us.

Some respondents had to waste four to five days in getting a loan from the PACS. There are too many formalities and if one has to bribe the secretary, the whole process becomes as costly as informal credit. What Hunter wrote about co-operatives seems to apply quite well to the PACS I and PACS III. To quote him:

In a corrupt society corruption will use any channel which comes to hand, and co-operatives are no more (though no less) condemned by this than any other social institution. Co-operatives are treated as another branch of bureaucracy. The secretaryship is just another job with opportunities for gain (1969, 156-157).

PACS are unanimously perceived as a state government institution. Many respondents did not borrow from PACS because they did not want to get involved with any 'official agency'. Small and marginal farmers expressed apprehensions that if they were unable to repay the loan in time, they would be arrested by the police or their land would be confiscated. Some feared losing their creditworthiness on joining the PACS. The villagers prefer their indebtedness to remain a secret. However, this is not possible. Some find it insulting that the secretary, in presence of other villagers, should ask them to return the loan. This damaged their prestige and discouraged them from borrowing again. A marginal farmer with two acres from village III said:

Society loans are not good for a poor man. A small farmer always lives in uncertainties. If one cannot pay back the loan in time, the secretary humiliates the person in presence of other villagers and relatives. One loses one's status. Only a rich man who has money in his pocket can afford to borrow from society and banks. Even a bania is better than the society.

Similar views were expressed by others. 'Status' worried the small and the medium farmers belonging to the local dominant castes much more than those from the lower castes.

UTILISATION AND DEFAULTS

Utilisation pattern and defaults are directly related to the questions, such as, who borrows from the PACS?, how does

the institution interact with the local power structure?, for what kind of needs do the members borrow? With bureaucratisation, patterns of utilisation and default also have undergone significant changes. A large majority of the respondents who borrow from PACS, expend 'rationally'. Most farmers (80 per cent) spend the credit on the crop for which the loan is borrowed. Some spend a part of it on consumption. In most cases farmers avoided borrowing fertiliser bags or seeds from the PACS. They purchased them at a slightly cheaper rate from the nearby towns. However, in cases where a small or medium farmer was unable to mobilise cash from informal source he procures fertiliser bags from the society, sells them at a slightly cheaper rate to some other farmer and uses the cash for his urgent requirement. But, by and large, the 'in-kind' loans were not popular amongst the members. Similarly, of 18 agricultural labourers, 15 use the loan primarily for consumption purposes.

The change in social composition of active members, the bureaucratisation of the institution and the proper utilisation of the PACS loans has resulted in a significant decline in default. Though there are many dead accounts – mostly because of default – those who are currently active did not default very often. Most of the dead accounts were dead even before the new organisational structure came into existence in 1976. There are some cases of 'wilful default' but most of these are of a contingent nature rather than reflective of any trend. The recovery rate of PACS II, as reported on June 30, 1988, was 83 per cent and of PACS I and PACS III

was 80 and 85 per cent respectively." Defaults were mostly due to genuine economic compulsions. There were many cases of wilful default during the year of the field work but these were yet to be declared as default cases. These defaults were a consequence of the election promise of Devi Lal.¹⁰

LOCAL POWER STRUCTURE AND FUNCTIONING OF PACS

As mentioned earlier, literature on PACS has repeatedly stressed the vulnerability of PACS to the local power structure. Instead of empowering the weak and the dependent, PACS credit a monopoly of the rich and the powerful, helping them further consolidate their dominant economic status in the rural society. The PACS in the selected villages did not function on these lines. Neither the villagers nor the dominant rich farmers saw PACS as a useful source of power and patronage. There are two reasons for the withdrawal of the dominant rich farmers from the institution. First, the bureaucratisation of the credit system after 1976 made the secretary, paramount in the functioning of the society. This marginalised the role of the elected managing committee and the president in the day-to-day activities of the PACS. Secondly after the green revolution, the big farmers have enough surplus to take care of their consumption needs and short-term cash requirements for crops. Badloo Gujjar, owning 50 acres, was a president of the PACS I during the late 1970s. However, he realised that the president's post did not profit him in anyway. The only task he performed was to visit a nearby town to attend meetings. He states:

TABLE 2 CATEGORYWISE PACS MEMBERSHIP OF RESPONDENTS

Category	Active Members	Passive Members	Non-Members	Total
Agricultural labourers	18 (24)	2 (2.7)	55 (73.3)	75 (100)
Small and marginal farmers (up to 5 acres)	17 (48.6)	8 (22.9)	10 (28.8)	35 (100)
Middle farmers (5-10 acres)	12 (50)	1 (4.2)	11 (45.8)	24 (100)
Big farmers (10-25 acres)	15 (51.8)	9 (31)	5 (17.2)	29 (100)
Very big farmers (25+ acres)	7 (31.8)	3 (13.6)	12 (54.5)	22 (100)
Total	69 (37.3)	23 (12.4)	91 (49.19)	185 (100)

Note: Figures in parentheses are percentages.

TABLE 3 CATEGORYWISE REASON STATED BY RESPONDENT (NON-MEMBERS AND INACTIVE MEMBERS) FOR NOT AVAILING PACS LOANS

Category	Do Not Need PACS Credit	Bureaucratic and Corrupt	Afraid of Official Credit	Not Aware	NA	Total
Agricultural labourers	0	19	12	26	18	75
Small and marginal farmers	1	9	5	3	17	35
Middle farmers	2	5	3	2	12	24

Very big farmers	14	1	0	0	7	22
Total	22	43	20	31	69	185

for attending a meeting in the tehsil headquarter they paid me five rupees. A visit to the town takes a whole day. Even a labourer gets more than five rupees for a day's labour. Becoming president was of no use to me.

After completing his term, Badloo Gujjar never again contested the post. The current president of PACS I, Jagtar Singh, owns seven acres of land and has no tractor. He is neither popular nor a powerful member but since there are no contestants for the post, he is occupying it for past three terms. When asked about the powers he enjoys and how far his position is comparable with that of the village sarpanch, he replied

A president of a co-operative society is not a very influential person. Compared to the village sarpanch, he is nothing. Earlier, when the financial powers were with the managing committee, the president had some say. Now the central co-operative bank controls everything. The members have an account in the central co-operative bank and they get a passbook in which they have their photograph. They do not need us for getting loans anymore. The managing committee is only a formal body now.

The big and very big farmers have participated more in the PACS II than the other two societies. Many among them are active members and there have been fierce contests for elections to the managing committee. The farmers aimed for membership of the 'block samiti' via the managing committee which offered status or 'chanda' in the village. Jamal Singh, owning ten acres, was recently elected to the managing committee and was hopeful of being chosen for the post of the president. He was member of the PACS since 1970. He could borrow up to Rs 10,000 but in recent past he has not borrowed anything. He has enough savings which he has deposited in a commercial bank. In fact he himself lends money to other villagers. He was clear about his motive for contesting for the post.

As such the managing committee has a very limited role to play in everyday functioning of PACS. But being a president offers some respectability in the village.

PACS III appeared completely free from village politics. The big farmers did not consider it a source of power or status. There have been no elections for the managing committees of PACS I and PACS III for past ten years. The president of the PACS III, Darya Ram, a small farmer owning four acres, sees presidentship making no significant difference to his social position in the village.

The respondents, including active members from lower classes/castes, mentioned the state government or the secretary as the controlling authority of PACS. Some did not even know who the president was. None of the members opined that the society was controlled by big farmers

or that it belonged to the members. Thorner's observation made in early 1960s about the attitude of villagers towards PACS in the region appears valid even today. He wrote:

... there seemed to be little 'co-operative spirit' in the villages we visited. To the ordinary small peasant and bataidar the co-operative was simply a 'village bank' from which he could get a quite modest loan provided he subscribed to a share. (1964: 111)

CONCLUDING REMARKS

If PACS are to function as a developmental state-supported participatory institution by providing cheap credit and thus becoming an alternative to informal sources of credit which are economically and socially costly in reproducing relations of dependence, the least one can say is that the PACS have only marginally achieved this objective. Though there has been a near-complete transformation of the rural credit market and most of the ex-bania moneylenders have moved out of the villages into urban occupations, the PACS have hardly played any significant role in this process. Nor have the PACS become an alternative source of credit for the farmers and the labourers. Nearly 64 per cent of those interviewed were not even active members of the local PACS. A majority of small/marginal and medium farmers, who need credit for investment in crops, did not see the PACS as a viable alternative to informal sources such as arhtias.

The obvious reason for this is an absence of any kind of co-operative movement from below. PACS do not function as participatory co-operative institutions. Their image is more of a small-scale commercial bank (or the mini banks as some of the respondents called them). The new system did weaken the control the rich and the powerful in the village had on the institution but it also alienated the rest. Bureaucratisation not only led to depoliticisation and corruption but also discouraged participation of those it was supposed to serve.

Notes

1. For example, see RBI Reports, 1954, 1969, Thorner, 1964, Hunter, 1969, Frankel, 1971, Herring, 1977; Nilkant and Das, 1979, Roth, 1983, Oommen, 1984, Joshi, 1985.
2. This paper is a part of a broader study of agrarian change and debt dependencies in Haryana agriculture. Field work for the study was conducted in three medium size villages of an agriculturally developed district (Karnal) of Haryana. The field work was carried out during 1988-89 over a period of six months. Apart from observations and interviews with various people, 185 case studies of farmers and labourers representing different categories were conducted (see Jodhka 1990).
3. The PACS I was registered in 1953 and the PACS II and PACS III started in 1952.
4. For PACS 'non-agriculturists' are those villagers who do not own and cultivate land. The category includes landless labourers, petty-shopkeepers and village artisans.

5. A cultivating farmer who owned up to seven acres of land was considered a 'small farmer' and those owning more than seven acres were considered 'big farmers'.
6. For a loan up to Rs 5,000, the interest charged was 11.5 per cent. For loans between Rs 5,000 and Rs 10,000, it was 12.5 per cent and on the loans above Rs 10,000 the interest was 13 per cent. The interest rate for consumption loans was higher (15 per cent).
7. Jats and Rors are the local landowning dominant castes. In village II and village III almost all the big landowners came from these categories.
8. For debt dependencies of agricultural labourers, see Jodhka, 1994.
9. Information provided by the three secretaries of the PACS. This is particularly significant in light of the fact that the recovery of the agricultural loans advanced by commercial banks was as low as 42 to 45 per cent.
10. After Devi Lal came to power, some loans were waived but only those ones which were taken before March 23, 1986, were not 'dead loans' ('non-defaulting members') and the money was still outstanding on June 30, 1987. A principal amount of Rs 37,000 and interest worth Rs 14,000 was waived in the PACS II. Out of this, an amount of Rs 2,800 was principal amount of non-agriculturists and rest was that of the farmers. In PACS III, Rs 12,700 of principal amount and Rs 6,000 of the interest was waived. Only one non-agriculturist benefited. His outstanding loan of Rs 500 was waived. In case of the PACS I, Rs 15,600 and Rs 8,500 was written off.

Democracy and the Fight against Communalism

K Balagopal

THIS is a belated response to Sumanta Banerjee's 'Sangh Parivar and Democratic Rights' (*EPW*, August 21, 1993). Belated, but certainly not too late, for the issue he has raised is one that we are living with, and will continue to live with for a long time to come. And the attitudes he adopts are part of the legacy of the left that needs to be critically re-thought.

Banerjee's suggestion that the left and secular forces should be prepared to take on the Hindutva forces physically cannot be faulted, if by that he means that they should be prepared to face force with force in defence of the existence and the rights of the Muslims or other likely targets of the Hindu communalists, such as for instance the dalit communities. If this is all he means, his complaint that the secular forces are hesitant to take the plunge and are seeking tame refuge in issuing pamphlets and holding seminars is a valid complaint too. Though one is sure he does not object to the issuing of pamphlets and the holding of seminars as such.

But Banerjee's complaint and argument do not stop there. Alleging fairly enough that "the left parties have betrayed an unwillingness to engage unhesitatingly in confronting the politico-religious configuration of Hindutva and throw the power of their organised working class base behind such a confrontation", and citing the example of the heroic or tragic efforts of the German and Italian communists of the 1930s, he adds that the left parties justify their merita by chanting the old principle ("now reduced to an almost anachronistic mantra") that "communalism should be fought ideologically and politically, instead of by administrative measures". Let us ignore for a moment whether the organised or other working class is itself interested in being 'thrown' into the confrontation with communalism (for it is always assumed that the working class is ready for all such progressive tasks, and only the leadership is at fault). What is striking in his argument is that he begins with the working class as the possible but neglected battering ram against communalism, and ends with 'administrative measures' as the force needlessly despised by the left. This is not an isolated slip in his argument. Throughout his argument against 'democratic tolerance' towards the Hindu communalists, Sumanta Banerjee is quite ambiguous on the question: whose tolerance is he talking about? That of the democratic forces, or that of the institutions of the Indian state and the political process called the government of

India? It is precisely because Sumanta Banerjee, given his long involvement in civil rights work, cannot be accused of a light-hearted attitude towards democracy and democratic rights, that this ambiguity needs to be discussed.

The Sangh parivar does not believe in democracy, nor in the democratic values expressed in the Indian Constitution. The more it grows, the more it will destroy those values. And so to show the Sangh parivar democratic tolerance is to wantonly destroy democracy. The preservation of democracy and the protection of the lives of the thousands of individuals who are likely to be sacrificed for the rise of the parivar are much more important than the democratic rights of the unholy parivar. This is the crux of Banerjee's argument.

THE DILEMMA

There is no denying that there is a dilemma here. But let us look at all that is involved here - all the elements of the dilemma - before we come to a conclusion. The denial of democratic rights such as for instance the rights of free speech and assembly to any individual or group in society does not only destroy the chances of that individual or group to grow and dominate society. It simultaneously destroys the values expressed by the rights denied, and the institutions responsible for guaranteeing those rights. These values and institutions may be termed 'bourgeois' (I am not imputing this terminology to Sumanta Banerjee) if their historical origin and philosophical expression is traced to the anti-feudal democratic revolutions of Europe which resulted in the domination of capital over society. For the reason of that historical origin the specific meaning and institutional form of the rights do also carry bourgeois limitations. Nevertheless each such right expresses a value that is as much a lasting resource of human civilisation as the steam engine that Marx was immensely impressed by, and each of the institutions evolved by bourgeois society for the implementation of the rights (a professional and independent judiciary, for instance) embodies principles that need to be carried forward while the structural and conceptual limitations of the institutions (such as the equation of total alienation from society with judicial impartiality) are criticised and overcome. Every contemporary civil liberties struggle must strive and does strive not only to protect a given right in a given context (the right of a prisoner against torture, or of slum-dwellers against eviction)

but also the democratic values and institutional principles relating to that right, while critically overcoming the bourgeois expression of the notions and forms in which the principles are embodied, and the institutions in which their realisation is enshrined. This is a complex task that can never be reduced to a black and white 'class character' of rights (such as that bourgeois democracy is honeyed poison, with accent on the poison, or that it is more of a poison because it is honeyed, with accent on the honey), though the class character does enter the definition, conceptualisation and institutionalisation of the rights.

This preface is not intended to imply that Sumanta Banerjee has expressed himself in these terms, it is however necessary to state these ideas in black and white to realise the full implication of Banerjee's argument. He recognises the crudeness of these implications when he posits an argument his critics may offer, if the police are allowed to behave unlawfully with the Sangh parivar they are likely to behave in the same fashion with others. He does not really answer this argument, probably because he does not regard it worthwhile to do so. Yet, one only has to listen to complaints about police misbehaviour in post-Gill Punjab to realise how serious the consequences of wilful erosion of legality in police behaviour can be. (We had a taste of it when some companies of commandos from Punjab were posted in Karimnagar to thwart the Peoples War's bid to forcefully obstruct the election process: the commandos struck terror among women by behaving like privileged studs in heat.) In Andhra Pradesh, policemen who have done a stint in the naxalite affected areas are taking to such lawless behaviour wherever they are posted in the state that the 'public opinion' that condoned police excesses in Telangana because it felt the naxalites did not deserve democratic rights is now rueing its attitude.

But this is only the crudest, and therefore the most easily recognised, implication of his argument. For instance, he also criticises the judiciary for allowing 'democratic space' to the Sangh parivar by merely doing its duty as understood by the judges concerned: for striking down the ban order on a BJP rally in Calcutta, for ordering the Orissa administration to reopen the locked VHP office; for striking down the ban on the RSS and the Bajrang Dal; and for allowing the installation of Ramlalla idols at the site of the demolished masjid. Some of these orders of the courts can be faulted for a lack of judicial impartiality in interpreting facts and the law. Such a criticism is even politically very necessary for it points to the growth of a shamelessly pro-Hindutva outlook in the judiciary and the administration, to the detriment of the values of secularism and the evenhanded interpretation of law. But

such is not Sumanta Banerjee's criticism. He is against the granting of 'democratic space' to the Sangh parivar by the courts irrespective of how judicially correct the orders are. His argument is that because the Sangh parivar is a fascist force, it should not be allowed any democratic space by the courts, quite irrespective of the legal merits of the case. How much harm this can do to the Sangh parivar one does not know, but it will certainly do immense harm to the courts as an institution of democracy – of bourgeois democracy, yes, but as we have said above, that is not an uncomplicated description.

When we move from the judiciary to the armed executive, the plea for greater intolerance towards the fascists becomes positively dangerous. Sumanta Banerjee is allowed to lay down – and legitimise in the name of democratic rights – the principle that fascists do not deserve democracy. But he will not be the one to determine who the fascists are when the time of determination comes. He is careful enough to argue that his contention will not apply (if he can help it) to the naxalites and other radical forces, who too indulge in unconstitutional acts, because their goal is the constitutional goal of socialism, and the democratic goal of upliftment of the oppressed. This is both irrelevant and arguable. It is irrelevant because once 'the left, the liberal intellectuals and the human rights groups' endorse the view that the Indian state need not extend democratic tolerance to fascists because such tolerance will result in the growth of fascism and the throttling of democracy, they are not going to be consulted about whom the Indian state will define as fascists. In his rhetoric, Sumanta Banerjee has already included the 'Punjab and Kashmir terrorists' in the list of the damned with whom the Hindu communalists are to be treated on par and denied democratic rights. Though his prose leaves room for the unhappy supposition that in his view democratic rights groups should only oppose the torture and killing of 'non-involved persons' by the security forces in situations such as Punjab and Kashmir and not of persons who are actually involved in the militancy, I will take it that he intends it only as a rhetorical statement: when the Punjab and Kashmir militants are denied rights on the ground that their arms are unconstitutional and their politics communal, why should not the same apply to the Sangh parivar? The Indian state will be only too glad to use the licence Sumanta Banerjee offers in reverse. Not only the Punjab and Kashmir militants but also the Naga, Mizo and other north-east militants too have arms that are unconstitutional, and some of them at least will probably not ensure the rights of minorities in their regions once they succeed (and in that sense are communal). And yet it is precisely the civil liberties groups that have consistently argued that behind the secessionism and sectarianism of these movements there is a historical legacy and a social reality that need to be tackled at the level of argument and

persuasion and not with guns; that the people who support these movements should be won over if that is at all possible, and not terrorised; that even militants caught red-handed should not be executed extra-judicially but should be tried in a court of law; and that at the end if it is not possible to prevent secession by persuasion, then they should be allowed to secede. This point of view, which was first expressed by a handful of civil liberties groups in the teeth of universal condemnation has now been grudgingly accepted as a legitimate viewpoint that has to be acknowledged and accommodated, howsoever unwillingly. The criterion whether the goals of a political movement are constitutional or not, which Sumanta Banerjee introduces quite arbitrarily to distinguish the radical forces from the Sangh parivar, can be a dangerous one. A political group may honestly want to effect changes which are not visualised by the Constitution, and may take to arms to that end. It would be suicidal for the notion of one's democratic right to espouse politics of one's choice if on that ground civil rights groups allow the state the discretion to deny them the very right to exist politically, that is, to enjoy the right of free speech, peaceful assembly and a fair trial if arrested on charges of violence.

Sumanta Banerjee, of course, has a more solid criterion than constitutionality. This is whether a movement is faithful to the ideals of social, political and economic democracy. He would argue that those who indulge in violence towards ends which are violative of those ideals do not deserve democratic rights. But again, the question arises who is to judge in case of doubt, for doubt there will always be. Most of the minority-nationalities movements in India can be faulted with espousing ethnic self-determination (an element of political democracy) without committing themselves to a democratic form of political life after 'liberation', and also often at the cost of social regression. The communists too can be fairly accused of espousing economic and social democracy at the cost of political authoritarianism. And so on. Indeed, anyone who wants to seriously dispute Sumanta Banerjee's argument that the naxalites can be allowed democratic rights for their goal is the constitutional goal of socialism may well argue (as the more intellectual among police officers are already arguing) that all that the communist revolutions have achieved in this century is the discovery of a rather crude and ungainly road to capitalism – or rather, neocolonial subordination – which state India has any way reached by a more civilised route, and therefore there is no reason why the naxalites should be allowed the freedom to take a lot of lives and impose upon this country an authoritarian government. This argument can no doubt be disputed by exhibiting the material and cultural advancement of poor people's lives under communist regimes, but it is the Indian state and not some well-meaning democrat

that one will be trying to convince. And it would be dangerous for the naxalites and other radical forces if their democratic right to exist politically is predicated on the possibility of proving to the satisfaction of the Indian state that the trade-off between political authoritarianism and material well-being in the erstwhile communist bloc countries has been positive at the end of it all.

Democracy can only be indivisible because in this imperfect world of imperfect human beings and their imperfect politics there can be no dividing line that will ensure by mere logic that all those who deserve democracy will get it, and those who do not will not. It is quite likely, on the contrary, that once such a line is drawn and approved by 'the left, the liberal intellectuals and human rights groups', it is those who do not deserve it that will get it, and it is those who deserve democracy that will get pushed out, for it is not those who have drawn the line that will decide its application, but the likes of P V Narasimha Rao.

But what will definitely happen in the course of this effort is that the notion that the state has the prerogative of deciding who has the right to exist politically and who does not have that right gets legitimised, and that is to the detriment of all that we understand by democracy. If religious fundamentalism can be a basis for fascism, so can state authority if allowed to take arbitrary forms. To call for strengthening the latter to fight the former can be suicidal. In more immediate terms, there is nothing that P V Narasimha Rao would like more than to have the liberal intellectuals and the civil liberties groups egging him on to 'ruthlessly suppress by coercive measures' the Hindutva forces, for when he decides to get tough with them he has all the democratic forces behind him, and when he decides to be indulgent towards them, he is more democratic than all the democrats in the land. It would just suit his kind of unprincipled and opportunist manipulation that is read as ambivalence by some, pragmatism by others, and the quintessential broad-mindedness of an ancient civilisation by the rest.

WINNING OVER PEOPLE

But it is necessary to go deeper into the matter. A discussion of some of the assumptions that lie behind Sumanta Banerjee's argument is necessary, quite apart from the problem of Hindu communalism. Sumanta Banerjee recognises that the ideological battle against Hindu communalism should enable us "to reconquer space in the democratic arena in favour of the anti-communal forces". One would imagine this is the essence of the matter. This space that is to be reconquered is not out there somewhere in society, but in the minds of the people, in the social consciousness of the era. And therefore what he is saying is the same as winning over people to the secular and democratic world view. How is this to be done? Why would or should people be attracted to the secular and democratic

view of life? What is it that prevents people from getting attracted to it? Sumanta Banerjee says at one point that a democratic and peaceful debate with Hindutva is not possible when people are all terrorised or partisan, and rendered somnolent by the bulldozing of Hindutva. Let us admit that more people are partisan than are terrorised, and that what is an opium-induced somnolence for you is conviction born of faith for me. And it is these convinced partisans that are to be won over, or at least made to realise that their ideas will not be allowed the legitimacy that every idea requires to become socially effective. Is that to be done by banning the propagation of the ideas they are convinced of? Certainly, the least likely way of changing people's views is to start by banning the expression of the views to be changed.

In any case, the politics of Hindutva is based on a political and tendentious elaboration of the day-to-day culture of brahminical Hinduism, and while the Viswa Hindu Parishad can be banned, neither this culture nor its myriad organisations can be banned. Can the Indian state place a ban on the Ganesh Utsav Committees and the Dassara Pooja Mandalis? Can it ban the Shankaracharyas and the smaller fry among the brahmin preachers from carrying on Hindutva propaganda? Can it ban the newly created Dharmasansads that are issuing ultimatums to the two brahmins sitting at the top of the Indian state? Can it ban the responsive chord that their dicta strike in the hearts of the two brahmins?

Assuming that it can or will do this (which is to assume the impossible), will it win democratic space for the anti-communal forces? All the erstwhile socialist countries reasoned exactly thus, not only about ideas of religious fanaticism, but all ideas unpalatable to socialism. They only succeeded in creating for themselves the illusion that all reactionary ideas had died out and the 'new man' was born. It only required the removing of the lid to disclose that not a single reactionary idea had died out. And for having been suppressed ruthlessly, religious and ethnic chauvinism have burst out with a maniacal passion unknown in countries which believed that however unpalatable and pusillanimous it may seem, political and ideological freedom is indivisible.

We do not yet know fully what it is in human beings that keeps ethnic, religious or communal violence alive as political passions, and have been content with explanations of why such violence is espoused by whom in a given setting (which is about all that Marxism as popularly understood can tell us); but certainly, the ruthless suppression that Sumanta Banerjee advocates is no way to save ourselves from the cancer. We can on the other hand try to convince the oppressed and exploited classes, castes and other social groups that Hindutva is contrary to their material and cultural interests; we can work for organising such people to resist the forces of Hindutva

physically if necessary; and we can try to appeal to the democratic, humanist and anti-authoritarian values that all human societies possess side by side with values of domination and suppression. The first of the three tasks has been attempted on a sizeable (if still inadequate) scale by the left parties, the dalit groups and other democratic organisations. The second is yet to be attempted on a significant scale, as Sumanta Banerjee rightly complains. But the third is a vital task whose necessity is insufficiently understood by progressive forces because it is not adequately comprehended by radical political philosophies, including Marxism which is the most comprehensive of them all. So long as the fanatical chauvinism of Hindutva is not consciously rejected as a value, or rather as a value-complex that forms part of society's culture and shapes human ideas and behaviour, it will not be fully defeated, and even if it is defeated in one form, it can re-emerge in ever new forms, whether or not related to Hinduism (History is witness to innumerable instances where those who have fought an authoritarianism that oppressed them have themselves turned authoritarian thereafter, for what they have fought is not oppression *as such* but the oppression of the Other that has hurt their interests.)

And it is in view of this need of rejecting Hindu fanaticism as a value-system that the call for an end to democratic tolerance needs to be rejected, for such a prescription allows religious or ethnic fanaticism no content of its own but only the role of an instrumentality in protecting a material interest. Hindutva, on the contrary, is not only that but over and above that it is a set of values, attitudes and norms of behaviour that can only be countered with the aid of alternative values and norms. And this task must necessarily be undertaken by an open and equal debate that calls upon the historically evolved human sense of justice, equity and fairness. Such a debate can never be conducted, and can never win minds and open up democratic space, if one party to the debate is suppressed by being denied freedom of expression. Of all arguments, an argument for justice unfairly conducted can never win approval, even if it is entirely logical and scientific. That would be contrary to the human moral sense.

The alternative values and norms can emerge from struggles against Hindu fanaticism; or rather, they can be recalled through the struggles from the moral storehouse of the human species, itself a historically evolved and contradiction-ridden product of human civilisation. This process of emergence of new values from struggles is not as straightforward a process as it seems in the midst of struggles, but is an intricate pattern of generalisation, consolidation and recovery. A proper understanding of this process requires a more thorough understanding of the moral life of the human species than is revealed by the base-superstructure determinism and the concomitant presumption that social consciousness can be fully

classified in a one to one fashion in terms of the 'base' determinants such as class or caste.

This moral life of the human species is something that it has cultivated as elaborately as its technical skills, and conjointly with it. Any oppressive social structure or practice such as for instance the fanaticism of the majority reflected in Hindu chauvinism gains support by appealing to what is violent, destructive and anti-human in human moral life. Democratic tolerance and the acceptance of social equality as a principle, which are central values of secularism in the Indian context, appeal to the sense of justice that human cultures equally possess. These moral possibilities are intrinsic to human beings as much as they are a product of history, in the sense that they are a historically determined elaboration of innate human potential expressed in spontaneous qualities such as empathy, satiety, revulsion, fear, etc. that are universal to human beings.

In understanding the moral life of the human species, Marx's dictum that Being determines Consciousness must be understood with reference to the specific nature and structure of *human* consciousness and *human* psychology. Social being determines social consciousness by virtue of and through the specific form in which human consciousness is structured. It is easily demonstrable that humane ideals such as equality and justice are born of resistance to conditions of injustice and inequality, whereas inhuman values are born of oppressive social relations, and social practices structured oppressively. But that is not the whole of the matter. Firstly, the values and the norms are the ideal form of expression of immediate needs, interests and aspirations, whether narrow or broad; it is a characteristic of the structure of human consciousness that immediate interests and aspirations – whether just or unjust, whether of the oppressors or the oppressed – get expressed in terms of universal values, ideals and moral precepts. This generalised expression is not necessarily a fraud perpetrated consciously for hegemonic social purposes; nor is the generalised ideal co-equal with the immediate interest or aspiration, an assumption that enters all glorification of the 'class consciousness' of the oppressed. It is on the contrary just what it is: a characteristic feature of the structure of human consciousness, of the nature of human thought, which cannot conceive of immediate interests except in terms of universal values, just as in general it cannot think of the concrete without the aid of abstractions.

And secondly, this universal value in which a particular interest is expressed, or through which a particular life condition is conceptualised, is capable of surviving the particular situation (indeed that is when we realise that it is not co-equal with, nor a fraudulent generalisation of, the particular interest), of abstracting itself from the particular context, and becoming part of the 'common sense' of that society, attaching itself to this and that situation, and acquiring

this and that meaning at later stages. There is thus a continuous process of generation, definition and specification of ethical norms, values and precepts that arise in and are generalised from specific life situations and struggles, which process creates the moral content of social culture which is institutionalised in civil society in the manner described by Gramsci and others, and which in turn shapes human behaviour in society through the kind of conflict typified (though certainly not fully explained) by the Freudian conflict between the Id and the Superego. The ensemble of the values and ethical principles that have accumulated in the history of any society is a very complex structure of norms that carry historically specific meanings and interpretations attached to moral absolutes such as truth, kindness, love etc. A critical attitude towards this moral universe in which one rejects the inhumanity that hides behind high morality and continuously calls forth the humanism that co-exists with it, ought to be an important part of radical political practice.

NEED FOR A FRESH LOOK

All this has a bearing on the need to take a fresh look at familiar Marxist positions, of which Sumanta Banerjee's is but one example. The fight against Hindutva, or against authoritarianism and fascism in general, is not just a defensive struggle to protect democratic rights and values. It is part of the struggle for restructuring human existence on a higher plane. The whole question of this restructuring needs to be rethought afresh, now that the total failure of the communist project – the attempt to put Marx's ideas into practice – is evident. The proletariat has nowhere exhibited the desire imputed to it by Marx to take charge of the affairs of humanity and rebuild its existence on the basis of communist collectivism. And the communist parties that substituted themselves for the proletariat have made a mess of the job, at enormous cost, whichever way they tried, the Stalinist way, the Maoist way, the Titoist way, and even the Sandinista way.

The basics of Marx's prognosis of the future therefore need to be rethought, and hence also the basics of his theory of history. Marxism, as well as other radical and progressive political philosophies, have rightly stressed the necessity of organised struggle against unjust social structures as the only way of defeating them, for mere moral preaching will never put an end to injustice. But the rebuilding of human existence in the form of just structures and on the basis of just social relations is a different matter. This rebuilding has wrongly been seen as a direct continuation of the struggle against injustice. This notion that the force that is necessary to destroy unjust social structures will by itself lead to the reconstruction of society on a just basis through the class rule of the oppressed has been sufficiently proved an illusion by the happenings of this century. Struggle against

oppressive social structures, and the reconstruction of society on the basis of co-operative and egalitarian relations, are evidently linked not through the *dictatorship of the last victors*, but through the *cultural possibilities opened up by the successive struggles*, and there is no last struggle, nor a millennial victory. To understand this, we need a more complete understanding of human consciousness, culture, forms of social behaviour, and the mode of formation of the human personality through the struggle between the universal psychic substratum of human nature and the particular norms of contradiction-ridden social culture, than even a Gramsci ever attempted. (Mao's notion of cultural revolution is politically inspiring but philosophically it goes no farther: than is allowed by the base-superstructure framework.)

The elaboration of its technical capabilities by the human species in its struggle to win a livelihood from nature has been given a central place by Marx in the notion of human progress. This elaboration is based on the specific physical structure of human beings, such as the possession of two hands to work with, and a brain capable of an elaborate learning process. But equally, human progress has involved the elaboration of moral values conducive to a co-operative, collective appropriation of the wealth created by the hands and the brain, which values have been elaborated in a struggle against anti-social values (also generated in the course of the same history) of oppression, domination and violence. This moral evolution is a historical process of elaboration of moral possibilities implied by the specific psychic structure of human beings, a structure that makes both anti-social and social responses intrinsically possible. What human beings have done for themselves with their physical possibilities is made the thread of human history and therefore also the thread of human liberation (for in Marx's understanding, liberation is immanent to history) by Marx. This has given us valuable insights into our past and valuable guidelines for our future. But this understanding is incomplete without supplementing it with an understanding of what human beings have done for themselves with their moral potential, and what future that indicates for the species.

Marx certainly did not 'ignore' the moral history of humankind, but for him this moral history has no parameters of its own but is a derivative of the material history. This is evidently not true. The human species possesses moral as well as physical possibilities – based on its psychic and physical structures – both of which it has elaborated conjointly in the course of its struggle to satisfy its (constantly elaborated) needs. The one is not a derivative of the other. The two are two limbs of the process of conjoint realisation of the total potential of the species on the basis of a given framework of its physical and psychological needs and responses. The physical structure

is the starting point for its technological evolution, and the psychic structure the starting point of its moral evolution, both of which are part of a single process. That the potential of human material development is not unlimited and unbounded as is sometimes implied, in Marx has been well brought out by the ecology movement. Human moral potential is also equally not an unlimited and unbounded one, as imagined in the wilder of Marx's ideas about communism. What we require today is a reinterpretation of all that is true in Marx's theory of history and society from the point of view of the totality of the human subject, the totality of its given humanness, physical as well as psychic, rather than the human subject reduced to an intelligent and acquisitive tooling animal, whose moral possibilities are rendered infinite and irrelevant for political practice by being simply ignored theoretically.

The future revealed by such a reinterpretation may not look particularly rosy right now, and one cannot be denied one's rightful pessimism about any millennium, for while human beings are universally capable of both violence and love, cruelty and generosity, it is violence and cruelty that have constituted the fundamental organising principles of all social structures (e.g., property, caste, family) in all civilised human societies till now, whereas the human capacity for empathy, love and kindness has been subordinated to these violent structures (often in a cruelly distorted form). The only reason for not totally rejecting Marx's utopia is that while all people at all times have indulged in hatred, violence and falsehood, not merely as personal aberrations but as fundamental structural practices, there is no human society that has accepted these modes of behaviour as morally noble. On the contrary, only love, kindness and truth have been accorded that honour in all societies. The anti-social qualities have certainly been sanctioned morally and socially and even mandated as in brahminical dharma, but always in the name of higher values such as truth and equity. (Amartya Sen in his study of inequalities says that even those who defend inequality do so in the name of a higher equality.) Perhaps this paradox of human civilisation understood as a quality of its moral universe gives hope of the possibility of a 'co-operative commonwealth of the working people' (in which everyone does all work), provided that the struggle for appropriating the material wealth it has produced for and by the whole of the society rather than a fraction of it, is joined with a struggle to invert the moral universe of the species so that violence is subordinated in social structure and habitual practice to love and envy similarly to generosity.

But perhaps also not. In any case, if the millennium fails our practice must at least give us a reformed society, which is doubtful if we go on uncritically repeating old ideas and attitudes.

Ensure with Children's College and Career Fund

Investment in UTI's CCCF helps you meet mounting educational expenses, and to achieve your child's career dreams.

H I G H L I G H T S

- An open-ended scheme
- Scheme for children up to 15 years.
- Each unit of Rs 10, minimum investment of Rs 2000, and in multiples of Rs 1000 thereafter
- Growth of the fund will be credited to investors' accounts periodically in the form of bonus units
- Partial withdrawal allowed twice every year - 50% at 18 years' age, with an additional 10% every year up to age 23 years.
- Provision to nominate alternate child
- Bonus units against bonus dividend of 15% p.a. for the period ended 30/9/94 will be allotted to each member on pro-rata basis depending on the date of joining.

**CHILDREN'S COLLEGE
 AND CAREER FUND**
 UNIT PLAN-93
Because you owe it to your child.

 15% p.a.
 bonus dividend
 declared for the
 period ended
 on 30-09-94

GANESH BENZOPLAST LTD.

Registered Office: 145-A, Dr. Viegas Street, Bombay 400 002. Tel: 8382096/3097 Fax: 8391529

Public Issue of 36,72,800 14% Secured Fully Convertible Debentures comprising of 13,23,800 14% Secured Fully Convertible Debentures of Rs. 210/- each for cash at par and 23,49,000 14% Secured Fully Convertible Debentures of Rs. 210/- each for cash at a premium of Rs. 40/- per Debenture on Firm Allotment basis to Foreign Institutional Investors/Non Resident Indians, Indian Financial Institutions and Indian Mutual Funds, aggregating Rs. 8,652.48 lakhs.

HIGHLIGHTS

- 1 Established profit making Company paying dividend since 1987 being the first year of operation
- 2 Manufacturer and supplier of Benzoate Plasticizers, Benzoic Acid and Sodium Benzoate, an import substitute
- 3 Promoters with over 20 years of experience in chemical industry
- 4 Facilities for chemical storage having great demand
- 5 Sustained growth in profitability and network
- 6 Diversification into manufacture of Refined Iodised Salt and other marine based chemicals
- 7 No raw material required other than sea water for the diversification project
- 8 Expansion of capacity of Liquid Storage facilities from 70,000 KL to 2,35,000 KL at Jawaharlal Nehru Port, Nhava Sheva, near Bombay
- 9 Attractive Conversion terms for Debenture in two stages
 - One Equity Share of Rs. 10/- at a premium of Rs. 85/- on allotment of Debentures
 - One Equity Share of Rs. 10/- at a premium of Rs. 105/- at the end of 12 months from the date of allotment of Debentures
 as against current market price of Rs. 180/- (Ex-Rights as on 9.12.94)
- 10 Convenient terms of Payment Rs. 80/- on application and Rs. 130/- on allotment
- 11 Easy Liquidity - Listing at Bombay, Ahmedabad, Delhi, Calcutta, Ludhiana, Madras, Jaipur and Cochin Stock Exchanges

RISK FACTORS

Internal to the Company

- 1 The Company is yet to obtain pollution control clearance for salt project
- 2 The demand for storage space at bulk liquid terminal is dependent on the import/export of liquid chemical cargo through Jawaharlal Nehru Port. The Company is yet to obtain environmental clearance and requisite certificate under Explosives Act for additional bulk storage facility at JNP, Nhava Sheva
- 3 The proposed project for manufacture of refined iodised salt is to be located on leasehold land of United Salt Work Industries Limited (USWIL), a Company referred to BIFR for rehabilitation. Raw Salt, the basic raw material for the Iodised Salt Project is also proposed to be procured from salt pans owned by USWIL. The promoters of Ganesh Group have submitted a proposal to Bank of India, the operating agency for acquisition and revival of USWIL, who will be submitting the proposal to BIFR for final decision. Any delay/adverse decision of BIFR, will affect the implementation of the salt project
- 4 The data on annual requirements and production of iodised salt are based on the Company's own estimates
- 5 Ganesh Anhydride Limited (GAL), a Group Company, has overdues to institutions/banks to the extent of Rs. 1,175.51 lakhs as on 31.03.94
- 6 The Company is yet to obtain sanction for power for the proposed projects
- 7 The Company is yet to place orders for major plant & machinery for the salt project
- 8 There has been a delay of 8 weeks in despatch of Refund Orders/Share Certificates by GAL in respect of their previous issue
- 9 There has been delay in despatch of Refund Orders/Share Certificates in respect of Rights Issue of 1991 and 1994 and in listing of Securities of the Company on some of the Stock Exchanges in respect of their previous issue made in January, 1994
- 10 The commercial production for manufacture of Benzoic Acid and Sodium Benzoate which was estimated to commence from June 1992 as per Letter of Offer for Rights Issue made in 1991, actually commenced in February, 1993

External to the Company

- 11 The massive expansion of Chemical Storage facilities is proposed in view of the emerging demand on account of bulk imports/exports of liquid chemicals following liberalised trade policy of the Government of India. Any

changes in this policy could adversely affect the potential demand

- 12 The Company consumes imported raw materials for its existing business of manufacture of Benzoate Plasticizers. Any adverse fluctuations in foreign exchange rate will have a bearing on the profitability of the Company

MANAGEMENT PERCEPTION OF THE RISK FACTORS

Internal to the Company

- 1 The projects do not generate any effluents and therefore the Company does not expect any problem in obtaining pollution control clearances
- 2 The liberalised trade policies of the Government of India have substantially increased the potential demand for storage facilities and this demand is expected to go up further. Indian ports are presently short of storage space as compared to storage space in international ports and storage facilities as proposed by the Company will result in substantial savings to the economy owing to better price on bulk imports and faster turnover of steamers at ports. The Company does not anticipate any difficulty in obtaining environmental clearance and requisite certificate under the Explosives Act

3 The proposal submitted by the promoters of Ganesh Group for acquisition and revival of USWIL has been favourably received by Bank of India, which is the operating agency. A payment of Rs. 50 lakhs as directed by BIFR has already been deposited with Bank of India. A favourable decision of BIFR is expected soon. Besides, the Company has approached the Government of Gujarat and Kandla Port Trust for allotment of land near salt pans at Kandla. As such the implementation of the iodised salt project is not expected to be affected. Also, the coastal belt of Kandla is one of the largest salt producing areas in the country and the Company can procure raw salt from other salt pans in the area without any difficulty. For the purpose of profitability projections, the cost of raw salt has been assumed at current market price

4 The Company's estimates are based on detailed study of the salt industry conducted by its internal project team

5 On account of depression in international prices of Maleic Anhydride, GAL had suffered losses. However, it is currently making cash profits and has submitted a rescheduling proposal to the institutions which are awaiting their approval

6 The Company does not anticipate any problem in obtaining the requisite permission for the power

7 Orders for pumps, valves, cables, weighbridges etc. have already been placed. The Company has shortlisted the machinery suppliers for other major equipments and the orders will be placed within the time schedule envisaged

8 The delay was caused by certain disturbances in various parts of the country. However, most of the investor complaints have been redressed

9 The securities were listed on the regional stock exchange within the prescribed time limit. However, there was some delay in listing of securities of the Company on other stock exchanges in respect of the previous issue made in January 1994

- 10 Owing to delay in installation and fabrication of certain critical machineries, there was a delay. However, in respect of issue made in 1994 the Company has fulfilled its promises in respect of project implementation and financial projections

External to the Company

- 11 The commitment of the Government towards liberalised international trade is further reinforced by the signing of GATT agreement. Hence, the Company does not expect any reversal of the liberalised trade policy
- 12 The Company has been increasing its thrust on exports of its existing products. Also there is substantial scope for export of iodised salt. Hence, any adverse fluctuation in foreign exchange rate will be offset by increased export earnings

Investors are advised to refer to the para on 'Justification of Premium' mentioned in the offer document before making an investment in this issue

Vol XXX No 2

January 14, 1995

Not By Privatisation

A careful examination of the case for privatising the railways in India, using the framework of the theory of contestability, leads to the conclusion that, considering the social burdens the railways have been required to carry, the gains in productive efficiency accruing to the railways from privatisation will be more than outweighed by the losses of allocative efficiency and other non-commercial benefits which the country has enjoyed from the historical role the railways have played in its socio-economic development.

103

Curio Case Model

The economic reforms being undertaken almost throughout the developing world today are guided by rules-of-thumb and the general equilibrium model of the economy to which these standard rules apply is an unrealistic portrayal of most developing economies. The model holds good only under very restrictive assumptions and only for small economies and not large ones such as India's.

113

Political Thaw

The assembly elections in Andhra Pradesh and Karnataka have brought out some significant shifts in the alignment of political forces. The immobilism which has marked the Indian political scene may be coming to an end.

81

Second Thoughts

Developments in the money markets last month were notable for the about-turn by the Reserve Bank which injected Rs 2,000-2,500 crore into the market, going against the earlier objective of contracting primary liquidity and containing money supply growth.

73

Reverse Scholarship

Countries pursue their own interests the way they perceive them and it is for others not to be deceived by the rhetoric. To understand the interests that are masquerading as values, what is required is a detailed study of the economy, polity and culture of the western world in general and the US in particular, for these are the main protagonists in the contemporary scene without understanding whom we cannot shape our own policies to meet their strategies.

93

All in Our Genes

The ideological shift to the right in the US is being underpinned by certain trends in the social sciences and their popular dissemination. Two recent publications exemplify this.

87

Unpretty Record

The CBI report on the infamous Muzaffarnagar incident has put new life into the Uttarakhand movement - at a time when the Mulayam Singh government's record in its first year in office has come in for sharp criticism from all quarters.

82

In Decline

The process of disempowerment of the bureaucracy which is supposed to have begun with the erosion of the 'licence-permit raj' has to be located in the complexities of the relationship among class, bureaucracy and state power.

119

Issue Evaded

Although the plan of action approved at the Cairo conference on population and development shows the influence of the international women's movement and the issues it has raised, it fails to tackle the crucial question of inequitable development between the north and the south.

88

Caste Balance

Deve Gowda, the new Janata Dal chief minister of Karnataka, is a leader with a mass base, but where he will find himself tested is as a political manager. The vokkaligas and the lingayats have established a hold over the party, but how long the accommodation between them will last remains to be seen.

84

LETTERS TO EDITOR

M Shatrugna

SATYASHODHAK – Centre for Social Research expresses its deep sense of shock and grief at the sudden and untimely demise of M Shatrugna on December 31, 1994. Cheerful and lively, Shatrugna was suffering from liver cancer which was detected to be in an advanced stage only a few weeks before his death.

Shatrugna played an active and significant role in the AP teachers' and civil rights movements during the last three decades and was closely associated with the women and dalit-subaltern causes when they emerged as important questions in politico-ideological discourse from the 1980s onwards. He was one of those rare individuals who embodied the finer aspects of the left and democratic tradition. In his actions and speech one could clearly feel the qualities of frankness, tolerance and transparency.

When Satyashodhak was founded in 1992, Shatrugna was one of the few friends who encouraged us and showed a sustained interest in our activities – an instance of his readiness to appreciate new initiatives and openness to new modes of enquiry. It is difficult to believe that Shatrugna is no more with us.

Changing India

PLEASE forgive this tardy reply to G P Deshpande's review (September 24, 1994) of my book *Changing India* (Cambridge University Press, Cambridge, 1993). The review contains some factual errors which I would like to correct:

(1) The first part of my book *does not* deal with "...the history...of bourgeois revolution and change in India." That is the second part. The first deals with the basic social institutions of the Indian countryside.

(2) I *do not* "open...[my] discussion ...with ...caste" nor does caste occupy "the central place" in my discussion. I open my discussion with a long introductory chapter and then a chapter on families and villages. Of seven chapters, caste is the specific subject of one, the closely related subject

of another, on class, and the occasional subject of other chapters in Part I. In Part II, caste is barely mentioned.

(3) My discussion *does not* give the "impression" that I think the *varna dharma* to be of "Vedic times". I have no thoughts on the matter and imply none. My relevant sentence is, "...Hinduism is disinclined to search the historical past for validation, and the validity of *varna dharma* is not as a memory of the past but as a living ideology" (p 54).

(4) My summary sentences on sanskritisation are, "As it applies to village families nowadays, Srinivas' model [of sanskritisation and westernisation] is too dichotomous and too equating of sanskritisation with village upward mobility... Upwardly mobile village families are sanskritising and westernising: taking from both what serves them best" (p 68). Is this a 'cliche'?

Sydney

Raw Material Price Rise

INTERNATIONAL prices of key industrial raw materials have doubled or even tripled during 1994. Petrochemicals, newsprint, non-ferrous metals, metal scrap are touching record highs. Press reports suggest that the entry of finance capital into commodity markets is mainly responsible for this state of affairs.

Indian manufacturers have raised prices to match the import price without any justification in terms of cost economics. For example, aluminium price is linked to LME when both bauxite and power are available locally at the old rates. User industry is reeling under the impact of both international and local price rise. A number of small scale units have downed their shutters as they cannot absorb the hike in raw material cost.

The Indian government has, apparently, few options to manage the situation. It has already reduced the customs duties substantially under the liberalisation policy. In some cases, for example newsprint, the duty has been removed altogether. Physical regulation is out of fashion. The issue is also not on the agenda of the international regulators, namely, the World Bank, IMF and GATT.

We call upon readers to express their views, experiences and suggestions on the subject. Our intention is to prepare a report on the issue which will serve as a starting point for a larger debate. A copy of the report will be sent free to all contributors.

Moonis Raza

READING Moonis Raza's 'Indian Muslims in Their Homeland' (September 24, 1994) was a moving and poignant experience. He is as, many of us know, no more. His trajectory from a brilliant student at Aligarh (with late Sultan Niazi he was in the Indian students' debating team which went to England and made an impression) to joint general secretary of the underground Communist Party at Kanpur during B T Ranadive and 1949 railway strike terror days to university life and ultimately a career in Indian academic and bureaucratic life was typical of such a proportion of the Left youth of the 1940s. Of course, many others did much more heroic – and also much more unheroic – things.

What marks out Moonis Raza, something which shows so well through the *EPW* piece, is his outgoing forward-looking doggedness to stand up and fight for a secular, modern India – fair and egalitarian to the extent subordinate capitalist development will allow. So many of us, his friends from various quarters, would do so many things differently. But the forthright stand for a secular country and for a fair deal for its largest minority which he took as neither a complaining underdog nor a complacent apologist of the Indian state was characteristic of everything he did – some wrong but much right and effective.

S SHUKLA

New Delhi

A Tale of Two Countries

WHAT has gone wrong in Mexico is the question that people, not just in that country, but all over have been asking. Here is a country which until the other day was held up as a model of successful economic reform, including both liberalisation and privatisation, and was admitted to OECD, the club of the developed countries, in recognition of not just its fast economic growth over the past five years but also its high ranking with the international commercial banks through whom external credit flowed into the country directly and indirectly. Today Mexico's foreign exchange reserves stand drastically reduced from \$ 30 billion to \$ 5 billion, i.e., to a level less than one month's imports. The rate of exchange of the Mexican peso has declined sharply from three pesos to one US dollar to six pesos within days. The domestic inflation rate which was supposed to have been brought under control (it was hovering below 10 per cent per annum in 1994) is once again threatening to escalate to typically Latin American levels.

The answer to the question posed at the outset has to be sought in the sort of resource mobilisation Mexico resorted to in order to finance its economic growth. True, the country attracted sizeable foreign capital whose inflow enabled Mexico not only to finance domestic investment but also to build up its foreign exchange reserves. But the country's economy is in the doldrums precisely because of the composition of the inflow of foreign capital. The outstanding credit extended by the international banks to Mexico stood at over \$ 70 billion by mid-1994 and of this not less than \$ 30 billion (over 40 per cent) was short term. So is it a matter of much surprise if at the slightest indication of a possible weakness of the Mexican economy the country's exchange reserves declined so very sharply within days?

What has happened to Mexico could easily happen to any other country as well. In India the authorities lose no occasion to boast of the build-up of the country's foreign exchange reserves from around \$ 1 billion in mid-1991 to over \$ 19 billion by the close of 1994. But don't we have to remember at the same time how these exchange reserves have been built up? Direct foreign investment so far during these three and a half years does not add up to more than \$ 1 billion. The rest of the growth in reserves can be attributed to sources such as non-resident deposits, foreign portfolio investment and inflows through international banks – all sources of hot money which make a country's

payments position extremely vulnerable. The current crisis faced by Mexico demonstrates how things can go wrong and how quickly if a country depends too much on footloose sources of external finance.

It has become quite fashionable in our country to refer to China, its economic reforms, its ability to attract foreign capital in massive amounts, its industrial upsurge and its sustained high rate of economic growth – supposedly to drive home the point that only through liberalisation and massive inflows of capital can we hope to industrialise fast and get on to a high growth path. Not that China's experience is irrelevant in our context. But we have to be careful while drawing our lessons from that country's experience. To illustrate, how can we ignore the fact that the solid foundations of China's industrial upsurge and fast economic growth are laid in its sustained high rate of domestic saving? What attracts foreign capital, in its various forms, to China is its self-reliance in regard both to the domestic saving the economy generates and the continuously expanding export earnings. So it is not so much with a view to supplementing its domestic saving or export earnings that China has needed foreign capital as to induct technical know-how and thereby to speed up its modernisation. And that is why China has been able to choose and be selective in the import of foreign capital. China's strong bargaining position *vis-a-vis* foreign capital can be gauged from its net asset position in relation to international banks which, as many observers have noted, have increased their overall lending in Asia. Where China stands apart, however, is that even though the banks' outstanding credit to it is substantial, being as high as \$ 50 billion, it is more or less balanced by China's deposits with them. Indeed China has been and continues to be the largest gross depositor with the international banks, as the latest issue of the *Amex Bank Review* brings out. So when one compares China's foreign exchange reserves of \$ 30 billion with those of other countries, one has to bear in mind the relative net position in relation to the international banks and the other sources of capital inflow of the countries being thus compared. If today China faces no crisis in its external financial position in spite of the substantial outstanding credit extended by the international banks whereas Mexico is in deep trouble, it is because of the sound foundations of China's economic growth. What lessons we should draw from the experience of these two countries is clear enough.

ECONOMIC REFORM

Let Them Eat Prawns

PRAWNS produced by brackish water aquaculture have become the biggest component of seafood exports, accounting for 71 per cent of the total of Rs 1,335 crore projected in 1995-96. The trend in aquaculture is toward 'semi-intensive' cultivation on larger farms replacing small-scale farming with low yields. High profit levels and government incentives have encouraged a number of large corporations to enter this field, leading to haphazard development of aquaculture in the absence of adequate government guidelines. Shrimp farming is expected to cover an area of 1,00,000 hectares by the end of the Eighth Plan, producing one lakh tonnes of shrimp per year, as against a production of 63,000 tonnes from 82,500 hectares in 1993-94. The state with the largest area under aquaculture is West Bengal, followed by Kerala, other states engaged in prawn cultivation include Orissa, Andhra Pradesh, Karnataka, Maharashtra, and Tamil Nadu.

According to environmentalists, the social, economic and environmental costs of shrimp farming far outweigh its export earning capacity. Aquaculture is destructive of groundwater resources and agricultural land because of salination; waste from the farms pollutes the ocean and shoreline, leading to a decline in catch; and wild stocks at sea are depleted to stock shrimp farms, thereby destroying the livelihood of local fisherfolk. Although officially agricultural land is not allowed to be converted to shrimp aquaculture, fertile paddy lands are in fact being converted on a large scale due to the higher profitability of this activity.

The environmental and economic damage caused by shrimp farms has led to protest by local people in several affected areas. The farmers and fishermen in Quaid-e-Millath district in Tamil Nadu, for example, have called for a total ban on the aquaculture industry. Farmers there fear that uncontrolled development of shrimp farms may cause salination of the soil, forcing them to sell their lands. Farm labourers are agitated over the loss of employment opportunities; they say that shrimp farms provide little employment and that women are not employed at all (the industry claims that each hectare of shrimp farm can provide employment directly to two persons and indirectly to eight). The local fisherfolk are opposed because shrimp farms have come up too close to the seashore, and the inlet and outlet pipes obstruct their movement along the beach and entangle their nets. The shrimp farms also have caused salination of the groundwater, so that the women have to

walk for long distances to find fresh water. The agitation against shrimp farming in this district resulted in tension and violence; according to a PUCL fact-finding team, last August supporters of prawn farms burned down 40 dwellings of landless labourers and tortured and detained activists opposing the farms.

In spite of local opposition, various states are going ahead with promotion of this foreign exchange earning activity. The government of West Bengal wants to make the state a major prawn exporter, and it expects an investment of over Rs 5,000 crore over the next five years. It has begun identifying one lakh hectares of land suitable for exclusive prawn farming, to be leased to private sector investors for setting up 'semi-intensive' farms. Hindustan Lever has already invested in prawn farms on a large scale in the state, and other companies, including IFB Agro, ITC Agro, Lakhotas, and Andrew Yule, are setting up farms and high-technology processing plants, some with foreign technical collaboration or World Bank aid. The West Bengal government is setting up a large hatcheries project with assistance from the World Bank, from which, not surprisingly, much of the support to aquaculture development is coming. The Aquaculture Foundation of India, which was founded recently to promote the 'blue revolution', plans to establish at least three 'technology development centres', each costing two to three crore rupees, for which the World Bank has agreed to give interest-free loans of up to 80 per cent.

An expert committee appointed in the wake of the controversy in Tamil Nadu has made several sensible recommendations for the regulation of aquaculture, but it remains to be seen whether the state and central governments have the will to formulate and enforce rules protecting the ecology and economy of the coastal areas if such rules contravene the imperatives of export-oriented 'development'. Shrimp aquaculture is a highly wasteful and inefficient technology which feeds the markets of foreign countries while depriving local people of their livelihood, food and drinking water. The results of its uncontrolled development are already being seen in Andhra Pradesh, where shrimp production has been halted on 32,000 hectares by a deadly virus, causing a loss of over Rs 400 crore. Investigators attribute this outbreak to the indiscriminate use of biochemicals and antibiotics and to the unscientific farming practices which have been followed by large corporations as much as by small farmers. Still, the policy of the government, in its quest for the holy grail of foreign exchange, seems to be to

sacrifice equitable and sustainable development at the altar of export-oriented high-technology production.

MAHARASHTRA

Still-Born Third Front

AN attempt to work out a united front of non-Congress, non-BJP-Shiv Sena forces in Maharashtra has ultimately failed. The Progressive Democratic Front (PDF) and Bahujan Shramik Samiti (BSS), the two main blocks of the emerging third front, have parted way and declared their separate plans of seat distribution.

Ever since the last assembly elections of 1990 the state Janata Dal (JD) unit has been facing rough weather. It suffered three splits which greatly reduced its strength in the assembly. First to depart were nine legislators, who left to join the Congress. Next, four legislators belonging to Sharad Joshi's Shetkari Sanghatana, who had been elected on the JD ticket, walked out. Lastly, when George Fernandes formed his Samata Party his followers in the state deserted the JD camp to join the new party. More serious damage to JD's image was done by Sambhaji Pawar, the former president of the state unit, who gave a clarion call to purge the party of 'brahminical' elements like Mrinal Gore, Madhu Dandavate and Bapusaheb Kaldate. Swiftly, Sambhaji Rao Kakade, a traditional rival of Sharad Pawar in Baramati, was made the chief of the party state unit. Thus, PDF which had won 40 seats in the 1990 assembly elections and was composed of JD, Peasants and Workers Party (PWP), Republican Party of India (Khobragade), Shetkari Sanghatana, Datta Samant's Kamgar Aaghadi and the two main communist parties was largely defunct by last year.

In the meanwhile, the Prakash Ambedkar-led Bharatiya Republican Party (BRP) and Bahujan Mahasangha (BMS) combine registered an upward swing. Besides sending two MLAs to the state assembly, the combine captured 15 zilla parishads and 40 panchayat samitis in the state. In these elections, it worked out a winning dalit-OBC-Muslim configuration, popularly known as 'Akola pattern'. The left in the state, in the face of the impending GATT treaty, had joined hands across party lines to launch the Shramik Sangharsh Samiti (SSS). Given the successful performance of BRP-BMS and the redundant nature of PDF, it was but natural that the left should forge an alliance with the former to constitute the Bahujan Shramik Samiti (BSS).

The drubbing the Congress received in the assembly elections in Andhra and Karnataka and the continuance of the BJP-SS alliance in Maharashtra goaded the

secular and progressive forces in the state to attempt a broad third front. The Bahujan Samaj Party (BSP) which was flying high and claiming to contest 288 Maharashtra seats independently had its wings clipped in the Andhra and Karnataka elections. Kanshiram, its leader, started to speak of giving priority to the bahujan movement in place of electoral politics. Yet the parleys between PDF (now composed of JD, PWP and RPI-Khobragade) and BSS continued to vacillate, with each making exaggerated claims of strength. V P Singh tried to inject urgency into the proceedings and was largely responsible for the Shivaji Park rally of January 2. But the rally which was conducted under the banner of Bahujan Shramik Mahapanchayat and witnessed the presence of 17 diverse parties proved to be an anti-climax.

Already a few important sarpanches were missing from the mahapanchayat. Sambhajirao Kakade of JD, Datta Patil of PWP and Mulayam Singh Yadav (who had said that he would attend the panchayat) were absent. Later, it was revealed that the regional leadership of JD was displeased at V P Singh attending the rally against their wishes. Within the JD fold, Kakade is known to be a close ally of Ramkrishna Hegde, who with the recent triumph in Karnataka, is demanding autonomy for regional JD units. Obviously, V P Singh's interference in Maharashtra affairs was not welcomed. Further, there is a backdrop of enmity to the Kakade-Ambedkar relationship. During the Baramati by-election last year, BRP-BMS had fielded its own candidate against Kakade. In this context, V P Singh's display of affection for Prakash Ambedkar by attending the rally was like adding salt to the wound. The mahapanchayat also decided to accommodate the Samata Party which is posing a challenge to Laloo Prasad's JD in Bihar. This development confounded the Maharashtra JD unit on whether to enter into a tie-up with a party which is its avowed rival in another state.

The strain of working out political equations across regional variations was felt by other parties too. The politburo of CPI(M) was not too keen that its state unit should share a common platform with BSP. Kanshiram during his forays into Bengal had voiced his intentions of toppling the Left Front government there. Even Mulayam Singh dispatching his deputy for the rally raised quite a few eyebrows. Apart from Mulayam and V P Singh not seeing eye to eye with each other, it was very doubtful if Mulayam Singh would address an anti-Congress rally given that the survival of his government in UP depends on Congress support. Lastly, the bloated claims for seats made by every party made the process of

seat adjustment exasperating. At one stage, BRP-BMS asked for 212 seats, BSP-SP for 127 seats, Samajwadi Janata Party (Anil Gote) for 120 seats and the communists for 40. Whether this was a deliberate ploy to scuttle the deliberations, is a matter of speculation.

It is now clear that Maharashtra will witness a multi-cornered contest with the Congress and the BJP-SS alliance as the principal contenders. If a united third front had coalesced, the Muslims in the state, given their near-complete alienation from the Congress, would have voted for it. But now they would either remain neutral or vote for the Congress. The PDF and BRP-BMS are trading accusations, the latter alleging that the former had behaved like 'Sharad Dal' throughout the proceedings. It would not be surprising if the PDF and BSS concentrate their energies on defeating each other's candidates in the coming elections. In this process, the hopes of challenging the state's traditional maratha leadership by projecting a mahar alternative will have come to a sorry end.

NARMADA DAM

Need versus Greed

THE belated disclosure of the collapse of a part of the Narmada dam during the floods in September last (news of which had been suppressed by the dam authorities and the government all these months, and which came to light only when leaders of the Narmada Bachao Andolan, the anti-dam movement, met the press in Delhi recently) reinforces the allegations, suspicions and misgivings that have bedevilled the Narmada dam ever since its conception.

To come to the recent disaster, it was apparently caused by what the authorities now describe as 'unprecedented rainfall', as a result of which a massive chunk of the dam structure was washed away by the floods creating a huge crater. According to reporters who recently visited the spot, the crater contains relics of a major component of the dam known as the 'stilling basin'. While the dam authorities are dismissing the disaster as damage 'not uncommon' during construction, representatives of the Narmada Bachao Andolan point out that although the dam was supposedly designed to withstand a 'once-in-100 years' flood (according to official claims), the September floods were nowhere near that intensity. Obviously therefore there must have been something wrong in the design of the dam – a suspicion voiced not only by the activists of the Narmada Bachao Andolan, but by engineering and environmental experts all

these years. One of the casualties of the September floods is the power house of the Narmada dam, which was submerged under almost 20 metres of water, thus throwing out of gear its power generating capacity – the only component of the dam which made it economically viable in the opinion of the World Bank.

While the Narmada Bachao Andolan activists are reiterating their demand that the government stop the construction of the dam, the authorities are sticking to their determination to continue work at the dam site, in spite of the latest disaster which is being attributed by engineers to faults in construction. But technical flaws and the consequent risks are only one, though not minor, part of the Narmada dam story. The displacement of thousands of villagers and their resistance, the obduracy of the government in persisting with the project in spite of a World Bank investigation team's censure of the Indian government's poor plans for rehabilitation, and the international support and solidarity from environmental and human rights groups that the Narmada Bachao Andolan has received are now a part of history.

A film of this history, shown recently in Delhi, ironically enough, coincided with the press leak about the latest scandal surrounding the collapse of a part of the Narmada dam. Ali Kazimi's feature-documentary 'Narmada: A Valley Rises' chronicles the main events in the long struggle that the threatened villagers of the Narmada valley had been waging against the construction of the dam – a misbegotten enterprise which is being touted by New Delhi as 'one of the world's largest 'development projects'. Kazimi's film questions this concept of 'development' – through the voices of both the tribal villagers and the middle class activists who had joined them to resist their displacement from their traditional homeland. One such activist tries to integrate his experience in the struggle with a political perspective as he tells the story of his four-year-old nephew, whom he asked: "What do you want to do when you grow up?" He said, "I want to be a doctor". The uncle felt happy hoping that the boy wanted to serve the people. But when he further asked him what he would do when he became a doctor, he said "I will get a big car. After that, a big house. My mother has said that unless I get a big car or house, she will not live with me." This is the notion of 'development' that has been dinned into the mind of a four-year old boy. Development has become synonymous with the greed of the rich in the perception of the poor. As Baba Amte at one stage in the film says: "It is a struggle between 'need' and 'greed'."

CURRENT STATISTICS

EPW Research Foundation

Though the provisional index of wholesale prices shows the annual inflation rate to have fallen to 9.8 per cent, when the final figures come out the rate will be seen to be above the two-digit level still. The rise in the cost of living indices continues to gain momentum. While monetary growth has been arrested somewhat, the expansion in non-food advances at Rs 20,223 crore so far in the financial year against Rs 276 crore last year has been phenomenal. Share prices have fallen further with the Sensex and the National Index showing over-the-year declines of 7 to 8 per cent for the first time since March 1993. In external trade an export growth of 15.1 per cent has been accompanied by a 32.2 per cent rise in non-POL imports, thus marking the re-emergence of the country's traditional high import propensity

Notes: (i) Superscript numeral denotes month to which figure relates, e.g. superscript * stands for September. (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year.

Prism Cement

PRISM CEMENT, initially incorporated as **Karan Cement**, is establishing a state-of-the-art cement plant with a capacity of 2 mtpa of ordinary portland cement in Satna in north Madhya Pradesh. Production is expected to begin in November 1996. The plant location has the dual advantage of proximity to the cement deficit markets in the northern and eastern parts of the country and availability of limestone, coal and other inputs close to the plant. The plant site is well connected by road and rail. The project has been appraised by Industrial Credit and Investment Corporation of India (ICICI) and International Finance Corporation, Washington (IFC-W) and the cost is estimated to be Rs 575 crore. IFC-W has sanctioned a term loan of \$ 30 million and is participating in equity to the extent of Rs 15.75 crore. ICICI has sanctioned a term loan of Rs 80 crore and is underwriting Rs 20 crore. For part financing the project the company is entering the capital market on January 31 with two simultaneous but unlinked public issues of 7,87,60,000 equity shares of Rs 10 each at par aggregating Rs 7,876 lakh and 37 lakh 13.5 per cent secured redeemable partly convertible debentures of Rs 250 each at par aggregating Rs 9,250 lakh. The company has also made arrangements for buy-back of non-convertible portions of debentures with UTI and HDFC. The issue is to be lead managed by ICICI Securities and Finance Company, SBI Capital Markets, DSP Financial Consultants and Kotak Mahindra Finance.

Shriyam Securities and Finance

Incorporated as **Spotlight Trade and Finance**, **Shriyam Securities and Finance** is engaged in merchant banking, custodial service to mutual funds and other entities, stock broking as a registered member of the stock exchanges, sponsor of OTCEI financing and assisting in providing venture capital. The company has been awarded membership of the National Stock Exchange for both wholesale debt market and capital market. The company is entering the capital market on January 19 with a public issue of 1 crore equity shares of Rs 10 each at a premium of Rs 20 per share

aggregating Rs 3,000 lakh including firm allotment of 20 lakh equity shares to mutual funds and 20 lakh equity shares to financial institutions aggregating Rs 1,200 lakh. The project has been appraised by ICICI. The funds will be used to strengthen the existing infra-structural facilities and to augment resources for further growth and diversification. The issue is to be lead managed by ICICI Securities and Finance and J M Financial and Investment Consultancy Services.

Awas Ayogen Vittingam

Awas Ayogen Vittingam is operating in the field of housing finance. It promotes ownership housing by providing finance. Awas has been classified as a housing finance institution by the National Housing Bank. The company, seeing the growing demand for housing in and around Gujarat, specifically in the rural areas, has decided to undertake an expansion of its current business. For this it needs to augment its long-term resources and capital. To part finance the project the company is entering the capital market with a public issue of 23,80,000 equity shares of Rs 10 each at par aggregating Rs 238 lakh. Bank of Baroda has appraised the project and the cost is

estimated to be at Rs 434.99 lakh. The issue, slated to open on February 9, is to be jointly managed by Doogar and Associates and H M Desai Shares and Financial Consultancy Services.

Indo Holland Agro Exports

Indo Holland Agro Exports is engaged in floriculture and is entering manufacture of greenhouses in a big way. The company has imported the latest Dutch technology for its floriculture project and is focusing on building on India's natural advantages of abundant sunlight, cheap labour and low requirements of energy. To cut the project cost the company has diversified into manufacturing its own greenhouse system which would match the best poly greenhouses available in the world and be highly cost effective. The company expects to cut the cost of greenhouses of equivalent quality and sophistication by almost one-third. It will produce a complete range of greenhouses from simple poly tunnels to huge multi-span greenhouses. Orders for the first batch of greenhouses have been booked. Encouraged by this the company is thinking of hiving off the greenhouses division into a separate company.

INDIAN SEAMLESS METAL TUBES

Affected by Recession

THE flagship company of the Indian Seamless Group, Indian Seamless Metal Tubes (ISMT) has shown mixed results for 1993-94, with net sales going up by 2 per cent, operating profit falling by 6 per cent and net profit rising by 17 per cent. The boost to net profit was attributed to the 33 per cent increase in other income, 22 per cent decrease in depreciation and a rise in non-operating surplus by Rs 3.26 crore. ISMT declared a dividend of 32 per cent for year against 30 per cent for the previous year. Exports were higher by 25 per cent while imports fell by 59 per cent.

Debt-equity ratio shows a steady decline from 112 per cent in 1991-92 to 68 per cent in 1992-93 and 57 per cent in 1993-94. Short-term bank borrowings fluctuated at 39 per cent in 1991-92, 41 per cent in 1992-93 and 17 per cent in 1993-94. Sales to total assets ratio declined by 18 percentage points after having been steady at 78 per cent for two years, while the sales to gross fixed assets ratio fluctuated at 120 per cent in 1991-92, 130 per cent in 1992-93 and 109 per cent in 1993-94. Remuneration to employees increased marginally.

Operations were affected by the recessionary trends in the engineering industry. To cope with the situation, the company to absorb the increased cost and even reduce prices and extend longer credit to customers. An ultrasonic testing machine for testing bearing tubes and controlled atmosphere arrangement for the cold draw annealing furnace was installed as a measure of quality improvement. During the year, Seamless Tubes and Technologies (India) (STTIL) amalgamated with the company. This being a kind of vertical integration, the company expects to improve its performance with the addition of high value added products such as cold rolled rings and fuel injection tubes. The company was successful in obtaining ISO-9002 certification and this is expected to help in boosting the exports. It is also embarking on a plan to increase its downstream processing thereby enhancing value addition and quality of the products.

Indian Seamless Steels and Alloys (ISSAL), an associate company, commenced commercial production during the year and its output has been steadily rising. ISSAL has established production of quality steels at competitive operating costs. It is now planning to enlarge the product range by installing a downstream rolling mill. With the objective of reducing cost of raw material

the company is installing a mini blast furnace. Indian Seamless Financial Services fared well in 1993-94. It has commenced merchant banking operations and is actively involved in underwriting and issue management. Commercial production at Taneja Aerospace and Aviation started from 1994 and two aircraft have been sold. Commercial production of two-seater all-composite trainer aircraft named Hansa-3, jointly developed with National Aerospace Laboratories (NAL), is to commence in the second quarter of 1995.

CAPRIHANS (INDIA)

Expansion and Modernisation

Caprihans India (CIL), a Kalpataru group company, is a leading player in the soft PVC market manufacturing opaque sheetings, printed films, transparent films and films developed for customised applications. It has one of the largest product ranges among all PVC film manufacturers. Most of the products are intermediate products which are later converted and sold for final consumption to customers. The company has done well in 1993-94, with net sales going up by 23 per cent, operating profit by 14 per cent and net profit by 90 per cent. The 89 per cent increase in other income was balanced by an 83 per cent fall in non-operating surplus. The 33 per cent increase in depreciation was more than offset by a 71 per cent decline in taxation. A 35 per cent dividend was declared for the year against 30 per cent in the previous year. Exports fell marginally while imports were up by 121 per cent. Debt-equity ratio fluctuated at 30 per cent in 1991-92, 23 per cent in 1992-93 and 47 per cent in 1993-94. Sales to total assets and sales to gross fixed assets ratios declined by 32 percentage points and 65 percentage points, respectively, in the past three years. Remuneration to employees has been increasing marginally in the past three years.

The company crossed the rupees hundred crore mark during the year. The company's plan for expanding capacity by 100 per cent at Nasik for manufacture of PVC film and sheetings has made substantial progress. Both the calendaring units have commenced commercial production. This means that raw material requirement would increase substantially. Also, the simultaneous modernisation the company has embarked on has led to the rationalisation of product flows, removal of bottlenecks, upgradation of product quality and cost advantages. The

company faces stiff competition from small scale and unorganised sector units which enjoy a substantial price advantage. During the year the company commenced development of a property in central Bombay which would be a multi-storeyed commercial complex.

Caprihans invested Rs 12 lakh on R and D activities in the year. The major activities that were undertaken were the installation of an R and D unit at its Nasik plant. All the manufacturing units are being provided with facilities for on-line quality control. Also, individual customer-oriented products are being made to meet the specific needs of end-users. R and D efforts have helped the company in containing costs despite rise in cost of raw materials. The company having pioneered the concept of hollow corrugated boards (HCB) in India which is a superior substitute to corrugated paper boxes though also eight times more expensive, is now concentrating on increasing the applications for this product. The company also plans to develop products in the high technology PVC area, particularly for defence applications. Its R and D activities have also helped in the reduction of scrap at manufacturing point.

FINOLEX PIPES

Backward Integration

Finolex Pipes did not do well in 1993-94. Though net sales were up by 17 per cent, operating profit and net profit were down by 19 per cent and 54 per cent, respectively. A fall of 45 per cent in other income and of 76 per cent in non-operating surplus and a 28 per cent increase in interest charges coupled with a 66 per cent hike in other provisions all contributed to the lower margins. Despite this the 10 per cent dividend has been maintained. Debt-equity ratio fell sharply from 642 per cent in 1991-92 to 78 per cent in 1993-94. Short-term bank borrowings on the other hand shot up sharply by 21 percentage points in the span of three years, while the sales to gross fixed assets ratio registered a fall of 39 percentage points in the same period. Remuneration to employees has shown an increase from 3 per cent in 1991-92 to 10 per cent in 1993-94. Net value added to value of production declined by 20 percentage points in the same period.

Sales of pipes and fittings were affected mainly due to the prolonged transporters' strike and the lower utilisation of productive capacity compared to the previous year. According to the company, profits for the

previous year had been higher because of extraordinary income and income earned by the way of dividend, capital gains, etc, on deployment of temporarily surplus funds raised for the PVC resin project. In the year under review, these funds were used for the project and thus income attributable to this source was lower.

Till 1994, the company was a single product manufacturing unit producing rigid PVC pipes and fittings. It recently undertook a backward integration programme by diversifying into PVC resin production. This project of Rs 630 crore went on stream in April 1994. Encouraged by its performance, the company is planning to expand its capacity by 1.2 lakh tonnes. The entire PVC requirement would now be met internally and therefore the company expects to lower its manufacturing expenses by a significant 20 per cent. De-bottlenecking operations to increase production are also being planned. The company's new product developed in-house, viz, SWR pipes and fittings was to be launched during the year. With shift in demand from smaller size pipes to bigger size pipes, where margins are higher, the company expects to improve its performance and margins. The company has set up an open sea cryogenic jetty at its Ratnagiri plant and this has now become operational, but during the monsoon the Ratnagiri ports are officially declared closed. As there are no breakwaters, the jetty is fully exposed to the weather causing the water to go up around 4-5 meters. This renders berthing and unberthing operations unsafe, thereby seriously affecting the operations of the company. The company was shut from May 29 to June 23, 1994 due to technical problems and this would affect its performance in 1994-95.

The company's R and D department has been undertaking continued development of new types of pipes fittings, new raw material formulations and new production techniques.

LAKHANPAL NATIONAL

Upgrading Technology

Lakhanpal National, a joint venture between Matsushita Electric Industrial Company of Japan and the late DD Lakhanpal, is engaged in the manufacture of dry cell batteries. The collaboration is a technical as well as a financial one with Matsushita holding 40 per cent stake in the company's equity. 'Novino Gold' is one of the popular brands under which the company markets its products. Net sales were up by 8 per cent, operating profit by 35 per cent and net profit by 119 per cent in 1993-94. The 17 per cent fall in interest charges was balanced by the 16 per cent rise in depreciation. Though there was

a fall in other income by 17 per cent, non-operating profit was up by 500 per cent. A dividend of 25 per cent was declared. Exports were up by 985 per cent while imports were up by only 6 per cent. Debt-equity ratio has shown a steady decline from 126 per cent in 1991-92 to 104 per cent in 1992-93 and 64 per cent in 1993-94. Short-term bank borrowing has declined slightly. While sales to total assets went up by 8 percentage points in the past three years, sales to gross fixed assets declined by 5 per cent in the same period. Fall in inventories led to a negative capital growth in the year. Remuneration to the employees fluctuated at 33 per cent in 1991-92, 36 per cent in 1992-93 and 31 per cent in 1993-94. Net value added to value of production has shown a steady rise in the past three years.

With the objective of maintaining its market share in the liberalised environment, the company has been giving a thrust in the areas of quality and least cost manufacturing. Technology upgradation is also being undertaken along with quality improvement to meet the specific needs of the market. As a step towards globalisation, the funds raised through the issue of capital are proposed to be used for expansion of production capacity by establishing a new plant for manufacturing hi-tech eco-friendly mercury free penlite dry cell batteries. Commercial production is to commence this year. There was a quantum leap in the exports of spare parts during the year. The company has also started exporting battery components to other countries.

The R and D centre of the company has the recognition of the government of India. Efforts to indigenise critical high value items, quality enhancement and development of new products are being undertaken. Efforts are on to absorb battery grade separator paper manufacturing technology to suit the requirement of the Indian market.

BURROUGHS WELLCOME

New Drugs

Burroughs Wellcome is engaged in the manufacture of bulk drugs, chemicals, formulations and cosmetics. The company is a market leader in several drugs having therapeutic uses. The net sales of the company went up by 21 per cent with the new third generation drug, Cefizox, faring well in the market along with Tracrium, actified plus tablets, theo-pa tablets, septran and calpol. Operating profit of the company was up by 48 per cent and net profit by 81 per cent. Net sales would have been even higher but for the rise of 204 per cent in taxation of 14 per cent in depreciation and of 5 per cent in interest charges. The increase in other income by 62 per cent helped in holding up

margins. Exports were up by 110 per cent while imports were up by 75 per cent. A 22.5 per cent dividend was announced for the year against 18 per cent in the previous year. Debt-equity ratio has shown a steady decline from 44 per cent in 1991-92 to 31 per cent 1992-93 and 23 per cent in 1993-94. Short-term bank borrowings have fluctuated at 40 per cent in 1991-92, 51 per cent in 1992-93 and 29 per cent in 1993-94. Sales to total asset ratio has been steady at 174 per cent for the past two years while sales to gross fixed assets ratio grew by 83 percentage points. There was a large fall in inventories by Rs 7.61 crore due to which gross capital formation was negative. Remuneration to employees fell marginally.

The company undertook replacement of old machines during the year. The granulation section of the tablet department was renovated and technically upgraded in line with current good manufacturing practices (CGMP). Old machines and vessels in the tablet and liquid departments were replaced with new and high speed machines and vessels thereby increasing efficiency in both the departments. The sterilised product manufacturing facility has been geared up for manufacture of neosporin eye drops after reformulating it. A new automatic high speed blister packing machine with collator and non-fill detection system has been installed in the packing department which has increased the blister packing capacity for tablets. The chemical division has initiated measures for improved processes and products and the use of certain raw materials has been reduced.

The company plans to introduce new drugs. Cefspan an oral drug, an original product of the Japanese Fujisawa Pharmaceutical Company, is now registered by the company in India and is to be introduced shortly. Burroughs Wellcome has obtained permission for marketing two original Wellcome discoveries, Wellferon and Exosurf.

The company incurred an expenditure of Rs 85 lakh on R and D in 1993-94. The company has a well equipped R and D laboratory. Reformulation of existing products, developing new pharmaceutical dosage forms and process modifications are some of the activities that are being undertaken by the department.

Students' Rights

A G Noorani

The issues raised by the Campus Committee for Academic Freedom set up in Bombay University, most importantly that of freedom of speech and expression for students within the campus, should provide the occasion for a serious effort to draw up a charter of students' rights and duties.

THE Campus Committee for Academic Freedom (CCAF) set up on the Kalina campus of Bombay University by its students would do well to invite major students' bodies in the country to co-operate in drawing up a considered and comprehensive charter of students' rights and duties. Politicians who are dying to cash in on students' unrest are best left out.

Aruna Chakravarty of *Indian Express* has done a service by reporting (on December 21 and 23, 1994) on the activities of CCAF. On December 20 students voted in a 'referendum' on a resolution seeking full "freedom of speech and expression" within the campus. Of the 750 votes polled, 719 supported the resolution. The report lists grievances by no means unique to the Kalina campus. Nor are they unprecedented. That, of course, is no reason for taking them lightly, rather for taking concerted action on them. The grievances are:

(1) Students of the Humanities Division Forum were debarred from meeting in the campus library, as they used to regularly, because the discussions could become 'controversial'.

(2) The monthly campus magazine *Challenge* was not permitted to be released or sold for want of 'requisite permission' from the university authorities. The decision was rescinded after a signature campaign against it. Later the authorities demanded information regarding the magazine which led to the stoppage of sales in August this year. The pro vice-chancellor is reported to have said that sale of "anything except canteen food within the campus precincts" was forbidden.

(3) The play '*Dono Mare Jayenge*' written by a student after the Bombay riots in 1993 was stopped from being performed. When the writer/producer, Vijay Akila, persisted, he was thrown out of the campus hostel.

(4) In October this year the University cancelled the booking of the J P Naik Bhavan where a talk by the suspended deputy municipal commissioner, G R Khairnar, was scheduled. When the students went

ahead regardless, a show of force by security guards and policemen was staged.

(5) No elections have been held to the Post-Graduate Students' Union (PGSU) though students have been regularly paying the union fees.

(6) There is no students' council to air students' grievances.

(7) Access to the vice-chancellor is denied to students.

The pro vice-chancellor, V N Gupchup, asserted, "we are not controlling the views of the students". But in some respects he only confirmed the students' grievances: "We stopped the sale of *Challenge* because they used to set up counters for the sale of the magazine". What was so wrong about that? If the counters caused any obstruction appropriate alternative sites could have been arranged. According to students, Gupchup himself had in their presence ordered the deputy registrar to 'take action' against students who sold the magazine. "When we asked him whether we could distribute the copies, he said we would have to give an application and a committee would look into the matter."

Students allege that they were asked to submit applications for permission to collect funds for Latur earthquake victims and there was no response to the applications even after two and a half months. The pro vice-chancellor as well as the librarian denied any ban on meetings in the library. They were 'unaware' of the meetings in the first instance.

Here is an appropriate case for an inquiry by one of the civil liberties bodies. Universities are 'state' within the meaning

of Article 12 of the Constitution and their authorities are bound by the chapter on fundamental rights in the Constitution. That includes the fundamental right to freedom of speech and expression embodied in Article 19(1)(a).

Section 43(1) of the British Education Act, 1986 provides an apt parallel. It deserves incorporation in our University Acts. It reads thus: "Every individual and body of persons concerned in the government of any establishment to which this section applies shall take such steps as are reasonably practicable to ensure that freedom of speech within the law is secured for members, students and employees of the establishment and visiting speakers."

It may be recalled that the authorities of Maharaja's College, Ernakulam, had ordered the suspension of the printing and distribution of the college magazine for 1984-85 a few days after it had been formally released at a function at the college auditorium on September 10, 1985 (see this writer's article on 'Students' Magazines', *Economic and Political Weekly*, October 19, 1985, p 1768). The principal of the college had taken exception to the Malayalam translation of a review by Mrindula Sood of a PUCL report on the Delhi riots published in *Indian Express* of December 9, 1984.

The problem arises because college authorities are generally the 'publisher' of college magazines and Section 7 of the Press and Registration of Books Act, 1867 provides for a legal but *rebuttable* presumption that the editor or publisher shown to be such in a journal shall be held (unless the contrary be proved) to be editor or publisher of "every portion of that issue". No editor or publisher can be held accountable for every portion. In any case this 127-year old statute calls for a review. The ingredient of actual knowledge or mens rea should be written into S 7.

That apart, the wider question of students' rights must be tackled in earnest. It goes without saying that no charter would be complete which does not provide for students' duties as well. In this exercise issues that commonly arise such as police entry on the campus must also be addressed properly.

RBI's About-Turn

December 1994 ended with the central bank injecting Rs 2,000-2,500 crore into the market to quell the money market's riotous behaviour in an about-turn from the beginning-of-the-month objective of contracting primary liquidity and containing money supply growth.

I

Backdrop Developments

THE country's central bank was much in the limelight in December 1994 insofar as the money market was concerned. First, it was the open market operations of the Reserve Bank of India (RBI) which it had begun resorting to in November to contain primary money growth. In December the RBI switched gears after absorbing less than Rs 110 crore in the initial stage as the market was turning dry; the RBI also had the primary task of fulfilling the government's borrowing requirements. Therefore came the conversion offer of 364-day treasury bills for which, however, the authorities drew a blank as expectations went all wrong. And the month ended instead with the central bank injecting Rs 2,000-2,500 crore through the Discount and Finance House of India (DFHI) and the Securities Trading Corporation of India (STCI) to quell the money market's riotous behaviour – quite an about-turn from the beginning-of-the-month objective of contracting primary liquidity and containing money supply growth.

(a) OPEN MARKET OPERATIONS

During the early part of the month, the RBI continued with its open market operations (OMOs). Having unsuccessfully experimented with a short-dated security (7 per cent 1998 for a price of Rs 90.27) towards the end of November, the central bank came round to a safer bet and offered the converted 11.75 per cent long-dated security maturing in 2001 at an attractive price of Rs 102 or a yield to maturity (YTM) of 11.3090 per cent per annum on December 1. The previous day's traded price of this paper was Rs 102.20 at a YTM of 11.2665 per cent and the total amount sold by the RBI was Rs 100 crore.

On December 5, it replaced the above security with 12 per cent 1999 at a price of Rs 103.34 which, however, remained on tap only for a day. Also, at a yield of 11.0004 per cent, the market picked up just Rs 10.1 crore worth of this security. On December 6, the RBI adopted a passive stance and offered a very old, dormant 6.25 per cent 1996 paper at Rs 92.31. Though attractive in itself, since a 12.75 per cent paper maturing in the same year was trading in the market at a yield of around 10.33 per cent, there were no takers for the 6.25 per cent paper.

Thereafter the OMOs came to a halt during the month. The indications are that the RBI may no longer be able to do OMOs for quite some months now unless it offers phenomenally high yields. The latter would be disruptive of the yield structure in the market. That apart, the OMOs cannot be a preferred option for the authorities in a situation where the secondary expansion is more dominating than the primary money expansion, though the gospel of monetarism which has inspired the policy planners may not allow for any such fine distinction. Besides, banks have already begun a deposit rate war in order to compete for deposit resources but this would soon compel them to hike their prime lending rates. It would in turn bring to the surface many conflicting elements. Having freed them, the RBI may not be able to prevent a firming up of the banks' lending rates which are already high for the borrowers except the top-rated companies. In fact the RBI may prefer higher interest rates on the assumption that they may curb inflation. But, in a situation of slack real economic activity, the more probable consequences of higher interest rates would be a further reduction in economic activity as well as stimulus to cost-push inflation.

(b) CONVERSION OFFER FOR T-BILLS

A significant development during the month was the government's offer to convert over Rs 3,700 crore worth of 364-day t-bills into a dated security. These were the balance t-bills from the lot offered earlier but which remained unconverted. In March 1994, the government had offered to convert over Rs 22,000 crore of 364-day t-bills maturing between January 6 and March 17 this year into 10-year security at a coupon rate of 12.5 per cent. The market had accepted the conversion of Rs 11,226 crore worth of the bills or 59 per cent of the bills offered.

Against the background of the new floatation of an 8-year security which had attracted massive excess subscription at a cut-off yield of 11.55 per cent in the previous month, the yield of 11 per cent for three years in the latest conversion offer could be said to be attractive. But the market found this offer quite unattractive and dragged its feet. The market players were apparently guided by the prevailing yield rates in the secondary market. The 364-day t-bills maturing in December 1994 and February

1995 were traded in the range of 9.47-10.46 per cent as per the SGL data released by the RBI, while the 12 per cent government paper maturing in 1995 was trading at 10.8 per cent plus. Also, when the conversion offer was made in the last week of December, the call money market was ruling at 12-13 per cent. Even so the authorities were probably expecting that at least about 50 per cent of the eligible bills would get converted.

Contrary to the official expectations, the already tight liquidity position which was induced by a few bulk demands and which was further accentuated by uncertainty prevailing in the money market on account of the ensuing 85 per cent average cash reserve ratio maintenance beginning January 7, 1995 contributed to the building up of lukewarm market response on the conversion offer. In order not to get caught on the wrong foot, the market preferred to keep enough liquidity or at least hold short-term liquid paper as asset. Clearly, while the market preference had undergone a transformation with the demand for commercial credit picking up rather significantly, the authorities were probably influenced by the earlier enthusiasm which banks in particular showed for sovereign debt instruments *vis-a-vis* commercial credit because of no provisioning requirements for the former. The response of the market to the conversion offer turned out to be not only far below the expectation but abysmal. As against the amount of over Rs 3,700 crore which was eligible for conversion, the RBI received offers for converting only Rs 107 crore which was a piddling 2.8 per cent of the eligible bills.

(c) GROWING LIQUIDITY CRUNCH

Bankers' preference for liquidity over short-term attractive return was understandable. The money markets had been moving towards a tight liquidity regime since late November. On the supply side, the sources of liquidity seem to have got dried up. RBI's foreign exchange assets (other than gold), which had touched \$ 20 billion (or Rs 61,887 crore) on October 28, have since then declined to \$ 19.39 billion (Rs 61,391 crore) as on December 30, 1994. For the past one month ending December 23, aggregate deposits of scheduled commercial banks have stagnated, in fact fallen by Rs 57 crore, in contrast to a rise of Rs 6,599 crore in the corresponding period last year. 'Other deposits' with the RBI, which represent essentially the float funds of the public sector financial institutions and which had touched Rs 4,181 crore on November 25, have been lower since then; they were at Rs 2,684 crore as on December 16, 1994. On the demand side, almost an equivalent of over Rs 11,000 crore of liquidity has been plucked out of the system in bulk deals during November and December: Rs 1,630 crore in RBI's open

GRAPH A: DAILY TOP-END QUOTATIONS OF CALL MONEY RATES SEPTEMBER, NOVEMBER AND DECEMBER 1994

market operations; Rs 1,000 crore as two instalments of subscription to the 8-year partly-paid new GOI security; subscription to the UTI's US-64 rights issue anticipated at about Rs 3,600 crore; PSU disinvestments amounting to Rs 2,500 crore; and advance tax payments due on December 15, variously placed but likely to be between Rs 2,500 crore and Rs 3,000 crore. Besides, bank credit to commercial sector has suddenly begun an uptrend. While it has been on the rise since October, the rise in December has been much more phenomenal. Between October 14 and November 11 bank credit expanded by Rs 3,990 crore but between November 11 and December 23 it increased by Rs 6,737 crore; in the latest fortnight ending December 23 alone there has occurred an expansion of Rs 5,092 crore. All these have happened when the deposit resources of banks have stagnated. Added to the strained liquidity situation, the 85 per cent of the prescribed cash reserve ratio that banks are expected to maintain on a daily basis from January 7 has prompted banks to be cautious and remain liquid. As such, rather than getting locked up for a three-year period, banks have preferred to get their cash back by not converting their t-bills holdings. To an extent, this may also have been induced by the desire to subscribe for the forthcoming mega capital issues.

By the third week of December, bankers' apprehensions regarding the liquidity tightness in the market were proved right. For, banks sold considerable amount of t-bills towards the end of December. On December 30, in 14 deals Rs 168.43 crore worth of 364-day t-bills maturing between January 6 and September 1, 1995 were sold outright, whereas 23 repo deals in 364-day t-bills maturing between January 20 and December 8, 1995 totalling Rs 392 crore were recorded in RBI's SGL transactions. There were even distress sales noticed according to which banks sold 364-day t-bills maturing on January 6 at YTM's

varying from 15.04 per cent to as high as 29.92 per cent.

II Market Developments

FIRMING UP OF CALL MONEY RATES

It looked as though both the market as well as the authorities were caught unaware of the impending wide gyrations in call money rates and the dizzy heights to which they climbed. The first nine days of the month formed the part of a reporting fortnight (ending December 9) when the call rates remained in the range of 5-7 per cent though there were brief intra-day spells of higher call rates of 7.25-7.75 per cent on December 7 and 8 mainly due to hectic last minute attempts at covering CRR by some of the private banks and small-size nationalised banks which have of late become active in the call money market. Rates finally fell to as low as 0.5-2 per cent on the reporting Friday which was in contrast to the high rates prevailing on both the reporting Fridays of November.

The next fortnight, however, began on a firmer note with rates going up to 12 per cent on the very first day (December 10) and gradually moving upward to reach 13.50 per cent on December 13 and 13.25 thereafter till December 16. The tightness in the call money market during December 10-12 was partly the fall-out of the artificial scarcity created by the special instructions to SBI not to circulate the float funds generated out of the subscription for PSU disinvestments. The overall hardening of call rates was also pepped up by heavy borrowing by foreign and private banks. Apparently the lending banks have not yet worked out clear exposure

limits for lending to private banks and hence were either reluctant to lend too much or were lending only at high rates. Apart from these special factors the hardening of call rates was reflective more of an underlying liquidity dry-up in the system, as explained earlier.

With the call rates remaining high, some banks in desperation but having export credit exposure tapped the RBI window for export refinance at 11 per cent which was lower than the prevailing call rates (with RBI credit to banks galloping by Rs 4,684 crore in one week ending December 16). Also, ready-forward deals in 364-day t-bills and permitted dated securities were sparked to life with deals worth of Rs 885 crore being transacted during the week ending December 16. Recovering from the shocks of the scam

period, banks have learnt to use the repo route when the call rates rule high. Also, in the situation of a scramble for liquidity, everyone had turned sellers of gilts and banks were finding it very difficult to locate buyers for such securities. Repos therefore became a preferred option, also as a hedge, particularly when gilts faced severe selling pressure.

The following week ending on reporting Friday (December 23) experienced gradual softening of call rates. On December 17, call rates opened on a firm note at 11.50 per cent and hovered around 6 to 10 per cent on December 19. This relatively high rate was mainly due to last minute borrowing by some foreign banks to cover their CRR requirements. The call rates then started

easing when it reached the range of 0.25-2.50 per cent on the reporting Friday. With this, there was a general expectation that the easiness would continue.

However, the market expectations were belied when the call rates started going into a dizzy spell during the rest of the month. On December 24, call rates opened on a firm tone at 10.25 per cent and thereafter started reaching higher tops each day: 12 per cent on December 26, 13.25 per cent on December 27, 18 per cent on December 28, 32 per cent on December 29 and further zooming to 55 per cent on December 30 with unconfirmed reports quoting even 65 per cent on that day. During December 24-30, the high call rates were due to (i) the absence of regular lenders, (ii) the curtailment of lending by the financial

SEPHIS

**The South-South exchange
programme for research on the
history of development**

The Sephis programme is concerned with comparative research on the history of development. It invites scholars from the South to make critical reassessments of development trajectories, their origins, course and effects. Under the overall theme Historicising modernity and development, Sephis endorses historical research on the following subthemes:

1. 'The forging of nationhood & the contest over citizenship, ethnicity and history'
2. 'Equity, economic and social transformations'

Under these subthemes the Sephis programme will give special attention to the search for new identities in the South and the meaning which categories such as class, community, religion, ethnicity and nationhood have for different groups of people in the South. The first subtheme focuses on identities and the second on problems of equity, in the context of economic and social transformations which have attended the advance of modernity.

◆ Fellowships for Post-Doctoral Research

In 1995, five fellowships are available for Post-doctoral research. Funding will be provided for travel and research costs, and salary according to local standards. These fellowships extend from a minimum of three months to a maximum of two years. *Eligibility:* Scholars who received their PhD degrees preferably within the last five years and who are employed by or affiliated to a University, a research institute or development agency in the South.

◆ Grants for PhD Research

In 1995, ten grants are available for PhD research. PhD Grants will be provided for a period from one to three years. The proposal must include a period of research and should make clear that the applicant can realistically complete his or her draft thesis in the given

time. Salaries are not normally included in Sephis PhD grants. *Eligibility:* PhD students enrolled at a Southern university, who are supported by their institution.

◆ Application for these grants should include:

- a research proposal (maximum of 5000 words) including a timetable [applicants for Post-doctoral fellowships should indicate the form of publication (book, article, etc.). Applicants for PhD grants should indicate the period needed to complete the draft thesis].
- an academic curriculum vitae
- a letter testifying to institutional affiliation
- a copy of the PhD certificate (for Post-doctoral fellowships)
- names and addresses of two referees (including telephone and possibly fax and E-mail numbers). Applicants for the PhD grants should also include a letter of recommendation by their thesis supervisor.
- preferably, an example of the applicant's work
- a budget

Research proposals will be selected by the Sephis Steering Committee, which consists of historians from different regions in the world. The applications will be evaluated according to quality, relevance to Sephis themes, comparative potential and contribution to South-South co-operation. The application must be received before **April 30, 1995**.

◆ The application – and all requests for information about the grants programme – should be sent to:

institutions with some of them even borrowing from the term money market, (iii) the emergence of SBI as a major borrower due to month-end demands for oil/defence payments, and (iv) an air of uncertainty regarding the possibility of upward movement of the general interest rate structure in the wake of inflationary spirals.

Apart from repetition of large repo transactions on December 29 (Rs 761 crore) and on December 30 (Rs 584 crore), the volatile and high call rates also forced quite a few banks to tap rupee export credit refinance from the Reserve Bank again.

The call rates dropped to 25 per cent towards the mid-day of December 30. Some dealers report that this decline was on account of the SBI moving back as a lender in a big way. Rates dropped further to 20 per cent later in the afternoon when the Reserve Bank injected Rs 2,000-2,500 crore into the market through DFHI/STCI, the rate remained at 18 per cent in the closing hours of Friday.

In another significant development, the traditional lenders, viz. financial institutions (FIs), turned borrowers for the first time in the term money market in which they were allowed to participate as borrowers in October 1993. Earlier, they could participate in the money market only as lenders. In the credit policy of October 1993 the RBI had allowed FIs to participate also as borrowers up to an aggregate limit of Rs 1,000 crore with the RBI fixing individual limits for borrowings from time to time. The leading institutions – IDBI, ICICI and IRBI – have reportedly tapped the market, although the reasons for their turning borrowers were not clear; presumably, they were trying to bridge short-term gap between demand and supply. It may be noted that IDBI's mega issue of Rs 2,400

crore was scheduled to tap the market in late January (which has since been postponed).

The call money market behaviour in December and the causes thereof are similar to those that occurred earlier in September 1994. Absorption of liquidity in 10-year state development bonds, as also the second instalment of advance tax payment by businesses, had resulted in liquidity squeeze in September giving rise to wide fluctuations in call rates. A series of bulk transactions as explained above brought about a liquidity crunch in December giving rise to similar gyrations of call rates. Due to an acute resource crunch, DFHI's call money rates were much higher in December than in September. The money market behaviour also has had its repercussions on the domestic foreign exchange market, though somewhat differently on two occasions. In September the banks short of rupee funds sold dollars, which sent the swap premia for the dollar in the cash/spot and tom/spot markets zooming. Banks were even borrowing dollars from their overseas branches and nostro accounts and selling them in the swap market in India, essentially because of the large arbitrage possibilities that obtained then as a result of the wide differentials between

domestic and international interest rates. While the average of the annualised forward premia in the spot/cash market for the middle two weeks of September touched 20.94 per cent and 17.20 per cent, respectively, the corresponding premia for the six-month period remained at 1.68 per cent and 2.25 per cent. Contrariwise, in December there was a large demand for dollars due to the month-end/year-end release of foreign exchange for oil and defence purchases combined with the slower pace of inflows following rising import surpluses, reduced portfolio investment by FIIs and GDR funds kept abroad. As a result, the forward premia for the term contracts (3-month and 6-month) were higher than those for the spot/cash deals (see 'Current Statistics', EPW, January 7, 1995). Instead, the rupee depreciated to an extent against the US dollar almost throughout the month with the RBI's reference rate ruling somewhat above the now near two-year sticky rate of Rs 31.37 per US dollar, even though the dollar has been depreciating against other major currencies.

Developments in December suggest that the market players are gradually becoming more sophisticated by resorting to fresh instruments even as the authorities are

encouraging institution build-up in the market. Apart from the DFHI, the RBI is reported to have used the STCI for extending some additional liquidity into the system. The National Stock Exchange of India (NSE) has facilitated the trading of commercial paper (CP) on its screens for the first time (Table 5). A constraint in the call money market which surfaced during this period of liquidity stringency has been the absence of agreed exposure limits set by the lenders for the new private banks which have as yet inadequate deposit base. In instrument promotion, a CP-like instrument in the form of floating rate bonds with the backing of a system of revolving underwriting facilities (RUFs) have been evolved by some corporates probably as an answer to the RBI delinking the CP from cash credit limits. Faced with stringency in liquidity, banks have made use of bills rediscounting as well as repo deals because the funds so generated do not add to the net DTL of the borrowing banks.

POOR RESPONSE TO RBI'S AUCTIONS

Both the repurchase as well as primary auctions by the RBI experienced declining interest with the market forthcoming with less and less of bids. As a result, the RBI had to offer higher yields on government paper and also take an increasing share in the 91-day treasury bills auctions, though the last two auctions of 91-day bills saw higher contributions from non-competitive bidders who absorbed the slack relieving the RBI of shouldering devolvement. Even so, the RBI had to raise the yields in all the primary auctions – repos, 91-day t-bills and 364-day t-bills (see Tables 2, 3 and 4 and Graph B).

Apart from the declining response and rising cut-off yield rates, a distinct aspect of the cut-off yields pattern in primary auctions of December was the closing of the difference as between 91-day and 364-day t-bills (Graph B). In the auctions of the first week of December, while the cut-off yield

on 91-day t-bills was 9 per cent, that on 364-day t-bills was 9.83 per cent. In the third week the corresponding yield rates were 9.84 and 9.91, respectively. Likewise, in the next batch of auctions of 91-day bills (on December 30) and 364-day bills (on January 4, 1995), the comparable cut-off yields were 10.26 per cent and 10.56 per cent, respectively. In general the market has shown a slight preference for the one-year bills.

SECONDARY MARKET

Reflecting the tight liquidity situation, there was considerable selling pressure in short- and medium-term money market instruments in December. As a result, prices of these instruments constantly fell while the yields rose. Interestingly, the month-end period saw a good deal of activity in repos (other than those with the RBI), particularly in short-term paper such as 91-day and 364-day t-bills.

Zero coupon bonds and converted securities continued to dominate the secondary market with over 11 per cent yields. Interestingly, the month also saw some significant activity in a few state government securities. Maharashtra, Tamil Nadu, Bihar, Andhra Pradesh and even Jammu and Kashmir paper witnessed selling activity. The amounts sold, however, were insignificant and indicated that these were genuine deals rather than speculative ones.

Considerable interest was shown in 364-day treasury bills too, especially those maturing between January 1995 and September 1995. The yields varied in the range of 9 per cent at the short-end to 12 per cent at the long-end. There were, however, quite a few distress sales offering yields of over 29 per cent towards the end of the month indicating, as explained above, the difficult liquidity situation in the market. On December 30, for instance, two deals were done in 364-day t-bills maturing on January 6 at YTM of 15.0454 and 15.9556 per cent

and four deals were done at rates between 27.9223 and 29.9204 per cent; the total amount of these transactions was a significant Rs 120 crore. On the same day a large number of repo transactions worth Rs 392 crore were also recorded by the RBI in its SGL transactions. However, the NSE operations showed no significant improvement either in the order value or the traded value (Table 5).

(a) Government Securities

Reflecting the liquidity crunch, the government securities traded at a higher yield. 12.5 per cent government stock maturing in 2004 was traded at a yield of 11.693 on December 1 which was higher by a couple of decimal points from the yield on the same security traded earlier. Prices of other securities also marginally fell during the first reporting fortnight. The 11.75 per cent 2001 and 12.5 per cent 2004 stocks remained among the favourite scrips. The interest in converted scrips has been on account of the older securities being on banks' investment portfolio and if banks trade in them they will have to provide for depreciation.

Later, during the second reporting fortnight the securities market saw heightened activity in sell quotes with little interest in buying. As a result, prices of the securities fell sharply and the yields increased by 50-100 basis points.

The downtrend in security prices inevitably pushed up the yield to maturity (YTM) structure (Graph C). The fall in security prices also entailed capital losses on stocks. As a result, the rates of return on government securities, especially longer-term ones, recorded declines. This made the prices and return on longer-dated securities more volatile. The SGL data as published by RBI bear ample testimony to these phenomena. For example, the price of 12.75 per cent 1996 GOI stock continually suffered losses during the month; it declined from Rs 102.85

(-) means no trading. YTM per cent = Yield to maturity in per cent per annum; CY per cent = Current yield in per cent per annum. * Yield rates of these sub-groups of t-bills and dated securities have been used for the graphs

Notes: (1) Yields are weighted yields, weighted by the amounts of each transaction

(2) Current yield has not been worked out for treasury bills

(YTM = 10.4 per cent) on November 30 to Rs 102.21 (YTM = 10.92 per cent) on December 12 and further to Rs 101.50 (YTM = 11.47 per cent) on December 20. Similarly, the price of 12 per cent 1995 security which was Rs 101.40 (YTM = 10.21 per cent) on December 8 below the face value of the stock to reach Rs 99.90 (YTM = 12.08 per cent) on December 30. This scenario is repeated in almost all other securities. The zero coupon 1999 bond faced continuous decline from December 5 onwards. The long duration securities, such as, 11.50 per cent 2007, 11.50 per cent 2008 and 11.50 per cent 2015 GOI stocks suffered considerable capital losses as their prices fell below their face value.

(b) Yield Curve Behaviour

A distinct fall-out of the current and prospective developments in the financial sector during December 1994 with severe liquidity strain, stiffening of the short-term rates and heavy demand for commercial credit, has been the distortion to an extent in the yield curve for government paper (see Graphs C and D). In fact an inverted pattern of yield curve has emerged towards the last week of the month of December 1994 with yields on 361-day t-bills overshooting those for dated securities at the latter's longer end of the maturity order (Graph D). Even at the stage of primary issues, the difference between the cut-off yields for 91-day and 364-day t-bills has been almost eliminated (Graph B). Interestingly, even the behaviour of the yield curve in respect of the dated securities (taking the average of the transactions for the month together or separately for the last week of the month, each as a surrogate for a point in time) does not appear to be a smooth one. Finally, there have emerged significant secondary transactions in state government securities whose yield curve do not show any serious distortion. A comparison of the averages of

the YTM's for central and state government securities is attempted in Graph E.

(c) PSU Bonds

Significantly, trading activity in PSU bonds remained subdued during the month. While tax-free bonds traded at an YTM of 9 per cent, taxable bonds fetched 13.5 per cent to 13.8 per cent in the secondary market.

(d) Commercial Paper

The commercial paper (CP) market had been dull following the October credit policy announcement which disallowed banks from automatically restoring cash credit limits at the time a CP matures. CPs were quoting at 12-13 per cent in the secondary market around the first week of the month. Towards the third week of the month the Reserve Bank issued a circular to banks setting a time limit of 15 days for considering the borrowers' application for renewal of cash credit limits. With this, there may be a renewed interest in this instrument. The market has already sent positive signals.

The need for having a short-term instrument in the market forced the players to look for newer avenues. Floating rate bonds (FRBs) with Revolving Underwriting Facility (RUF) and non-convertible debentures with such RUF were two such innovations introduced in the market during the month. Basically hedging instruments, these provided flexibility to issuers and investors in an uncertain interest rate scenario. The RUF gave the same comfort to issuers of FRBs and NCDs as that offered by a standby arrangement. In specific cases, the issuers issued less than two-year FRBs and NCDs and got them underwritten by banks for short term, say three months, duration. The bank would keep revolving this underwriting commitment every three months. The instrument thus has the advantages of both short-term as well as medium-term instruments.

In doing so, however, the issuers got away from both the regulators, SEBI and RBI - the requirement of credit rating of an NCD for above two years and the disallowance of underwriting of an issue by banks, respectively. It is understood that both the regulators are now considering how to curb this hybrid that is out of the regulatory framework. It is desirable that both the institutions reiterate their regulatory and supervisory concerns in this aspect.

(e) Certificates of Deposit

This instrument appears to have almost remained dormant during the past few months. While there was no interest whatsoever in the instrument for 91-day duration, one-year duration CD was quoted at around 11.50-11.75 per cent. Whether any trading took place at this rate was, however, not known. In any case, banks are not too enthusiastic about mobilising deposits ever since they have been on a spring-cleaning drive. In an otherwise dull CD market, there was, however, a sudden flash with the Corporation Bank deciding to issue a CD worth Rs 400 crore. Though reasons for the bank going in for such a large liability creation were not clear, it was certainly a move related to the growing liquidity crunch in the money market.

(f) Inter-Corporate Deposits

Inter-corporate deposits were available to P₁ companies for 30 days at 14-15 per cent, for 90 days at 15.25-16 per cent and 180 days at 16-17 per cent. The squeeze on the funds being raised by corporates through GDR route which had made the intercorporate market flush with funds over the past few months was indeed reflected in the firming up of the rates in this market. Funds which were available at 14-15 per cent were now costlier at least by one to two percentage points depending on the duration for which the funds were required.

End of Political Immobilism?

Ajit Roy

The assembly elections in Uttar Pradesh had opened a new path when, in a triangular contest, the Congress and the BJP were simultaneously humbled. The results of the latest assembly elections in Andhra Pradesh and Karnataka are significant for the confirmation of the historical advance of this yearning for a third force.

THE recently held polls for the four state assemblies which included the two major southern states of Andhra Pradesh and Karnataka have served to reveal some very significant shifts in the alignment of popular-political forces. This has in turn brought into sharp focus options before and criteria for choice by social segments and political actors. Theoretically speaking, of course, the long-term validity of the revealed trends is open to question, the next round of elections in five states in February may confirm, modify or even completely nullify them. But the prospects of their early nullification are rather unrealistic, as these shifts are the products of a long gestation period. It is rather more likely that the next Lok Sabha elections, whether held in early 1996 or earlier this year, will be strongly influenced by the political shifts revealed in the past round of polls.

The two most important revelations of this round of elections are: first, the erosion in varying degrees, of popular support of the Congress(I) in its recognised bastion, the two southern states of Andhra Pradesh and Karnataka, and, second, the failure of the BJP to exploit the division of the anti-BJP votes. Perceptive analysts have further noted or surmised two important shifts behind these two crucial developments, namely, (i) the Congress(I) has alienated a considerable section of its traditional support base formed by the dalits, adivasis and Muslims, (ii) the Muslim minority has opted for voting *en masse* for a third force *vis-a-vis* the Congress(I) and the BJP if and when adjudged to be a viable and credible alternative to the Congress(I).

All this in essence means that the immobilism that has been marking the Indian political scene since the Congress was worsted in eight states out of the then 16 in 1967 is perhaps coming to an end. For the last 27 years, the Indian people have been repeatedly trying to dislodge the degenerate 'Grand Old Party' of Indian politics. They have so far succeeded in this effort a number of times in the states and twice at the centre, but only in the dubious company of Hindu fundamentalist or Muslim sectarian forces. There have been exceptions, of course, as in West Bengal and Tripura wherein the Left

led by the CPI(M) has been able to cut an independent path to displace Congress rule. But this was successfully quarantined in the eastern zone. Only the previous round of state elections in Uttar Pradesh, the Hindu-Hindi heartland of the country, blazed a new path when in a triangular contest, both the Congress(I) and the BJP were simultaneously humbled. But it was considered to be more or less a singular achievement and the south was considered still to be a well-guarded Congress(I) bastion. The latest results in Andhra Pradesh and Karnataka are significant for the extension and confirmation of the historical advance of the yearning for a third force.

It is of course possible to exaggerate the significance of the Karnataka and Andhra Pradesh poll verdicts. The small number of seats won by the Congress(I) in these states is not a true reflection of its grass roots strength. In Karnataka, the BJP has annexed 40 seats to secure the second place in the house while the Congress tally is 36 only. But the Congress(I) got 26 per cent of the popular votes as against the BJP's 19 per cent. If the votes polled by Bangarappa's Karnataka Congress Party is added to the Congress(I) share, then the combined total would be only fractionally lower than the winning Janata Dal's tally of about 38 per cent. Hence, insofar as a shift in the consciousness of popular-political forces is concerned, the dominance gained by the progressive trend is only marginal.

The rout of the Congress(I) in Andhra Pradesh, however, is based on firmer ground. Compared with the previous assembly elections in 1989, the Telugu Desam Party (TDP) has increased its share of votes by about 7 percentage points to about 44 per cent, while the Congress(I) share has declined by 14 percentage points to about 33 per cent. In welcome contrast to Karnataka, the Congress(I) loss in Andhra Pradesh has not benefited the BJP at all, whose share remains unchanged at 3.4 per cent.

From another point of view, while the electoral gains of the Janata Dal and the Telugu Desam in Karnataka and Andhra Pradesh respectively represent in the final analysis their successes in forging a

broadbased alliance of popular forces which particularly include the dalits, adivasis and Muslims and politically articulate Left-democratic segments, the leading core in both the cases is formed by the middle caste and generally well-to-do farming communities, singly or in combination. In other words, although the humbling of the Congress(I) in this round of polls objectively represents an advance of democratic socio-political trends, the subjective consciousness and calculations of the leading forces of the winning formations are still generally ensconced in traditional idioms and digits of thought.

N T Rama Rao's promises of rice at Rs 2 a kg and complete prohibition in the state no doubt played an important role in mobilising the rural poor and the women voters. Even if these promises are dismissed by their critics as irresponsible and unenforceable populist gimmicks, they nevertheless stimulated justified and healthy aspirations of the masses and hence should be regarded as positive impulses.

Yet, the rejection of the Congress(I) in this round reflects little more than an elementary democratic consciousness on the part of the voters. The failure of the Communists in Karnataka, in spite of their linkage with a section of the INTUC, clearly indicates the absence of Left commitments on the part of the voters. This also indicates a non-committal stance of the masses towards the crucial NEP. Although neither the Congress(I) nor the Janata Dal or the Communists made the NEP a central or even major issue, the decline in the Congress votes reflects at least the absence of any positive attraction of the NEP for the people. This conclusion is not contradicted by the relative successes of the Communists in Andhra Pradesh which is perhaps the joint product of their alliance with the Telugu Desam Party and the decline of the Congress(I)'s appeal.

The rejection of Kanshi Ram's Bahujan Samaj Party by the Andhra Pradesh dalits, however, is not easily explicable. The party contested 262 seats to secure a meagre 1.26 per cent of the polled votes. All but a few of its candidates forfeited their deposits. In this state with its high caste tensions, this dismal record of the party claiming to be the liberators of the dalits cannot be the result of the latter's oversight or mindless reflex. The dalit masses were probably repulsed by the Bahujan Samaj Party leaders' lack of credibility due to their various infantile antics as well as the lack of viability of the party on account of the sharp polarisation between the two major contestants.

The shock of the latest round of elections has imparted many new impulses to the

entire body politic. It has led to new stirrings within the Congress(I) and outside and opened up new options for the parties and the people. It has, as foreseen, led to a destabilisation of some kind of the Narasimha Rao leadership within the Congress and adversely affected the creeping process of consolidation of the Congress(I) regime. This in turn has given rise to hopes for the emergence of a new centrist alternative to the Congress regime.

Capitalising on the shock and disquiet in the Congress(I) and its support bases, the latent and simmering power struggles in the party have come to the fore. Combined with the vigorous offensives of the more confident opposition in parliament, the pressures of the perturbed ranks of the Congress(I) parliamentary party have succeeded in ousting three of the most tainted ministers. More enduring in its impact is the dramatic resignation of the union human resources development minister and the most persistent challenger to the Rao leadership, Arjun Singh. The Congress, and the nation, may now be faced with prospects of a choice between these two chief contenders. In making the choice they should not overlook some of the basic issues involved.

Although he has all through his prime ministerial career been paying homage of sorts to 10 Janpath, no one can afford to overlook his thinly camouflaged struggles to come out of the tutelage. It should also be noted that the first plebeian in the seat of power in New Delhi on behalf of the Congress, that is, counting out the brief Lal Bahadur Shastri period, Narasimha Rao did initiate something like a weak glasnost, while Arjun Singh and some of his cohorts have not only been close to Madam, they can hope to upstage Rao only with considerable support from that quarter. This, at least initially, can only be a retrogression as it will certainly revive the grip of the imperial family on the power centre. It may, however, be argued, not without justification, that a short-term renewal of the 'Nehru-Gandhi' mystique may be conducive to its final extinguishment!

Further, while neither Rao nor Singh can be regarded as epitomes of cleanliness in personal conduct, it is not without significance that in the interest of power struggle the Rao clique did bring up the Bofors affair, while Arjun Singh's seven-page chargesheet against Rao raises many worthwhile and justified issues but skips over Bofors.

Arjun Singh surely scores plus marks over Rao on two points: first, in his demands for the correction of Rao's soft Hindutvavad and, second, alleviation of the adverse impact of the NEP on the poor and the marginalised. While credit should be his due for the first, the second is not substantially different from

Rao's own advocacy of a middle path. Moreover, the fundamental question about the NEP is not merely a further impoverishment of the poor. It is the comprehensive question of its pervasive and perverse impact on the nation's political and economic sovereignty and of safeguarding the country from an inevitable cultural and intellectual degeneration. Judged this way, the difference between Rao and Singh is not wide. Unless Arjun Singh can be pushed further so as to cut the tie-up with 10 Janpath and to call for a reversal of the policy of surrender to the process of globalisation under the auspices of the global MNCs and their agencies, the option will amount to almost a choice between tweedledum and tweedledee.

The choice for the Congress apart, the prospects of a choice between the Congress and a centrist alternative is obviously much more important. Judged by the present portents, the hope of reduction of the Congress to a small minority in the next Lok Sabha is not unrealisable. Indeed, it can very well end up with about 100 MPs,

that is, comprising about 70 MPs from the south as in 1984 and about 40 MPs from the north as in 1989. In order to make this a reality, the period from now on till the coming Lok Sabha elections has to be utilised for achieving three major objectives:

First, a broad consensus on national policies covering the entire range of issues among all the centrist forces, big or small.

Second, some solemn and firm commitment by the various aspirants for the top post to abide by a declared procedure for the selection of the person.

And third, a serious attempt to build up a Left consolidation as the fulcrum for the new line of development, the central thrust of which has to be a skillful but determined struggle against the process of globalisation under the global MNCs.

Unfortunately, with the Jyoti Basu line emerging triumphant in the CPI(M), there is no real possibility for the third requirement to be fulfilled. Hence, the coming period may perhaps witness a repetition of another, failed, Janata experiment.

UTTAR PRADESH

Fresh Life for Uttarakhand Movement

Amaresh Misra

The CBI report on the infamous Muzaffarnagar incident has put new life into the Uttarakhand movement – at a time when the Mulayam Singh government's record during its first year in office has come in for sharp criticism from all quarters.

THE new year in UP politics came in the form of another discomfiture for the Mulayam Singh government – the much awaited CBI enquiry on the infamous Muzaffarnagar incident was finally out. It confirmed what many independent organisations and political parties had been saying all along, that on the fatal day of October 2, when men and women of Uttarakhand were going to Delhi to attend a rally, they were stopped and brutally assaulted by the Uttar Pradesh police. Women were raped and men killed – the CBI report listed the number of the former at seven. The 'official' indictment put the nail on one of the most gruesome incidents in the recent history of UP, which Mulayam Singh and his partners in the BSP had done all that was in their power to deny or suppress. It exposed not only the abysmal human rights record of the government but also its history of fraud and manipulation through which it had tried to convert incidents like Muzaffarnagar, Khatima, and Mussoorie to its immediate political advantage.

The CBI disclosures have infused new life in the Uttarakhand movement, which after October 2 was becoming short on mass intensity. Political parties leading the movement have got a new stick with which to beat the government, and the coming days are likely to witness a new phase of the movement, this time on a more organised political basis. At the same time, whatever 'stability' Mulayam Singh was able to acquire after Muzaffarnagar has also evaporated and the chief minister is on the defensive. The whole issue has snowballed at a time when the government has completed a full year in office, and its record has come in for strident criticism from all quarters ranging from the press to political parties. The latter, ranging from the BJP to the CPI(ML), have all come out with their White Papers on the performance of the government which have highlighted, apart from the failure to fulfil poll promises, the raw deal given to dalits and the poor amongst the OBCs. The most backward sections, indeed, have started moving away from the ruling combine,

though their future course remains unpredictable.

The CPI(ML) document, besides pointing out the complete failure of the government to distribute land, ensure minimum wages and guarantee the self-respect of the dalits, also laid stress on some glaring anomalies of the regime. When it came to power, the sugar mills and government bodies owed crores of rupees to sugarcane farmers. This issue erupted as a major scandal during the last BJP government's reign, which led to firing on peasants and fervent advocacy of the issue by Mulayam Singh himself. Now, after a year in office the chief minister has yet to offer anything substantial on the issue, and the state and the private sector still owe more or less the same amount to the farmers, the majority of whom come in the category of small peasants.

Another issue which is causing serious concern is the growing power of the lumpen-mafia forces in the state. In fact, the implementation of the new economic policy in the state by Mulayam Singh has come practically in the form of reckless privatisation, benefiting those with hoards of black money, and the virtual 'liberalisation of corruption'. This, in turn, has unleashed anarchic forces in the economy and polity, the full impact of which will be felt in the days to come.

Yet, despite all this, any imminent threat to the SP-BSP government by means of a constitutional *coup d'état* looks unlikely. After the resignation of Arjun Singh from the union cabinet, the Congress is divided as never before in UP, with N D Tiwari also joining the anti-Rao bandwagon. The appointment of Rao's trusted aide, Jitendra Prasad, as the new UPCC chief, too, has not changed the situation – most of the Congressmen in the state remain opposed to Rao and the Mulayam Singh government, due to which Jitendra Prasad also stuck an anti-Mulayam posture. Yet, the high command's policy seems to be the same as before – that of opposing Mulayam Singh upfront while ensuring that his government does not fall. It is possible that in the coming days the Congress may well withdraw its support to the government, without however pushing things to a point where its survival becomes questionable. Mulayam himself is going to prove his majority on February 1 at the start of the new legislative assembly session, and in all probability he will survive the vote. The Congress will try to effect a boycott by its members, and if a crisis develops, a new polarisation in the assembly, with the OBC members of the BJP supporting Mulayam, can also take place.

For the Congress, however, the present turmoil in its ranks is less likely to subside. The revolt against the leadership of Rao is now no longer confined to any fringe group but has encompassed the majority. Things

are as yet not under the control of present UPCC chief, and there is a growing polarisation amongst Congressmen as regards its future in the Hindi belt, particularly in UP and Bihar where the party is facing a real possibility of irrelevance and marginalisation. The coming together of Jagannath Mishra, N D Tiwari and Arjun Singh with the covert backing of Sonia Gandhi is an attempt to revive the Congress on the old basis, by weaning away the upper castes from the BJP and winning over the minorities and the dalits by laying greater stress on the articulation of the OBC-dalit-minority plank. Once again, the national level crisis of the Congress is emerging with the Hindi belt as its focus, and future developments here will ultimately decide the way of the party in the coming days. At present, the battle is being fought in the best traditions of the Congress and within the strict limits of the party, but after the March assembly elections, the ongoing polarisation is expected to take a more concrete shape.

But whichever way the Congress goes, a peculiar state of animated stasis seems to be gripping the parameters of UP politics. The Mulayam Singh government, despite prospects of continued rule for at least some time, is hardly giving any impression of consolidation. It is also losing populist appeal, and the BSP too has almost completely lost its high profile posture. By all accounts, the SP-BSP government is ruling mainly because of the stalemate in the earlier polarisation which propelled it to power, and the fact of a lack of an alternative. That is why after one year in power it is giving the impression of neither moving 'forwards' nor 'backwards'. The BJP too is caught in the same bind, with neither new issues nor a political expansion coming to the fore. Amongst the left the CPI(M) as before continues in its non-functional state while the CPI also has not recovered from the political blow given by Mulayam Singh. This state in itself reflects the limits reached by the political balance of social forces in the last elections. The state is currently witnessing a powerful movement of employees which, despite all efforts by Mulayam Singh, has not shown any signs of breaking down on the basis of caste or other divides. In the near future, new issues are likely to arise in the mainstream political agenda, and political parties are gearing up for the challenge.

The month of March is going to be a month of rallies in the state, but political observers are keenly watching a proposed rally of the CPI(ML) in the second week of the month. After a long time a significant independent rally of the left is being held in the state; most of the previous rallies of the CPI and CPI(M) were either organised jointly by the centrist parties on the issue of communalism, etc, or were mainly pre-

electoral exercises. The CPI(ML) attempt is different because it is being held to open a space for a left alternative in the state at a time when there is a vacuum in the general left-democratic oppositional camp as well. The rally is attracting the attention of sections of the democratic intelligentsia, and a state-level organisation of progressive Muslims, the Muslim Forum, has also announced its desire to participate in the event. Especially after the infamous CBI raid on the premises of the Nadwa seminary in Lucknow, the student protest against which was led, incidentally, by the CPI(ML)-backed All India Student Organisation (AISA), the Muslim intelligentsia is also searching for an alternative. The Urdu press in the state took particular pains to highlight the involvement in the Nadwa affair of the AISA, which also led a 2000-strong gherao of Mulayam Singh on December 2 on the issues of unemployment, privatisation of education and free education to dalits. The gherao led to an unprecedented confrontation with the Rapid Action Force (RAF) which led to many injuries and was widely covered by the press. An interesting sidelight was the wide participation of dalit and OBC students in the AISA programme. Prior to this, in the last week of November the CPI(ML)'s women's wing, the All India Progressive Women's Association (AIPWA), also held a 1,000-strong rally (the first high profile programme of a women's organisation for ages in UP) in Lucknow, on the issues of equal property rights, 30 per cent reservations to women, constitution of a women's commission in the state and atrocities against women all over the state, particularly in Uttarakhand.

Karnataka: Elections and After

V K Natraj

Deve Gowda, the new Janata Dal chief minister of Karnataka, is a leader with a mass base, but where he will find himself tested is as a political manager. The vokkaligas and the lingayats have established a hold over the party, but how long the accommodation between them will last remains to be seen.

THE election results in Karnataka have shocked the Congress and at the same time confounded political analysts. While no one believed that the Congress would romp home as confidently as it had done in 1989 this dismal showing was not expected either. The principal factor behind the Congress's loss of face is its abysmal performance as the ruling party, which started in 1990 when Veerendra Patil was replaced by Bangarappa. More than preference for Janata it is a decided rejection of Congress and a stern warning to all parties not to take the electorate for granted any more.

In the last three or four years Karnataka has witnessed governments whose functioning has been, to be charitable, comic. Bangarappa's administration was full of massive shows of strength, scandals of corruption and whimsical transfers of civil servants with hardly any focused development strategy. Veerappa Moily, who succeeded him, secured the top post essentially because he hails from a minor community. It must have been thought by the Congress high command that soon after the Mandal judgment of the Supreme Court it would not do to have a chief minister from a dominant caste. This obviously carried little conviction with the voters. Within the party too dissidence was practically always visible.

Two major policy landmarks were attempted by Moily. The first was an attempt to control capitation fee in engineering and medical colleges. The government tied itself up in knots and admissions in 1993 were delayed for months. Ironically, the managements of private professional colleges went laughing all the way to their banks. Little was gained by this somewhat ill-thought-out intervention.

The second initiative of the Moily government was its attempt at reformulating the reservation policy which has been discussed by this writer in EPW (July 9, 1994). The quick succession of orders and amendments was truly mindboggling. At the end of the exercise the government could offer nothing by way of a substantial improvement on the Janata government's order of 1986 which itself was no shining example of intelligence. The chief minister, while not grappling with dissidence, was busy claiming that he and his government had rooted out corruption.

The distribution of party seats too produced more than a fair share of problems. Several rebel Congress candidates got elected. Efforts were made to woo them to the Congress fold so that it could be the official opposition party. Right now it has 36 MLAs against the BJP's 40. But this ploy failed. There are rumours of vast sums of money having been spent by Congressmen to defeat their own party candidates. Moily's analysis of the electoral loss was simplistic. He tried to suggest that his party lost mainly because of its principled stand on communally sensitive issues. Perhaps he chose to forget that even Gundu Rao who had led the Congress to its first electoral loss in the state in 1983 had not taken the party to such depths as he has.

Then there is the all-important question, what made the Janata Dal tick? JD supporters tend to argue that the results are a positive vote for the party, not merely a reflection of anti-Congress sentiment. It is suggested too that the Congress found the entire Muslim vote alienated from it. The latter point perhaps contains some truth, although it alone cannot serve to explain the JD victory. It is true that Muslims perceived the Congress as a backstabbing party with a deceptive secular appearance. Ayodhya apart, the Idgah issue in Hubli-Dharwad and the deaths resulting from the Urdu news rioting in Bangalore must have added their share of disaffection for the Muslims not voting Congress almost *en bloc* as they were earlier wont to. A significant factor was the unity which the JD projected. This was a big change from the scene a year or so ago when the JD gave every indication of being a house divided against itself. The coming together of Hegde and Deve Gowda in particular was a major positive factor for JD. And the party undoubtedly gained from not having been in power. Also, Hegde's plea to let the state unit alone was a wise move.

The BJP has done very well, jumping from just four seats in the previous assembly to 40 now. Too much should not be read into the fact that the party has won fewer seats this time than the number of assembly segments where it had a majority in the 1991 parliamentary elections. The electorate distinguishes between assembly and parliamentary elections rather better than many analysts. At least for the moment the

BJP is being perceived by the voters as a viable alternative to the other major parties. It appeals to the Hindu sentiment which is never absent in most people. It gains from the posturing of the pseudo-secular parties and leaders whose commitment to the cause of secularism is highly dubious. Not having been in power and being an organised outfit, the BJP appeals to the middle-classes' attraction for discipline and 'integrity'. Equally pertinent is the change in the complexion of the party. It is no longer a brahmin-dominated organisation. It is said that there is at least tacit agreement within the party in Karnataka that brahmins should be kept out of the party's higher echelons. It is likely that this has not yet permeated into brahmin consciousness but it helps in wooing voters from the major communities. There are only five districts where the BJP drew a blank.

What of the future? The JD, after some initial infighting, elected H D Deve Gowda as the leader. This makes political sense for a number of reasons. The vokkaligas have not had a chief minister since the formation of the enlarged state. Also to be remembered is that K Hanumanthaiah took a statesman-like decision by supporting the move for enlarged Mysore knowing that this would reduce his own caste (vokkaliga) to the second place numerically. Also Deve Gowda has campaigned tirelessly and is an able organiser. Hegde, a quintessential political being, did not contest the election. In fact he went underground mainly to avoid the pressures which would undoubtedly have been put on him from his supporters who are not small in number. Speculation was rife that despite not being elected, Hegde would be drafted as the chief minister, re-enacting what took place in 1983. Hegde appears to have made up his mind well in advance against this. He must have known that if he became chief minister he would be busy constantly fighting attempts to unseat him. It is said that during his chief ministership (1983-88) both Bommai and Deve Gowda never ceased conspiring to unseat him. Also, he would have seen the ripples which would have inevitably followed if Deve Gowda had been denied the top spot. Above all, he has his eye on the south block in Delhi. In fact it was this 'Delhi focus' which contributed to his dwindling popularity as chief minister. In the final analysis Hegde played a significant role in averting a showdown. What transpired was that J H Patel (now deputy CM) threw his hat into the ring. A frenzied mob of Deve Gowda supporters, suspecting that their leader was being shortchanged, created unruly scenes and forced its way into the secretariat. Much of their wrath was directed at Hegde who is often accused of being an ace manipulator, though in the present instance he was, if at all, manipulating in Deve Gowda's favour. Deve Gowda knew too that had Hegde tried

to become the leader he would have succeeded. He tendered an open apology to Hegde for the ill-treatment he was subjected to. A routine police enquiry has been ordered. The CM has stated that if his MLA son is proved to have been involved he will make him resign.

This was not a particularly auspicious beginning but there are other somewhat disturbing portents as well. Practically every cabinet minister has started making policy statements. The statements are often at variance with one another. There are of course the usual grumbings about allocation of portfolios as also about MLAs not inducted into the ministry. Most disturbing of all is the government's stand on reservations. It is stated that the government will revert to the government order issued by the Janata government in 1986 which hardly excluded any one. No formal order has been issued as yet. The party has also not covered itself with honour by making C M Ibrahim the president of the state unit. While a chaste

speaker in Kannada, Ibrahim has been a figure of controversy and does not enjoy a high reputation for probity. This is a rather brazen effort to please the Muslims.

Deve Gowda is a very hard working person. As PWD minister he was known for his command of his portfolio. He is a leader with a mass base but where he will find himself tested is as a political manager. The vokkaligas and Lingayats have established a hold over the party but how long the accommodation between them will last remains to be seen. Equally important is how the Hegde loyalists will act. The one saving grace may be that the ruling party does not enjoy a massive majority. That should prevent the sort of triumphalism which ruins parties which have runaway majorities. It is to be hoped that the new CM and his legislators appreciate this peculiar advantage. All that Deve Gowda has to do is to compare his party's performance during 1983-85 with that during the second phase

Such theological elaboration is anchored in the biologicistic Aristotelian world-view of gender identities and relations that believed that females are born from a defect in gestation wherein the male seed that normally produces only a male fails to fully form. The result is a defective human being or woman, naturally and biologically destined to be physically weaker and morally and intellectually inferior to males. This renders women unable to represent the fullness of human nature. She must be governed by males.

Writes feminist theologian Rosemary Radford-Ruether, "Drawing heavily on Aristotelian anthropology, Thomas Aquinas, a normative theologian for the Roman Catholic tradition, perceived the maleness of Christ as an ontological necessity and not just a historical fact. As males alone represented the fully human, Christ had to be male to be the collective representation or head of humanity. It followed that women could not represent Christ and as ordination conferred teaching and dominion over others, and women were considered incapable of this, they could not be ordained" ('Catholicism, Women, Body and Sexuality' in *Women, Religion and Sexuality* edited by Jeanne Beacher, WCC Publications, Geneva, 1990).

Radford-Ruether further writes, "... though this Thomistic tradition has long influenced theological perceptions on gender relations, including the question of women's ordination, recent official thinking has sought to retain his conclusions, without his premises. Women are now said to be banned from ordination, not because of any inferior status in nature or society, but because it is a 'sacramental mystery' - a special relationship with Christ. The historical fact that Christ was male demands that another male must represent him on earth, for symbols need to naturally resemble what they symbolise. Lurking insidiously behind the present teaching that women cannot be ordained because they cannot image Christ, is the traditional view that they lack fully human standing and personhood."

Juxtaposed against the traditional view are the views of forward-looking theologians who assert that women's subordination is not biologically but socially determined and that theology is culture bound, with mainstream theology providing a quasi-divine justification for unequal gender relations in society. It is inevitable, then, that Christian theology should be impregnated with patriarchal biases, mirroring the patriarchal mindset of biblical writers and theologians who were products of patriarchal social settings.

Says American feminist theologian Elizabeth Johnson, "Christ had to assume a physical form and live in certain time-space coordinates. If natural resemblance to Christ is so crucial to priesthood, all priests ought to be light-skinned, medium

Should Women Be Ordained?

Debate in Roman Catholic Church

Jean D'Cunha

The priestly ordination of women, which the Vatican firmly rejected through an apostolic letter last year, can only amount to fulfilment of Christian faith and practice, not a violation of it.

IN a brief but emphatic apostolic letter titled 'On Reserving Priestly Ordination to Men Alone', made public at the Vatican on May 30 last year, Pope John Paul II declared the Roman Catholic Church's decisive ban on priestly ordination for women - ironically, shortly after 1,300 women deacons were made eligible for priesthood by the Church of England.

Central to the defence of an all-male priesthood is the Vatican's assertion of Christ's choice of apostles from among men alone. In accordance with this, the church has always bestowed priestly ordination only on men: the exclusion of women from priesthood is consistent with God's eternal plan for the church. The Pope also reasons that "the fact that the Blessed Virgin Mary, the Mother of God and the Mother of the Church, received neither the mission proper of the Apostles nor the Ministerial priesthood clearly shows that the non-admission of women to priestly ordination cannot mean that women are of lesser dignity, nor can it be construed as discrimination against them" (text of apostolic letter quoted in *The Examiner*, Bombay, June 25, 1994).

The current papal position is bolstered by a traditional male-centred Christian theology that has legitimised an all-male priesthood on the grounds that God is male, that Christ

and his chosen 12 apostles were male, that it was a male Christ who redeemed humankind by his death on the cross and that this redemptive act of love expressed in the Holy Eucharist (i.e., the mass) is performed by male priests acting 'in persona Christi'.

It is further contended that while men are the heads of women, women are created as helpers of men, unendowed with authority and the ability to minister. For biblical references to corroborate this, is cited I Corinthians 11:3 which says, "Christ is Supreme over every man, the husband is supreme over his wife and God is supreme over Christ", or I Timothy 2:11-12 which reads, "Women should learn in silence and all humility. I do not allow them to teach or to have authority over men, they must keep quiet", and I Corinthians 14:34-35 which says, "Women should keep quiet in meetings. They are not allowed to speak, as the Jewish law says they must not be in charge. If they want to find out something, they must ask their husbands at home. It is a disgraceful thing for a woman to speak in a Church meeting."

The ordination of women, therefore, shakes the very fundamentals of the sacrament of Ordination, compromising Christian doctrine and creed, in the view of the traditionalists.

statured, long-haired Jews from West Asia, excluding dark-skinned, tall, short-haired men from other geographical settings. However, gender has been unfairly singled out as the only attribute of resemblance to exclude women from ordination" (interview with the author, 1993). Or as Radford-Reuther asks, "how have bread and wine, which surely do not look like a male human being, come to represent the body and blood of Christ in Holy Mass?"

On the question of god's maleness, which is used to bolster the all-male priesthood, progressive theologians such as Gabrielle Dietrich assert that god is neither male nor female, but an integration of both, transcending the gender dichotomy. Also, Christ's maleness does not exclude any individual - male or female - from the image of god or from equal participation in church life; doing so is a veritable transgression of Christianity ('Perspectives of a Feminist Theology: Towards the Full Humanity of Women and Men' in *God, Women and Bible*, Vol 22, No 3, Lagos, 1983). "Christ in fact came to liberate us from all forms of oppression, including patriarchal oppression. So to exclude women from ordination is hardly consistent with the liberating feminist perspective of Christ", says Sr Jeanne Devos of the ICM Congregation, Bombay.

Christ's personality was a rich combination of what are socially defined as masculine and feminine attributes. He was active, assertive, rational, intellectual, courageous and determined, but he was also loving, nurturing, gentle, compassionate, flexible and receptive. One can, therefore, argue that it really does not matter whether he is physically and observably male; for the whole process of becoming human involves providing equal opportunities to both sexes to develop their innate human potential, uncircumscribed by socially stultifying roles. Developing an androgynous personality like Christ is crucial for the development of richer human communities.

Further, biblical scholars maintain that Christ's progressive relationship with women defied the patriarchal environs of his times that perceived them as inferior, unclean, carnal and unfit to bear witness, a perception that consequently marginalised them from ecclesiastical participation, including ordination (Pearl Drego, 'The Feminist Point of View' in *The Emerging Christian Woman, Church and Society Perspective* edited by Stella Faria et al, 1984).

According equal value and responsibility to both sexes in his plan for humankind, Christ included women in his public ministry as his disciples and followers. He taught them, revealed himself to them and held theological discourses with them. In fact it was women - Mary, his mother, and Mary Magdalene - who demonstrated unflinching commitment to his cause, accompanied him

to Calvary and witnessed his gruesome death on the cross when the male apostles had retreated in fear. And it was to Mary Magdalene that the Risen Christ first appeared and entrusted the public proclamation of the ministry of his world, thus urging women's entry into public life.

Scripture scholars also maintain that women were certainly present at the last supper, as was the custom in those days, or else their absence would have been specified. Therefore, the Eucharist and Christ's permission to "do this in memory of me" was also given to women.

Vatican II's emphasis on gender equality, lay participation in the Church's Mission and the 1983 Canon Law Code providing for parishes to be run by women accountable to priests who visit the parish to celebrate the sacraments have opened up new pastoral possibilities for nuns and the laity, especially in the west. Assuming leadership positions within parishes, significant numbers of women are engaged in pastoral functions once considered the sacrosanct preserve of male priests - reading scriptures, preaching, counselling, distributing Holy Communion. The trend is sharpening with the number of those taking to priestly vocations shrinking fast.

A large number of nuns and laity in India too are engaged in such pastoral work -

healing ministries, distributing communion, visiting the ill, organising liturgical services, working in mission stations and in grass roots people's struggles. "In fact most church ministries engaged in by ordained priests - the Last Sacraments to the dying, for instance - require qualities of nurturance and sensitivity which are socially defined female traits... But ironically women have traditionally been marginalised from this, because they are not ordained", says Sr Jeanne Devos. "Also, decision-making rests with a male clergy, that competent but unordained women are marginalised from."

Gender equality, the concept of a Church of the People and full participation of the laity in Christ's life have been accepted in principle. Women successfully fulfilling several priestly functions have been accepted as a pragmatic solution to the problem of falling priestly vocations, especially in the US. Several other Christian denominations have ordained women ministers. Given all this, what is the legitimate rationale for the exclusion of women from priesthood?

Biblical scholars assert that if Love, Justice and Equality is the essence of Christianity and if we believe that both men and women are created equally in the image and likeness of god, then ordination of women can only be a fulfilment of Christianity - faith and practice - not a violation of it.

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Genes and the 'Moral Majority'

Carol Upadhyia

The ideological shift to the right in the US is being underpinned by certain trends in the social sciences and their popular dissemination. Two recent publications exemplify this.

THE recent Republican victory in the US elections is one outcome of a process of ideological shift to the right that has been taking place over the last two decades. There is still considerable diversity in political thought in the US, including a continuing liberal tradition and a small radical one, but it appears that mainstream America today is farther to the right than it has been for a long time.

This process is not simply a reaction to recession, unemployment, the crime rate and other such issues that concern Americans. Rather, there appears to have been a deliberate move on the part of a section of the intelligentsia to construct an ideological framework for right-wing policies, in order to lend support to the public's reactionary impulses and prejudices with hard 'facts' and respectable academic theorising and to give some philosophical and 'scientific' justification to elitist and anti-democratic political positions. There are two cases in point.

A recently published book by Charles Murray (a sociologist) and the late Richard Herrnstein (a psychologist), *The Bell Curve: Intelligence and Class Structure in American Life*, has spawned a controversy about IQ testing and its uses. It has revived the old theory that intelligence is innate and hence differences among racial and ethnic groups in IQ scores are genetically determined. The similar theories of Jensen and Shockley in the early 1970s used to be cited in psychology classes as examples of bad science (and of the uses to which bad science can be put), but Murray and Herrnstein have put a new twist on the debate. They argue not only that intelligence, or 'cognitive ability', is a single entity that can be measured by IQ tests and that is largely inherited, but also that intelligence has become the major determinant of success and hence of class position. American society is increasingly becoming a caste system based on IQ – the bright become successful and inter-marry, forming a genetically superior upper class, while the less smart are stuck at the bottom of the pile, reinforcing their low position by breeding among themselves, condemned to a life of crime and welfare. Although the authors are careful to dissociate themselves from a racist position, their theory clearly

implies that since blacks have lower average IQ scores than whites, they are bound to make up a large proportion of this underclass.

The authors go on to argue that since innate intelligence rather than social background is the most important determinant of poverty and of resulting social problems such as crime, 'illegitimacy' and drug dependency, there is little that government programmes can do to lift people out of poverty. Two chapters are devoted to arguing that affirmative action programmes should be curtailed, because the beneficiaries are inherently incapable of improving their situation. The book has fed into a widespread feeling that liberal social policies have failed because they are fundamentally misguided, and it provides 'scientific' justification for writing off the (largely minority) poor. The argument about genes and class also fits in well with the Republicans' proposed programme of reform, which promises to cut back on welfare to discourage poor single (mainly minority) mothers from reproducing. The authors of *The Bell Curve* contend that since the low-IQ 'underclass' is breeding at a faster rate than the general population, the average intelligence of the population is declining – an argument that gives further support to the abolition of welfare and which is eerily similar to that of the eugenicists of the 1920s and 1930s. The same Charles Murray, in an infamous report last year, called illegitimacy the "single most important social problem of our time", since all other social problems of the 'underclass' stem from this. He proposed that welfare be abolished and orphanages be built to house the children of unwed mothers on welfare – a proposal taken up by a few of the more rabid Republicans recently elected. (It is not by coincidence that Murray is a fellow at the American Enterprise Institute, a right-wing think tank.)

The second example is the publication of *The Moral Animal: Evolutionary Psychology and Everyday Life* by Robert Wright, a senior editor at the *New Republic*. Wright draws on the findings of evolutionary psychology to explain some aspects of human behaviour, particularly in relation to sex, love and marriage. Evolutionary psychology is a close cousin of the older field of sociobiology, whose theories have also been filtering into

the popular press in the US. The basic idea is that much of human behaviour can be explained by reference to the operation of genetic selection in human evolution. That is, certain behaviour patterns have evolved because they increased the individual's chances of reproductive success and hence of passing on his/her genes to the next generation. Behaviour patterns such as polygyny, incest avoidance, and violence among males are sought to be explained by reference to their adaptive features in some remote period of the human past. Similarly, evolutionary psychologists believe that natural selection has shaped the human mind and ingrained certain patterns of thought, affectivity and response that are universal.

Wright has taken these ideas and applied them to the behaviour of modern humans, as he sees it. In the realm of human sexuality, mate selection is not determined by 'love' or social custom but by underlying genetic urges such as that for males to produce as many offspring as possible, or for females to marry men who can best provide for their children. Human consciousness, social organisation and culture are mere epiphenomena; the real motivators of behaviour lie deep within our genes, out of reach of our conscious understanding. He also argues that our 'moral' sentiments – love, sympathy, benevolence have evolved because they helped our ancestors to reproduce successfully. Our real inner motives are hidden from us, and apparently 'good intentions' are really directed at achieving reproductive success. (The basic flaw in these theories, from the point of view of cultural anthropology, is that they lump humans together with other animals in assuming the priority of biology, rejecting the view that humans are fundamentally different because they have culture and language and hence learned behaviour is more important than genetic wiring.)

What *The Moral Animal* and *The Bell Curve* have in common is a theory of human nature that discounts intention and consciousness, as well as social and cultural environment, as factors in human action, and attributes behaviour to forces outside of human control – be it genes that make us act or IQ (genetically given) that determines life chances. The traditional social liberal view that we are the masters of our fate, that life can be improved with effort, is being over-run by a new conservative ideology that, paradoxically enough, seems to reject the notion of free will in favour of genetic determinism. It is interesting to see how science follows political mood. During the 1960s and 1970s – the heyday of liberalism – psychology was dominated by behaviourism, which emphasises the importance of environment and learning and discounts

innate behaviour. Now that conservatism is winning out, evolutionary psychology has come into vogue (behaviourism is out), along with an interest in intelligence testing. However, this sociobiological view of humankind fits into current political thought in a roundabout way. While Murray argues that 'biology is destiny' because IQ determines success in life, Wright's version is not that we are destined by our genes to be aggressive, promiscuous, or whatever, but that if we can learn what our 'real' human nature is, we can control it. Our 'natural' impulses (which lead to chaos) need to be curbed in order for society to survive. He says, "We are potentially moral animals... but we are not naturally moral animals. The first step to being moral is to realise how thoroughly we aren't."

Thus we come full circle via genes and abstruse sociobiological arguments to the 'Moral Majority' and the Republican

'Contract with America'. The vision that these two tracts summon up is frightening – it is easy to imagine how, backed by the authority of science, the state can suppress and terrorise the poor by taking away their children, force them to work in low-wage, dead-end jobs, and deny them any opportunity to advance by labelling them genetically inferior. The hegemony of the few at the top is reinforced by economic and social policies, and the masses in the middle are controlled through laws that enforce conservative 'morality'. Conservatives rail about big government, but it seems that the state is about to become more powerful than ever. This evolving American ideology, its dissemination through pop psychology books and TV talk shows, and its connection with the new political agenda, need to be carefully followed and analysed by concerned thinkers and academics.

aim, whatever may be said to disguise it, at the sovereignty of nations... The plan of action proposed by the Americans talks about reducing the birth rates of less developed countries by 10 per 1,000." This perception was shared by many of the delegates attending the Bucharest conference.

During the first international development decade, observed in 1960s, the phenomenon of mass poverty was conceptualised as 'underdevelopment'. United Nations classified the countries with per capita income of less than one-tenth of that of US, as underdeveloped countries. Thus 70 per cent of the populations of the world lived in underdeveloped countries. It was argued that exporting the western development models, giving financial aid, transferring science and technology, would bring about 'trickle-down' effect and the poverty will slowly vanish from the face of the earth. Under this thinking the international penetration increased dramatically. Among these is the example of the Green Revolution technology. However in the 1970s the fallacies of these development concepts became visible. For example, experience with Green Revolution showed that the better placed farmers benefited more. Lower strata of the peasantry frequently lost land and the ranks of agricultural labourers expanded. Food stocks grew not only because of the increase in production but also due to lack of buying power of the poor. Developed nations experienced ecological crisis. Also introduced were labour-intensive, export-oriented industries (mostly based on multinational investments), especially in electronics, garments and toy-making. These have been a major form of employment of women in the countries of south-east Asia. Such employment, searching for young, unmarried women with 'nimble fingers' has been very exploitative in terms of low pay, low job security and sexual exploitation. Researches on women's conditions carried out at this time clearly brought to light women's marginalisation in both developed and underdeveloped countries. In the west the period of reconstruction and expansion of capitalism had led to the increasing disempowerment of women in the societies. In the third world, privatisation and destruction of resource base took on alarming proportions posing a direct threat to the survival of the poor masses and implicitly to vast sections of women.

Findings of a large number of researches acknowledge that despite substantial economic growth and certain shifts in the socio-economic structure, the overall situation of the poor, at best, had been stagnant and was deteriorating among those

Politics of Population at Cairo

Malini Karkal

Although the plan of action approved at the Cairo Conference on Population and Development shows the influence of the international women's movement and the issues it has raised, it fails to tackle the crucial question of inequitable development between the north and the south.

THE International Conference on Population and Development (ICPD) was held at Cairo, Egypt, in September. This is the third conference in a series of conferences that have been organised by United Nations Fund for Population (UNFPA) and held at an interval of 10 years. First conference was held in 1974 at Bucharest, Romania, and second in 1984, at Mexico City. However these conferences were preceded by two other conferences organised by the International Union for the Scientific Study of Population (IUSSP) with the assistance of UN. First of the IUSSP conferences was held in 1954 at Rome, Italy and second, at Belgrade in 1964. IUSSP conferences were essentially academic discussions on the subject areas under the theme of population. Inter-relationships between socio-economic conditions and population were discussed as a part of academic interests. No discussions took place to manipulate population size. Politicisation of population issues, in the UNFPA-sponsored conferences is indicated by the fact that at Cairo IUSSP, an association of the professionals in the field of population and which participated as an NGO arranged a

special function to felicitate Nafis Sadik, secretary of the conference.

It is significant that Bucharest and Mexico conferences were called 'population' conferences, however the concerns that animated the debates at both these conferences were centred on the bearing of population on social and economic development, the main concern of the meeting at Cairo. The Cairo conference was titled 'Population, Sustainable Development and Sustained Economic Growth'. During the period between Mexico and Cairo, feminists were active in expressing their stands on the population issues. Women, especially those from the south, raised issues of poverty, consumerism, promotion of hazardous contraceptives and the neglect of women's health, especially reproductive health. Cairo conference, therefore, had greater influence of women's issues and it discussed subject like sexuality and reproductive health and abortion. Before Bucharest conference eminent Frenchman, and a demographer said, "The political gathering will be led, kept in motion, directed and controlled by the United States. At Bucharest, a world population plan of action will be proposed that will take

closer to the bottom of the social ladder, especially the workers in the traditional and informal sectors and women. The richest 25 per cent of the population of the world receives 82.7 per cent of the world's income, whereas the poorest 25 per cent has to do with a share of 1.4 per cent.

There are some overriding features in the development concept which interlink the perpetuation of poverty, the marginalisation of women, and the destruction of environment. There is also deterioration in the cultural field. Women's rights are threatened from two ends. On the one hand religious revivalism, fundamentalism and communalism encroach on women's free spaces. On the other hand, the new avenues of freedom opened up by capitalism go along with massive objectification and commercialisation of women's bodies and violent assaults on their physical and spiritual integrity. Both these tendencies are rooted in a development model which perpetuates and deepens poverty and marginalises women.

In the decade 1962-72, a series of resolutions on population were adopted in the governing bodies of the UN agencies. The leadership was provided by the US and resolutions were initiated and supported by western and some of the Asian countries, who argued that rapid population growth was a serious impediment to development and that family planning programmes were urgently needed. This view met with considerable opposition and resistance from Catholic, Socialist and African nations. The resolutions passed by the inter-governmental bodies of the UN gradually legitimised family planning and established it as a human right, obtaining the co-operation of governments in the provision of family planning services and ultimately finding acceptance for the notion of targets to limit population growth as a part of development policy. Each of the major functional agencies – WHO, UNESCO, FAO, ILO, and the World Bank – acquired mandates that roughly paralleled those emanating from the UN.

The third world countries attributed the disparities between them and the developed countries to their disadvantaged position in world trade and to the economic policies of the rich countries towards them. Five months prior to the Bucharest, at the initiative of some of the third world countries, sixth special session of the UN was called at which the declaration on the establishment of a New International Economic Order and an associated programme of action (POA) was accepted. The programme touched upon the third world concerns, including raw materials and primary commodities, food, trade, the international monetary system, industria-

lisation, transfer of technology, multinational corporations, strengthening the UN system and special assistance to developing nations unable to cope with problems of development. It was decided that the World Population Conference at Bucharest should be directed to the efforts to establish a New Economic Order. No mention was made of the demographic issues of 'population' and its consequences on development.

During First and Second United Nations Development Decade, industrialised countries had pledged to greatly increased aid to the third world countries. However in reality they had decreased the percentage of their GNP that they allocated to the development assistance, making the poor countries feel that the west was not interested in their plight. The US had made population growth in the third world into an American cause. The US had reduced development and had boldly assumed world leadership in the population movement and given it a distinctive American identification.

Most of the hopes and expectations of the population lobbyists who had taken the lead in convening the Bucharest Conference were embodied in the Draft World Population Plan of Action (POA). However, at Bucharest, the third world countries were well organised and opposed the official draft resolution that was designed to promote American interests. The draft plan came under intense conflict and difficult negotiations. Midway through the conference, many delegates and even members of the secretariat openly acknowledged the real possibility that the conference would adjourn without the plan being approved. Some 300 amendments were introduced and debated. The final version of the World Population Plan of Action was a product of strained compromise. The draft plan had undergone extensive changes in spirit and substance, especially in the provision relating to fertility and population control. The draft plan had as its purpose "to affect population variables". The final version stated its purpose as "to help co-ordinate population trends and the trends of economic and social development". The Draft Plan stressed the need to limit population growth through implementing population and social welfare policies with direct effect on fertility. The final plan, by contrast, conveyed a strong sense of urgency about the need to accelerate socio-economic development in general and to bring about a new and more equitable international economic order. It urged the developed countries, who had high per capita use of resources, to adopt appropriate policies in consumption, bearing in mind the need for

fundamental improvement in international equity. The Bucharest conference brought into circulation a new phrase, 'development is the best contraceptive'.

The background section of the plan clearly indicated the attitude of the majority of delegates at Bucharest that 'population problems' are really symptoms of imbalances in the development process, which are in turn, a consequence of the international economic system. The US along with most other western industrialised nations is simply not prepared to accede to the radical transformation of the international economic system as proposed by the developing nations. The demand for a New International Economic Order was ideologically objectionable as well as a threat to American wealth and power. From the American perspective, it was an attempt to improve economic conditions in the third world by redistributing the existing wealth of the industrialised nations rather than by creating new wealth through development. At Bucharest it was stated that family planning programmes were needed, because they satisfied needs to which people were entitled as human rights. A human rights rationale promised to make the programmes less politically sensitive.

In spite of the decisions at Bucharest, during the period intervening between Bucharest and Mexico the population control programmes were promoted vigorously. In 20 years preceding Mexico, the US had pushed population policies in the developing countries harder than any other western country. It had strongly supported the demographers to contribute to the population research and medical science to develop contraception. Through the Office of Population of the Agency for the International Development (USAID) was mounted a largest population assistance programme and a corps of 60 professionals was maintained at Washington, with advisors in more than 40 countries and support for family planning in 90 countries. The countries that accepted population control policies received aid from the US government for a variety of social and economic programmes.

In Mexico, the developing countries no longer spoke of international population assistance as racist, genocidal, or imperialistic, or accused western countries of advocating population control as a substitute for foreign aid. More and more of the poor nations had come to 'realise' the problems of rapid population growth, infant and child mortality, urbanisation, and migration to be addressed with or without the major transformations in the world economy. The declaration accepted at the end of the Mexico Conference was

Status of Panchayati Raj in the States of India 1994

General Editor
George Mathew

With the adoption of the 73rd Constitution Amendment, panchayati raj has attained statutory status with all states in the country enacting legislations in conformity with the amendment. What is the history, tradition, structure and functioning of the panchayats in various states of India? What is the status of the local government institutions on the eve of the new panchayati raj system coming into force? These and various other pertinent questions are answered in this book containing twenty-five chapters – one chapter for each state – written by senior officials and academics from the respective states, backed by an expert research team of the Institute of Social Sciences. With maps detailed data about districts, socio-economic profile of each state and an introduction tracing the historical evolution of panchayats in the country from the earliest times, this book gives in one volume all one would like to know about Panchayati Raj in the states of India.

in close conformity to the official draft. There was a strong endorsement of the principle that the governments should as 'a matter of urgency' make family planning services 'universally available'. The Declaration also added that "social and population pressures may contribute to the continuation of the wide disparity in welfare and quality of life between developing and developed countries."

At Mexico, in 1984, the relationship between population and development still occupied centre stage, but was debated in a frame quite unlike that at Bucharest. The 88 recommendations of the plan of action added emphasis and urgency on concerns with the environment, the role and status of women, meeting 'unmet needs' for family planning; and education. It also added that, "The experience of the last decade has demonstrated... (that) lack of definite commitment, inadequate resources, ineffective co-ordination and implementation and insufficient data, have limited the effectiveness of governments in the implementation of the national population policies." At Mexico, the US talked of development at large and developing countries tended to see it as the main actionable issue on the agenda. Social and economic development was accepted as a central factor in the solution of population and inter-related problems. Population factors were considered to be very important in development plans and strategies and had a major impact on the attainment of development objectives. At the conference it was accepted that the US provided the single most important source of leadership and resource for international population programmes.

At the Prep Com II of the International Conference on Population and Development (ICPD), before Cairo, held in May 1993, Sadik stated that "the mandate of the Conference is to produce a document on the full integration of population concerns into the economic and social activities and sustainable development." She added that there was a need to set goals to reduce infant and maternal mortality, for increasing life expectancy and literacy, and for lowering the global fertility rate from 3.26 to 2.62 births per woman by the year 2015. Sadik emphasised the need to 'rectify' the failure of UNCED, the conference on environment held at Rio, to address "the place of population within economic and environmental sustainability."

CAIRO CONFERENCE

Cairo conference was not just a meeting of the officials to take decisions but a process that was a culmination of over

three years of consultations around the world. There were three preparatory committee meetings of the governments that were convened at the UN headquarters. Second, five regional inter-governmental conferences were held in Africa, the Arab world, Europe, Latin America and the Caribbean, and Asia and the Pacific. Third, six expert group meetings on various themes such as population and environment, population and women and family planning, health and family well-being were organised. The UN and most of its member governments are increasingly open to co-operation and collaboration with non-governmental organisations (NGOs). The turning point was when 1,420 NGOs attended the 1992 UNCED conference on environment using an accreditation process that has been emulated in a series of related, major conferences – Conference on Human Rights held in Vienna, Cairo Conference on Population, Conference on Social Development scheduled for March 1995 at Copenhagen and the Conference on Women scheduled for September 1995 at Beijing. UNFPA and other funding agencies funded several regional meetings in countries where NGOs discussed population issues. More than 100 governments drafted national reports on population which were used by the ICPD secretariat to draft the document for discussion at the conference. The draft plan was a hefty document, well over twice the combined length of its two predecessors. On the whole there was a far greater involvement of the general public in the discussions on population.

Discussions at ICPD Cairo had a major bias of the interests of the developed countries. Shortages of labour force due to low fertility for long durations generated conditions of migration of labour from the developing countries. Today substantial populations from these other countries live in the developed countries. Permitting migrations of the dependents of these migrants with the objective of reunification of the family is not in the interests of these host countries. The migration issue tackled at Cairo protected the interests of these countries. The same was the situation with the issues facing indigenous people. The resource crunch felt especially by the developing countries was completely ignored and there was no discussion on consumerism in the developed countries nor on environmental damages.

In a departure from previous international population conferences and the experience at Bucharest conference of major disagreements and serious discussions which generated fears of the conference delegates dispersing without any agreed document, the rules drafted at

the Pre-Com III, stipulated that the work of the conference and the adoption of its report were to be accomplished by general agreement rather than consensus. The UN General Assembly, held in July 1994, approved the rules of the conference. It was also convenient that much discussion would take place on issues such as abortion, sexuality, new forms of family, etc. This not only diverted attention from the issue of development but it created strange bed-fellows – like the Vatican and Muslim fundamentalists. Latin American countries with their strong Catholic background and Arab and Asian countries that have strong Muslim influence raised similar objections. African countries, less obsessed by religion found themselves aligning with western and east block countries. On these issues women – and majority of them represented interests of southern countries – had to support developed countries.

Official delegations of about 180 countries participated in the conference and estimated NGOs numbered 1,200 to 1,500. The number of participants at the NGO meets was larger than those in the official meetings. While the NGO delegations were dominated by women, the official delegations had a majority of men. G-77 represented the interests of the 130 developing countries. Journalists – estimated to be around 4,500 – were very active and modern facilities helped them in their job. Unlike most international conferences, which inevitably become a north-south tug-of-war, the ICPD, with its religious and cultural undertones, cut across traditional alliances. Over 14,000 security persons guarded the delegates and assured smooth functioning of the proceedings of the conference.

In comparison to the two previous plans of action, accepted at Bucharest and Mexico, the Cairo Draft showed a definite expansion in the concern of the international population community with the health dimension. However, the health policy fell short of concern for the health of the adults and of the elderly. Major interests and contributions of the Cairo Draft were in the area of reproductive health. An overwhelming focus is on sexually transmitted diseases with more general concern for reproductive tract infections, to the neglect of other important conditions. This is likely to have happened because such conditions are associated with infertility, cervical cancer, certain adverse outcomes of pregnancy and HIV transmission, and they also have socio-economic costs related to treatment of the disease and to impact of the disease on functioning and status. Another reason for the overwhelming focus on sexually

transmitted diseases is probably the growing attention given to AIDS because of its increasing prevalence and its devastating consequences in developed and developing countries. The Cairo POA recommends comprehensive reproductive health services within a primary health care delivery system. Expansion of services will certainly be resisted by the family planning establishment both on the basis of cost implications and because of the dominance of vertical service approach that gives priority to family planning service over all others.

Although focusing attention on health service intervention, the Cairo document fails to look at women's health holistically giving due attention to the factors that condition and constrain the health situation and the health-seeking behaviour of women. The POA gives consideration in the section on reproductive health to gender relations as one aspect of social context in relation to sexual health. However, other aspects such as women being socialised to accept morbidity in silence should have been taken into account in attracting women to use health services. Women's perception of self also needs to be considered, as women give priority to the needs of others over their own needs. Other aspects such as the heavy work-load on women, particularly in rural areas, together with the increasing constraints of low status and poverty that prevents women from using health services should also have been considered. On the whole there is absence of articulation of issues relating to the health of women in the population policy. The population establishment deals most directly with medical interventions forgetting that these interventions are subject to perceptions and behaviours that are deeply rooted in social and cultural realities.

The main committee of ICPD had glossed over the question of equitable development and supported the northern agenda of population control. Many southern governments whose ruling elites now espouse the modern consumerist life style of the north also adopted the same attitude. Southern NGOs, therefore, dismissed the claims of some of the delegates at the main conference that the conference was a victory for women whose 'empowerment' is the cornerstone of the emerging ICPD document. Southern NGOs categorically maintained that the emphasis on population control measures pinned the blame squarely on the women of the south, when in fact these problems stem from the inequities between the north and the south and exploitative transfer of resources which has led to over-consumption and global environmental degradation. The

programme of action, they said, therefore is nothing but an insult to women, men and children in the south who will receive an ever growing dose of population assistance, while their issues of life and death will wait the Social Development Summit of 1995. Though development was a component of the theme of the conference much time was consumed by the sections that were bracketed (not agreed upon at the drafting stage). Efforts were made to arrive at acceptable wordings and in most cases they were interpreted differently by participating delegates. The decisions on matters related to development were virtually excluded from the discussions. There was a complete absence of discussion on the existing inequities between the north and south and the unequal and exploitative transfer of resources that has led to over-consumption and global environmental degradation. Population growth in the north with its consumption pattern is a greater threat to the planet. Issue of debt of the third world countries, that has influenced the global economic system, and resultant drastic cuts in the government spending on social services and falling living standards and unemployment, were also not discussed. It was generally said that the issues of development will be discussed at the conference on social development scheduled to be held at Copenhagen in the beginning of 1995. Similarly besides talking of the rights of education of

women, and their rights of employment, there was hardly any discussion about the issues of women. And these were postponed to the conference on women to be held in September 1995 at Beijing, China.

The financial requirement of the POA is about \$ 17 billion by 2000 and \$ 21 by 2015, an amount far less than what UN approves at other deliberations. Two-thirds of this is to come from the developing countries and the remaining from the industrialised nations and the multilateral institutions. Population assistance programmes, to which Reagan and Bush administration gave a rather low priority, are receiving strong support from the Clinton administration as well as the Congress. USAID has voted a population assistance budget of \$ 392 million for the 1994 fiscal year (an all-time high), which includes \$ 40 million for the UNFPA. Additional funds earmarked for population assistance through other programmes raise the total to the half billion dollar mark. Funds for the previous year, FY1993, have already been forwarded to three international agencies that had their US funding cut-off in 1985 (under the Reagan-Mexico City Policy) \$ 14.5 million for UNFPA, \$ 2.5 million for the International Planned Parenthood Federation (IPPF), and \$ 2.5 million for the World Health Organisation's Human Reproduction Programme (WHO-HRP).

COMPLEMENTARITY IN TRADE AND PRODUCTION Intra-South Potentials

V R PANCHAMUKHI, R G NAMBIAR, RAJESH MEHTA,
G A TADAS and S K MOHANTY

Economic cooperation among developing countries has been strongly advocated in recent years as an appropriate strategy for development. Despite efforts over the last two decades to encourage it, the pace of South-South cooperation has been slow and its full potential has not yet been realised. One of the main reasons is that the benefits of and the potential for strengthening cooperation are not generally known. It is, therefore crucial to identify the potential of economic complementarities and ways and means of taking full advantage of them. This study focuses on a number of important issues pertaining to the broad area of complementarity in trade and examines the potential for expanding trade among developing countries.

New World Order and Indian Intellectuals

Daya Krishna

Countries pursue their own interests the way they perceive them and it is for others not to be deceived by the rhetoric. To understand the interests that are masquerading as values, what is required is a detailed study of the economy, polity and culture of the western world in general and the US in particular, for these are the main protagonists in the contemporary scene without understanding whom we cannot shape our own policies to meet their strategies.

A NEW imperium is taking shape - an imperium, more total and more global than any that history has seen uptill now. It is backed, perhaps for the first time in history, by organised information and knowledge and skill that has seldom been seen in the past and though it has an unthinkable coercive power at its command as was evident in the war with Iraq a few years back, its basic strategies for achieving the imperium are primarily economic, cultural and even moral. It has also a political facade in that it does not directly seek to achieve the new world order as it wishes it to be but does so through the institutions and agencies of the UN which ostensibly is a world body where each sovereign nation is supposed to be represented and whose decisions, thus, are supposed to represent the decisions not of any one country but of the world as a whole in its totality for subserving the interests of the world and not those of any particular nation or group of nations. The pressures exercised for achieving these aims are primarily economic, but they are also increasingly marked by a rhetoric in which legal and moral values play a crucial role so that it becomes difficult for anyone to question them on those very grounds. The violation of human rights and the demand for non-proliferation of atomic weapons are the two obvious examples but there are many others such as the treatment of minorities, the suppression of the demands for regional independence, freedom in the sense of non-restriction of terms of trade and other such matters.

However, behind this plea for a moral order of the world which ought to be imposed by economic sanctions and, if need be, by military sanctions also, is the sheer self-interest as conceived by those who are most vociferous in voicing these concerns as, when it comes to their own behaviour, they forget those very values which they want to impose on others. Everyone knows, for example, who brought the nuclear weapons into being and who first used them even when it was not militarily necessary to do

so. Or, who has continuously violated animal and human rights in their own countries and with respect to their own peoples till very recent times even in the way these values were conceived and defined by themselves. The fate of the Red Indians in the US is well known and so also the discrimination against the blacks and the Jews till almost the other day when it was difficult even for students with outstanding abilities to get admission to prestigious universities just because they happened to belong to these groups. The discrimination against women was no different, as any history of the struggle to achieve such equality on the part of the under-privileged would amply show.

The story, of course, does not stop here and no one knows better than the leaders of those countries as to how the economic needs of the armament industries have fuelled military rivalries between nations elsewhere so that obsolete armaments may be sold to them and thus the sagging profits of those industries propped up. The case of Bofors in India is well known but there are many others which can easily be found if one chooses to consult the easily available relevant data concerning these matters.

But there is nothing to be surprised at in all this, as countries pursue their own interests the way they perceive them to be. It is others who should be aware of them and not be deceived by the rhetoric in which they are couched. Once we know the interests that are masquerading as values, we would treat them as such and know how to meet them in terms of our own self-interest. But for that it is necessary that we become aware of the way the contemporary world is developing and the interests and the motivations of each of the major actors on the world stage. For that, what we require is a detailed study of the economy, polity and culture of the western world in general and the US in particular which are the main protagonists in the contemporary scene and without understanding whom we cannot shape our policies to meet their strategies.

The west therefore needs to become an object of study so that we may know it more fully just as we ourselves, along with all other non-western nations, have been an object of study to it for a long, long time.

It is true that the west resents such a reversal of roles even at the cognitive level. Levi-Strauss's famous remark in his lecture at the Smithsonian in the early 60s that "the symmetry in such cognitive enterprises was not a children's play which could be undertaken by any society with respect to another so as to make it an object of study. A society must also become an object in the sense that it is conquered, subjugated or made subservient to the other". Much water has flown since Levi-Strauss argued this position in a brutally frank manner but, perhaps, the internalised attitudes of both the parties have not become much different from those days. This is reflected in the fact that while there are numerous studies on the non-western world by western scholars, there are hardly any studies of the contemporary or even the classical west by scholars of non-western origin. Each year hundreds of scholars from the western world come to study the non-western cultures in all their aspects while those who go from the latter to the west do so primarily to be taught and learn the conceptual structures and methodologies from them and not to study them. A Srinivas goes to Stanford and writes about *A Remembered Village* in India just as a Dube had done long back in Cornell where he wrote his well known book entitled *An Indian Village*, but the startling fact is that nobody is surprised or shocked at it.

We had more than 200 years of British presence in India and more than a thousand years of effective presence of Islam in this country and yet studies, either of British or Islamic civilisations, would hardly be found to have been done on any significant scale by any Indian scholar during this long period of their presence in this country.

Conversely, the number of works produced both by British and Islamic scholars are not only numerous but relate almost to all areas in which this civilisation had been active for a long time. Even the number of translation from Sanskrit and other Indian language into English is incomparably more than we have from English into Sanskrit or any of the other Indian languages. The situation was no different in earlier times when we have recorded evidence of Indian texts being translated into Arabic and Persian by scholars in west Asia and by Chinese and others into the language of their own country. There seems to be something in the Indian culture which stands in the way of its intellectual taking an active interest in the 'other' particular if the 'other' happens to belong to another civilisation, culture or religion.

ASHISH 8/81, Punjabi Bagh, New Delhi - 110026 (India).

Send your orders to:

Ashish Publishing House,

The continuance of such an attitude in the contemporary context will have as disastrous a consequence as it had in earlier times. Today, of course, we have the illusion of knowing the west, particularly because of our knowledge of English and what is available in it from other languages through translations. But this 'knowledge' is knowledge only in a superficial sense as it does not encourage in us the active intellect which is the hallmark of real knowledge, in that it both encourages and challenges us to think for ourselves and add to it further. The truth of this statement may be made evident to anybody by asking him to reflect, even cursorily, on the fact that all the additions and innovations in this 'knowledge' that we are supposed to possess have been made not by us, but by those from whom we originally borrowed this knowledge. And this is true not only in the field of knowledge, but also in the field of technology which we continue to borrow while those from whom we borrow continue to innovate and make advances in it so that we are obliged to borrow again for fear of being left behind with a technology which has become obsolescent and is hardly competitive in the contemporary world.

One may say that the situation is not exactly what I am trying to suggest it to be. Aren't there, for example, a lot of 'American studies' in this country? And don't we have in fact an American Studies Research Centre in Hyderabad equipped with one of the best libraries in south Asia, and don't scores of students every year go there to do research on American subjects in an atmosphere which is congenial for research? This all is, of course, true but when we look a little closer at the areas of research undertaken and the type of research done and compare it with what the American students have done on India during this very period, we will realise that the very idea of 'research' in this country is different from what research means in the west these days. First, most of this research is confined to the field of American literature which can more easily be done from texts and critical sources available in a library. There are hardly any studies of social or political institutions which require a personal acquaintance with the reality concerned and which will involve going to the US to study them. In fact, one of the reasons why students from the west have to come to India and other non-western countries for 'study' is because a living acquaintance is considered absolutely necessary for 'knowing' about such matters as they cannot be grasped just by reading textbooks on the subject. The 'living reality' of a society or culture generally does not coincide with what one reads about it in a text. In fact, many a time, it is just the opposite of it. And, if one sees the thrust of the empirical and even textual studies done by the students from the west during the last two or three decades, one would find that it is concerned with the

creation of a new 'picture' of India which is totally at variance with the picture that Indians have of themselves or which they would like to have. It is both the images of the past that most Indians cherish and the future that they would like to build which is under attack through one of the subtlest cognitive strategies that perhaps the world has even seen, for what is said is not untrue, but only half-true and skewed in a direction which, mostly unconsciously, helps the current interests of the imperium in the making.

The ideologues in the US on the other hand, are already urging their rulers not to be inhibited by older ideologies and value-systems in assuming the role which history has provided. The idea of non-interference in the sovereignty of other nations' internal affairs is considered as outmoded and it is being urged as 'legitimate' to impose the new 'unequal' world order where access to certain kinds of knowledge, technology, arms, resources and markets are to be a monopoly of only a few and, ultimately, perhaps only of one. To impose sanctions against those who do not fall in line is the new 'divine right' of these rulers.

What we need first, therefore, is a change in the perspective of Indian intellectuals so that they become interested in other cultures, politics and civilisations, particularly in the

context of the way they perceive the world in terms of their own interests and their view of what 'others' are and the way they want their relations with them to develop. This, of course, presupposes a wide-ranging interest and curiosity about that which is different from oneself; but in the context of a world which is politically and economically competitive, mere interest and curiosity will not suffice. What will be required is detailed information on and analysis of the strength and weaknesses of the other and an understanding of the way its interests and values clash with those of one's own and where they converge, perhaps against some other polity or society or civilisation. But, as everyone knows, this is a vicious circle and the task of the thinkers is not to deny the fact of the circle being there, but to find a way of getting out of its viciousness while the actual politicians would more or less have to live with it and in it.

The world of politics or trade is not a happy one for anybody who is seriously concerned with the realisation of values in this world but in the contemporary situation where, whether one likes it or not, one has to be a citizen of a nation state and one has to have a passport for getting out of one's country and a visa for getting into another, it is imperative for intellectuals of a country

OUTSTANDING BOOKS

PERSPECTIVES IN GANDHIAN THOUGHT

Dashrath Singh

Presents the conceptual and philosophical analysis of the concepts of soul force, 'Swadeshi', 'Sarvodaya', 'religious politics' value education, environment challenges and conflict resolution in Gandhian perspectives.

1995

to realise the strategies, policies and designs which other states may have towards one's own. In the contemporary context, however, one may be deluded about the real 'other' as it is in the interest of those who aspire for an imperium over the whole world to see that neighbouring countries are at loggerheads with each other and that it is perceived as the super-arbiter in disputes between them. The real dynamics of world politics in contemporary times does not directly emanate from what your neighbouring state does or says but rather from those who wish to use both for purposes of their own advancement and domination over them. After the breakup of the Russian Empire, the US alone remains as the sole aspirant for global imperium in the coming century. Most of the world seems to have reluctantly reconciled itself with the situation, though there seems some attempt by western Europe on the one hand and Japan and China on the other to create some counter-balancing bargaining positions at least in some areas for themselves. As for India, it neither seems to possess the will or the vision or the skill to manoeuvre in the situation that is emerging both at the political and the economic level today.

Yet, ultimately it is the task of the intellectuals to expose the interests behind the rhetoric of values and, in a sense, confront those who want to impose a new order on the world with their own violation of it in their own country and their own peoples. In this task the intellectuals of the non-western world have an advantage as neither the US nor the European countries are a closed society and, at least the US is almost a pluralist society in the extreme where every possible view has still a preacher and an audience. These are some of the most investigated societies by their own institutions, but seldom has the data collected by them been used for purposes of a different analysis than the one which the intellectuals of that society are usually prone to do. The presence of religion and superstition in the west, for example, is rampant even on those prestigious campuses where every year thousands of non-western students go to learn and yet the image of rational west continues to dominate the non-western mind. Similarly, there is large-scale corruption in the military establishments and even the NASA Research Programme is not immune to it as has been documented by its own inquiry committees. Yet the picture of the honest west continues to dazzle and dominate the non-western mind. The discrimination against the different ethnic groups is well known as well as the fact that the *Sudra* functions in most of these countries are generally performed by legal or illegal immigrants from poor neighbours in Central and Latin America or even by those that are still pouring from the Pacific or the Far East. Yet the idea of a non-caste society in the west is sedulously propagated and accepted everywhere.

These are only rough examples. The point is that this immense data needs to be analysed from a new point of view and that empirical studies of western institutions in their own setting be undertaken by non-western students with open minds and open eyes. Also, the intellectuals of the western world should be challenged to take a closer look at the reality in their own countries and engaged in a dialogue regarding the double standards they use for description and analysis for their own country and the ones they use for countries other than their own. To give but one example, those who tell us that the idea of nation state has become outdated in the modern context need only be asked to abolish visas to their own country and face the consequences thereof. This of

course they will never do, for they would like the abolition of visas in all non-western countries for themselves and not be prepared to do the same for others in their own country. This epitomises the current world situation as do the exchange rates between the western and non-western world and it is in this context of inequality that the debate on a new world order based on universal values has to be conducted, for there still are sufficient persons in the west who believe in the universality of reason and a dialogue in its terms. But for that to occur, what we really need is an 'active intellect' that does not accept every intellectual ware that comes at its face value without scrutinising its real worth and testing it at the bar of one's own judgment and experience.

STRUCTURE AND ADMINISTRATION OF SALES TAXATION IN INDIA

- An Economic Analysis -
(1995-Second Edition)

by

Mahesh C. Purohit

Professor

National Institute of Public Finance and Policy

New Delhi -110 067

Price Rs. 450.00 ★ US \$ 60.00 ★

Hard Cover ★ Pages XII + 303 ★ ISBN No. 81-85930-01-5

Contents: Introduction; Fiscal role; Economic effects; Structure of sales taxes: Rate structure, exemptions, taxation of inputs, surcharge and additional sales tax, works contract and leases. Empirical estimates of incidence of sales taxes. Rationalising sales tax structure: Weaknesses of the existing structure, short and medium term reforms, an approach towards State-VAT. Inter-State coordination in sales taxes; Administrative organisation: Operation of the tax including evasion and enforcement; Management Information System; Summary and Policy imperatives

Another valuable treatise from the same author on:

**Principles and Practices of Value Added Tax
Lessons for Developing Countries
(1993)**

From Club to Karkhana

Sanjay Subrahmanyam

Maritime India in the Seventeenth Century by Sinnappah Arasaratnam; Oxford University Press, Delhi, 1994; pp ix + 294, Rs 375.

IN a publishing career that now spans very nearly four decades, Sinnappah Arasaratnam has been a prolific writer (at least 10 books, and several hundred papers would be my guess) on the history of Indian Ocean trade between 1500 and 1800, and on ethnic and sectarian problems over the last two centuries in Sri Lanka and south-east Asia. Where maritime India is concerned, his geographical focus since the early 1960s has very largely been on the Coromandel coast of Andhra and Tamil Nadu. He has drifted gradually from work on the latter half of the 17th century, to writing more and more on the 18th century. His current research seems to focus largely on issues relating to the transition to colonialism in the context of late 18th century Coromandel.

As he reminds us in his preface to this book, Arasaratnam was a founder-member of the Indian Ocean 'club' of the 1970s, which produced a number of influential essays and monographs, as also the collective volume *India and the Indian Ocean, 1500-1800* (eds Ashin Das Gupta and M N Pearson) in 1987. That work represented the belated result of a conference at Santiniketan, and the coming to fruition of a sort of consensus in which such historians as Pearson, Das Gupta, Om Prakash, Bruce Watson, Peter Marshall and of course Arasaratnam participated. These authors agreed in essence in the 1970s with the thesis of Steensgaard that the Companies were a significant modernising force in the context of the early modern Indian Ocean, and drew a sharp contrast between the 16th and the 17th centuries. They also set out a picture (adumbrated by Pearson and lent cautious support by Das Gupta) of Indian merchants adrift in a hostile sea, and prey to the competition of Europeans. Merchants and states were seen as clearly disjunct in the Indian context; this was seemingly a structural characteristic of Indian society. By the turn of the 1980s, this view had received the benediction of the doyen of India's 'medievalists', Irfan Habib, who took to quoting Das Gupta and Arasaratnam with undisguised approbation, even while expressing scepticism about some of Steensgaard's more extreme flights of fancy (on 'peddlers', for example). The view summarised above thus was by the early 1980s a perfectly well-established orthodoxy. Even determined loners like K N Chaudhuri (who perhaps preferred the Athenaeum to

the Indian Ocean Club) did not deviate significantly from this line (cf his 1985 work, *Trade and Civilisation in the Indian Ocean*), though admitting, like Habib, certain qualifications in respect to Steensgaard's arguments. Pucca members of the Army and Navy Club like G V Scammell (cf *The First Imperial Age*) quoted chapter and verse from the writings of this other club, while stoutly defending them from attack by their rare critics. *Noblesse oblige*.

But, by one of those minor ironies of history, by the time *India and the Indian Ocean* appeared, the club had become rather more crowded. Not only were there new applications for membership (from the likes of Teotonio de Souza, Anthony Disney, H W van Santen, or J J Brenning), but a number of 'gate crashers' came along to spoil the party. These were historians of the hinterland, like Frank Perlin, C A Bayly and David Ludden, who wished to incorporate the Indian Ocean into their arguments about the long-term historical trajectory of south Asia. Not content with challenging the historians of the interior, it appeared that they wished to break up the cosy division that the 1970s version of the Treaty of Tordesillas had imposed between coast and hinterland, and between those who read Persian and those who read Dutch (in a manner of speaking). Their intervention helped in part to shift the terms of the debate, to change the Indian Ocean from a closed club to an open-ended workshop, or a 'karkhana, if one prefers.

In a convoluted way, this book is Arasaratnam's response to these changes in the terms of the debate, and as such is a curious exercise. First of all, the book is deliberately designed to be totally devoid of footnotes and even bracket (Chicago-style) references. It thus has the appearance of a primer or manual. The references to other authors whose work has been consulted is relegated to a summary discussion in the 'Bibliographical Notes' (pp 276-91). Here, happily, not only the old faithful members of the club but relative latecomers (and even Frank Perlin) find mention. This is indicative of somewhat changed times, no doubt. But the technique has its limitations. The innocent reader is left with little or no sense that this book is located in a debate. Other writers are never cited or discussed in the text. We usually have to take Arasaratnam's espousal of an argument on faith, simply because he

believes that the contrary view is wrong, or 'exaggerated', or 'unlikely' (or because he does not mention it). The Author thus emerges as his own main Primary Source, in a happy conflation of categories. As a consequence, we have the construction of a mellifluous narrative, a 'story' if you will, that the reader is led into while sitting at Arasaratnam's knee.

This story is divided into 10 chapters. We begin with 'Ports and the Ocean', with its obligatory gazetteer-style move up and down the coast. This is a technique that Arasaratnam has long patented. Then we move on to the 'Legacy of the Immediate Past', which contains a synoptic and rather hurried discussion of the 16th century. There now follow four core regional chapters on Gujarat, Malabar and Kanara, Coromandel, and Bengal. Kanara is given rather short shrift in this process, as is the Konkani. Indeed, even Kerala winds up being rather neglected in relation to Gujarat and Coromandel.

The real 'innovation' comes in Chapters 7 and 8, which discuss merchants and their political positioning, and concede at least some modifications to the Pearson merchants-and-rulers hypothesis. The last chapter but one on 'Shipping and Seafaring' opens up an interesting domain but barely touches its surface. This is because the secondary literature there is poor, and in a book such as this, no new research by the author is demanded. The Conclusion provides one with a chronological prospect of the drift to European hegemony in the 18th century, and curiously enough reintroduces Pearson's hypothesis of weakly articulated states and unprotected merchants back into the picture.

In the final analysis, I must confess to being unsure who the reader of this book is meant to be. Specialists will want more depth, and in a more rigorous framework; they will also wonder why relatively easily accessible secondary literature in English is being summarised once more. Are the book's readers the hibernating historians of the interior, on the assumption that the old division of labour holds? Or is it meant to be a book to be browsed through and read on railway trains by curious members of the middle class? If the last, its narrative lacks the warmth, texture and relief that would hold such a reader's attention. Arasaratnam is a worthy essayist of the old school, but his writing style does not have the charm and grace of his colleague and ally Ashin Das Gupta. For example, the text is crowded with place-names and details that add little to its general outlines. There are no illuminating anecdotes, no juicy contemporary quotations, no witty turns of phrase. And, alas, some of the details are simply

wrong. We are told early on of "the first voyage of Vasco da Gama who was piloted by Abdul bin Majid, presumably a Gujarati Muslim" (p 8); later that Honavar was the principal port of the Nayaka of Ikkeri (p 22); or again of the Portuguese capture of Diu in 1554 (p 45); repeatedly that Nagapattinam was fortified by the early 17th century; on p 249, the incident attributed to 1638 took place in 1634; the Mughal ship *Ganj-i-Sawai* is throughout called *Ganj-i-Sawar*, and so on. Indian and Arabo-Persian names are spelt throughout with careless abandon: "Muhamad", "Taqui", "Meah Mizany", etc.

If there were a strong new argument in the book, or a strong quantitative foundation (as we expect from Om Prakash's forthcoming volume in the *New Cambridge History of India*) such detail could be dismissed as 'mere detail'. But the book is a work of narrative history, and hence has to be reliable as narrative. Here it falls short of expectations. This said, it must be said that the book does have its merits, most notably its useful bibliographical essay. Certain simple ideas are also set out, although at somewhat tedious length, and (for a book of this size) with a surprising amount of repetition. Still, we have a sense that – if only

the format had allowed him to – Arasaratnam might just have engaged his peers and even younger historians in discussion. This is reassuring because members of the Indian Ocean club have not always been so open-minded: another recent book by Arasaratnam and Aniruddha Ray, titled *Masulipatnam and Cambay* (Munshiram Manoharlal, 1994), possesses the apparatus of footnotes, but practically refuses to acknowledge the existence of other historians who have written earlier on these subjects.

Now, as teachers so often tell their budding research students, writing history is not merely about the relationship between the historian and his 'sources', but between the historian and historiography. Simple, unreferenced, under-problematised, narrative histories thus represent a throwback to another age, to the time of N Macleod and H Terpstra. We surely do not need to read Arnaldo Momigliano to realise that. As things stand, then, we must look forward to Arasaratnam's forthcoming monograph on late 18th century Coromandel, from which we shall have a better sense of where he chooses to locate himself in relation to other historians and their work – and, above all, why he does so.

studying the mahar movement, it is imperative to understand Ambedkar's idea of class-caste relationship and his treatment of caste as part of base or superstructure. Further, is this overlap between caste and class without any complexity? If this was so, as the author seems to believe, what sense does one make of the mahars of Vidharbha who were socially inferior to the upper castes but economically superior to them? Even today in the Nagpur region, landholdings of the mahars are larger than that of the upper castes. In fact, in some villages near Nagpur the upper castes work as agricultural labourers on the fields of the mahars. There are also medium mahar industrialists in Nagpur. Thus, this economic position of the mahars, at least in the Nagpur region, disturbs the correlation between low social status and low economic position.

Similarly, according to the caste-class overlap, the brahmins and the higher castes can easily be identified as the exploiters and the shudras as the exploited. But what about the kunbis, kapus and vokkaligas? Were they the exploited? Do they not exploit and assault the dalits even to this day? Was not Ambedkar sensitive to this non-brahmin-dalit tension in Maharashtra, and Madras presidency? Even today, along with the mental harassment, the growing atrocities on the mahar-buddhas by the upper castes, particularly the non-brahmin castes of rural Maharashtra, confirms the intolerance and hatred against these most exploited sections of Maharashtra. This attitude reflects a vertical articulation of social tensions.

Horizontally, internal differentiation is taking place among the mahars of Maharashtra due to the welfare-state intervention. This internal differentiation was visible among the mahars of Nagpur region even before independence. Gokhale rightly takes note of the role the state played in facilitating the elite formation among the mahars. Thus, we have mahar malguzars in the pre-independence period, and in the post-independence period we have mahar elites. Thus, the vertical social tension between the mahars and the middle and high castes and the horizontal tension within the mahars certainly calls into question the caste-class overlap the author is attempting to establish.

But then, if these internal, non-antagonistic contradictions are emerging within the mahar community, why do they not find organised and manifest articulation against the mahar aristocracy? It appears that the aristocracy has been trying to counter the subaltern mahar consciousness by either appealing to mahar solidarity in the face of any outside opposition to their vested interest or by performing welfare activities like inaugurating schools for mahars (like the ones started by mahar malguzars of Nagpur before independence) or distributing free books and clothes, and conducting free coaching

One-Dimensional View of Dalit Movement

Gopal Guru

From Concession to Confrontation: The Politics of Indian Untouchable Community by Jayashree Gokhale; Popular Prakashan, Bombay, 1993; pp 381, Rs 300.

BARRING a few exceptions both in Marathi and English, recent studies on the dalit movement in Maharashtra are either sequential in nature or theoretically insensitive. Jayashree Gokhale's book under review offers a theoretically sensitive approach involving criticism of the cultural-ideological approach adopted by M N Srinivas, Mark Juergensmeyer, Eleanor Zelliot, Owen Lynch and Michael Moffatt.

According to Gokhale, the cultural-ideological approach treats the untouchables as a striking case of submissiveness (p 34). On the contrary, the author argues, the untouchables did not always accept their lot with stoic obedience and docility. They, particularly the mahars, protested some times violently against repressive Hindu social order (p 34). The author criticises the cultural-ideological view of the dalit movement for not taking into consideration the overlap of caste and class dimensions of the mahar movement in Maharashtra. Therefore, the author, basing her theoretical framework on the approach of Kathleen Gough and Emmanuel Terry, believes that the historical development of the mahar community reveals

a structural overlap of the caste and class factor (p 15). This overlap of caste and class gets reflected in the relationship between the low economic position and the low position the mahars occupied in the social hierarchy of Indian society then and now. However, due to the lack of empirical data, the author, fails to substantiate this contention. Similarly, her criticism of the cultural-ideological approach for having overlooked the class conflict dimension of the mahar movement (p 5) does not get justified since her own study fails to establish sufficiently and systematically as to how the mahar movement in Maharashtra represented class conflict. The author, therefore, ends up giving a casual treatment to a complex but important concept like the caste-class overlap. This may be because the author has not located her own framework in the background of the debate that began in late 1970s between Dipankar Gupta, Sharad Patil and Gail Omvedt. In this debate which aimed at deciding the true epistemic status of caste and class, Gupta considered caste as a part of superstructure while the latter considered it as a part of the base [Gupta 1978]. In fact, for anyone

for poor mahar children. The mahar aristocracy also tries to assuage the common mahars by participating in the dalit struggle from the periphery, like paying nominal contribution to a social function or a social struggle the latter organise. Thus, resurrecting the ideology of mahar solidarity may not have direct hegemonic intention, nor it may reproduce the ideology based on social hierarchy (though this charge may hold true in respect of the attitude of the mahars towards the mangs) but it can indirectly contribute to legitimisation of the structures of domination. The author has missed this point which has lot of bearing on the formation of the anti-state, and therefore, anti-systemic mahar consciousness.

However, Gokhale's study of the mahar movement in Maharashtra makes three relevant points which are similar to Zellot's study on the mahar movement. First, the author attempts to understand the emergence of the mahar movement against the background of various pre-Ambedkar social movements by situating this emergence within the socio-economic changes taking place as a result of British imperialistic policies in the 19th and 20th century Maharashtra. She argues that the organised protest of the mahars under Ambedkar's leadership should be understood in terms of the displacement process of the mahars and their subsequent migration caused by the 'pull factors', such as education, industrialisation, business, transport and communication system that created job opportunities for the mahars (p 47) and the 'push factors', such as landlessness, uneconomical landholdings, and subversion of traditional occupations (p 47).

Secondly, Gokhale talks of the primacy of politics of the mahar movement in terms of political strategies, and the forms of political participation and political organisations that were used by the mahars to register their protest. She also highlights Ambedkar's growing political concern behind developing an independent mahar political identity. Thus, the strategical shift from the socio-economic sphere to the political constitutes the primacy of the political. This is a valid point since it highlights the centrality of politics in the mahar movement. Yet the primacy of the political is seen by the author as a disjointed process. The author seems to convey that the socio-cultural activities of the mahars in the 1920s were devoid of any political element. But were not the mahar efforts at temple entry and for sanskritisation potentially political as they reflected a negative consciousness which is a pre-condition of a real political consciousness? Moreover, Ambedkar's primacy of politics is not to be seen merely in its instrumentalist sense but also in its theoretical-normative sense. Ambedkar considered all struggles, including

the material and the ideological, as political. It is due to this political vision, that Ambedkar considers *Bhagwat Gita* a political book. The *Bhagwat Gita* legitimised the subjugation of the shudras and the at-shudras to the brahminical domination of upper caste class [Keer 1954:130]. By the same logic, Ambedkar's *The Buddha and His Dhamma* should be read as a political book since it annuls the negative utopia of *Bhagwat Gita* and provides a positive utopia of the Buddha and his Dhamma by assuring the toiling masses of the right to quality, liberty, fraternity and freedom. Thus, at a theoretical level Ambedkar's politics determines the creation of civil society and also aims at progressive transcendence of the individual into the collective. This has been adequately borne out by Ambedkar's criticism of the French revolution as a desirable but an incomplete revolution, and the Russian revolution as a complete one [Khairmode 1987: 47-48].

Thirdly, despite the theoretical failure to relate the caste-class overlap to the mahar situation, the author nonetheless attempts to critically assess the role of different political organisations floated by Ambedkar and later by his followers. Gokhale regards the Independent Labour Party (ILP) established by Ambedkar in 1936 as representative of the class model since it sought to include peasants and workers from all castes (p 134). She further argues that though the issues which ILP mobilised were secular in character (p 132), the party failed to sustain the class unity of all the exploited castes. She lists following reasons for the failure of ILP. Firstly, the Congress politics implanted a rift between the mahars and the mangs of Maharashtra. Secondly, the maratha textile workers practised caste discrimination against the untouchable workers in the weaving and spinning sections of Bombay textile mills. Thirdly, the communist commitment to social issues was questionable (p 140). All this prompted the mahars to have separate organisations which would represent their specific case.

Though it is true that the Bombay textile workers were plagued with caste consciousness and the communists failed to address it, this consciousness was not only a colonial construct but was also perpetuated among the workers by native industrialists of Bombay. For example, the chawls of Bombay textile workers were constructed by the British town planners and the native capitalists along caste lines which later became sites of caste and communal tensions [Guru 1987:39]. Further, why were the maratha workers practising caste discrimination against the mahars? Was it because the marathas were intrinsically casteist? Why were the marathas practising caste discrimination only in certain sections of the textile mills? This demands answer

because otherwise caste consciousness as a divisive force amongst the Bombay textile workers can become a stereotype. The marathas and other upper castes were opposing the entry of the mahars into certain sections of the mills because they did not want any further competition from the mahars for the already shrinking industrial jobs. Also, since the weaving and spinning sections were well-paid the marathas did not want competition in these sections [Chaudhari 1975:90].

DALIT RESPONSE TO CLASS-BASED MOBILISATION

In her chapters on Republican Party of India (RPI) and Dalit Panthers (DP), Gokhale assesses the political response of these two organisations to the class-based rural mobilisation of the landless castes of Maharashtra. She argues that the RPI and DP were in the beginning sensitive to the caste-class dimensions of the toiling masses of Maharashtra. To substantiate her argument, she refers to the dalit struggle for government land led by Dadasaheb Gaikwad and highlights the literary response to the dalit political movements in Maharashtra (p 226). Gokhale opines that the caste-class sensitivity of the RPI and DP, however, was temporary and both these organisations failed to sustain the democratic consciousness of the toiling castes (p 242). The reasons listed for the failure are: (a) the election manoeuvring by the dalit leaders, (b) the buddhist conversion that divides the mahars from the other scheduled castes, (c) the parochial mahar leadership, (d) the shift from the rural base to that of the urban middle-class of the RPI (p 250), and (e) the appropriation of dalits by the socialists and the Congress, leading to the eventual decline of dalit organisations (p 275). But this seems to be a simple, straightforward reasoning, inadequate to explain the complex dalit politics. It is not possible to grasp the failure of post-Ambedkar dalit politics (barring 1959, 1969 RPI, and early years of DP activism), without linking it to the ideologisation of Ambedkar by the RPI leaders and their so-called dalit intellectuals in the state. This ideologisation emphasises Ambedkar's ideas on democracy, liberal state, political and bureaucratic power, and the Indian Constitution. It underplays his critique of liberal democracy, which grants only a legal status to the individual [Guru 1993a]. It overlooks his critique of political power in plural democracy which cannot sufficiently arm the dalits to change their life condition [Guru 1993b] and his criticism of the Indian Constitution as a text full of contradictions. This ideologisation causes damage not only to Ambedkar but to the entire toiling masses in three ways. Firstly, it robs Ambedkar's ideology of its

CURRENT PUBLICATIONS OF NCAER

1. **Consumer Market Demographics in India**

(Revised Edition) Edited by **Prof. S.L. Rao**

Price: Rs. 1,900/- (Postage Rs. 20/- extra)

This publication gives valuable data on the purchase and consumption of selected consumer goods. It is based on four countrywide surveys conducted by NCAER between 1985-86 and 1989-90 on a sample of 5,00,000 households (for consumer durables) and 18,000 (for consumables). The **revised edition** makes the data sets more user-friendly. There are detailed write-ups on the demographic data and consumer profiles for a number of consumer products.

2. **Working Paper No. 50: Industry and Economic Reforms, 1991-1994**

by **Prof. S.L. Rao**

Price: Rs. 60/- (Postage Rs. 10/- extra)

This paper attempts to review the impact of the changes in economic policies between 1991 and 1994 as they have affected Indian industry. What seems to emerge is that there has been no coordinated set of policies towards industrial reforms. If Indian industry is to be competitive there are actions which require to be taken at the Government policy level, and also the micro company level.

3. **Restructuring of State Level Public Enterprises in Rajasthan**

by **Prof. S. L. Rao and R. Venkateshan**

Price: Rs. 150.00 (Postage Rs. 10/- extra)

Despite the massive resources invested in SLPEs they have not received the attention they deserve especially in initiatives regarding their restructuring and revitalisation. This is perhaps the first attempt to look at the total public enterprise system in a State using a strategic management framework as well as the economic viewpoint

4. **Protective Net for Workers in An Exit Policy**

by **Prof. I. Z. Bhatti**

Price: Rs. 20.00 (Postage Rs. 10/- extra)

This paper provides a discussion of some of the major issues relating to an exit for industry in the context of economic reforms which are now underway in the country.

5. **Working Paper No. 51: From Closed to Open Economy Macroeconomics: The Real Exchange Rate and Capital Inflows, India, 1981-1994**

by **Deepak Lal and D. K. Joshi**

Price: Rs. 100.00 (Postage Rs. 10/- extra)

This paper uses the framework of "Australian" balance of payments model for a small economy to explain the evolution of major economic variables in India since 1991. It also attempts to identify the key policy instruments which are relevant in determining macroeconomic balance in the case of India which is likely to witness a large increase in capital inflows.

revolutionary and subversive character and hence in effect leads to the legitimisation of the oppressive ideological and institutional structures. As a corollary to this, the ideologisation replaces the need on the part of the dalit leaders to make Ambedkar's ideology complementary to other emancipatory ideologies. The critique of Gandhi and Marx, right from B C Kamble in 1959 to Mayawati in 1994 is the case in point. Dalit intellectuals who attempted to relate Ambedkar to Gandhi or Marx are projected as anti-Ambedkar and, therefore, traitors. The ruling party and the state in Maharashtra feels comfortable with leaders who condemn left dalit intellectuals and labelled the land struggles of the dalits in 1959 and 1964 as unconstitutional [Kasloe 1989]. In such situation, the state finds itself free to discredit the dalit movement by co-opting the most radical dalit leaders like Dadasaheb Gaikwad under whose leadership the land struggle of 1959 and 1964 had seriously threatened the post-independence state for the first time. This ideologisation of Ambedkar has hampered the growth of democratic consciousness through a broader ideological mobilisation of the toiling castes. The dalit leaders have appropriated Ambedkar unto themselves, raising his statues and busts in the narrow contours of a mahar or buddhist colony. The state and the rural and urban rich help such efforts deifying Ambedkar by offering government land and finance. This kind of patron-client relationship between the state and the dalit power brokers is a result of a class alliance. The dalit clients who either profit or live-off the exploitation of their labouring brothers, are maintained by their patrons at the periphery of various power structures and thus, specialise in legitimising the state. Hence, it is absolutely essential to take into consideration the state-dalit relationship. Co-optation of dalits by the Congress does not completely explain the systematic suppression of organised dalit expression by dominant political forces.

MAHAR-MANG CONFLICT

In locating caste and class dimensions of mobilisation of the toiling masses Gokhale views Ambedkar's buddhism as relevant for the class mobilisation of lower caste Hindus and the untouchables. She argues that Ambedkar's buddhism provided basis for the consolidation of a new caste identity. But, buddhism which was a rallying point in affecting horizontal mobilisation could neither achieve the unity of all castes within the dalit community nor could it achieve vertical mobilisation of lower caste non-dalits and the dalits. According to Gokhale, buddhism could not have total impact even on the mahars (p 157). However, the author does not give appropriate reasons for the failure of buddhism to create democratic

consciousness both at the vertical and horizontal levels. To understand this, it is necessary to ascertain whether the failure is a fault of the buddhist theory or the buddhist practice? In fact the fault lies in the theory as well as the practice. The buddhist bhikshus with the sole exception of Anand Kousallayan, do not reinterpret buddhist 'tri-saran' as equality, fraternity, and freedom from exploitation. They do not separate the tri-saran from the 'panchasheel' which is related to individual moral conduct. These leaders insist that both these aspects of buddhism should be followed. Thus, the attempt to force down the throat of the followers who are not prepared to digest this combination is bound to fail. In other words, the attempt is to dissolve the tension between the tri-saran (the collective) and the panchasheel (the individual). Thus, the lack of radical reinterpretation of the tri-saran as equality, fraternity, and freedom from exploitation, and the failure to isolate the tri-saran from the panchasheel (making the latter an individual prerogative) prevents people who find it difficult to follow the panchasheel in toto from coming together on the tri-saran which offers a common programme for collective mobilisation of the oppressed. This buddhist homogenisation, which neither the Buddha nor Ambedkar would have approved, is also evident at another level. The buddhists insist that they should adhere to buddhism in its positivistic form of complete rationality and scienticism. Those who do not fulfil this essential condition face dire consequences like social boycott, unbecoming of any buddhist practice. If this homogenisation prevents the mahar-buddhists from enjoying other creative cultural practices of the little tradition how can they fulfil Ambedkar's dream of the buddhist dhamma? Since this homogenisation eschews varkari bhakti tradition of Chokha and Tukaram (some attempts in this direction are being made by dalit leaders, like Arun Kamble, and Bahujan Mahasangha in Maharashtra), how can buddhism be expected to unite the other backward castes to create conditions of emancipation? Such queries should have warranted author's attention.

Moreover, assessing the impact of buddhism in Maharashtra, it is observed that the response of dalits to buddhism is uneven in Maharashtra. The mahars from Vidarbha were the first to respond while the dalits from Konkan and southern Maharashtra were the last. Did the various social reform movements, and bhakti movements like mahanubhav, varkari made it easy for the Vidarbha mahars to respond to Ambedkar's call earlier than their counterparts from Konkan and southern Maharashtra? Or was this due to absence of strong Christian movement that would otherwise have deviated the mahars of Vidarbha from the

buddhist conversion? In fact this was the case. So, how come Gokhale says that the buddhist conversion was a personal decision of Ambedkar, and the mahars responded to it overnight (p 171)? Incidentally, there is a late response, as late as 1982, of the mahars to buddhism in western Maharashtra. What could be the reasons behind this occurrence? Questions such as these remain unanswered.

According to Gokhale, the mahar-mang conflict has been another major hurdle in creating class model of politics in Maharashtra. The author, taking cue from various studies, lists following factors for the conflict between the mahars and the mangs: the monopolisation of various government schemes by the mahars, the feeling of mutual suspicion, the controversy over the buddhist conversion and the passing-over of traditional occupations of the mahars to the mangs. It is true that the mahars have taken more advantage of government opportunities. But otherwise the mahar-mang tension is treated by the author at the level of polemics. If the debate is not comprehensive it can lead to serious problems. This is already happening as some mang elites and Congress leaders are fanning hostilities between the mahars and the mangs [Guru 1993c].

The question that begs serious attention is why the mangs have become mobile recently? Their traditional skills like rope-making, baskets and broom-making kept the mangs tied to the village economy. As compared to the mangs, the mahars were unskilled labourers and numerically larger, and hence, had to face early displacement from the village due to the growing pressure of agrarian unemployment caused by the depeasantisation of the cultivating non-dalit castes under the British colonialism. The mahars took to education for survival, and hence, their early response to government facilities. Though the mangs from the drought-prone area of Bombay state were migrating to cities even before 1947, a massive displacement of the mangs began from 1970 onwards. It is during this period that the ropes produced by Garware Nylon industries subverted the traditional occupation of the mangs in a big way. Thus, by the time the mangs arrived in the developmental process, they found it already stagnated in terms of job opportunity and other avenues of progress. Instead of understanding these processes that underlie the structure of inequality, the mangs hold the mahars responsible for their backwardness. This anti-mahar feelings are inflamed by the interested parties, sometimes leading to clashes between the two communities. Gokhale cites British rope industries subverting the traditional occupation of the mangs in the beginning of 20th century. But this is dubious. Firstly, Gokhale does not provide any evidence as

to when, how and where the British rope industries subverted the mangs traditional rope-making occupation. Secondly, the displacement of the mangs can best be understood in terms of the drought situation that pushed the mangs out of the village economy.

MAHAR MOVEMENT IN VIDARBHA

Discussing the early organisational efforts of the mahars of Bombay and Nagpur regions, Gokhale draws an interesting theoretical point about the different political development of the mahars of the Nagpur region from the other parts of Maharashtra, relating this difference to socio-economic factors. She mentions that the mahar movement in Vidarbha being less radical than that in Konkan and the Desh (western Maharashtra) (p 74). However, Gail Omvedt differs from Gokhale's observation. Omvedt locates an element of radicalness among the mahars of Vidarbha. Omvedt attributes this radicalness to the liberal political atmosphere that prevailed in Vidarbha and to the peasant-worker nexus. Omvedt's argument makes sense if one understands it against the background of the massive suppression of the mahar political expression in Marathwada for 500 years under the hostile feudal structure of the Nizam of Hyderabad. But Gokhale's observation also seems valid since the mahars of Vidarbha, at least a wealthy section of it, lacked radical content. Yet, Gokhale fails to relate as to how the relative affluence of Vidarbha mahars led to the blunting of radical edge of the mahar movement. This relative lag in the mahar consciousness can be understood if the mahar material interests are seen to be no different from the upper caste zamindary interests epitomised either in the Hindu Mahasabha or the Congress of Vidarbha. It is against this background that one can understand the mahar leaders favouring the Congress and the Hindu Mahasabha in Vidarbha. Delineating the logic of this regional variation further Gokhale argues that the economic comforts of the mahars' as well as their fragmentation into sub-castes prevented the development of a radical consciousness in the mahar movement of Vidarbha. Gokhale also thinks that the isolation of Nagpur from events and advances taking place in Bombay and the absence of the mahar military tradition which played a major role in mobilising the mahars of Konkan and Satara to have contributed to this phenomenon (p 74). Even though the military tradition has contributed to the radicalisation of the mahar movement, the first argument by Gokhale is less convincing. Firstly, there was no physical isolation between Nagpur and Bombay. They were linked to each other by railway. Ambedkar accompanied Chhatrapati Shahu of Kolhapur to Nagpur in 1920. Therefore,

the lack of radicalness, if any, needs to be explained in terms of something else, and not isolation. In fact, after 1920 Ambedkar stirred the mahars against the British imperialists and the native brahmins and banias. Even if one accepts Gokhale's argument that the mahar movement in Konkan and the Desh was socio-politically radical than the mahar movement of Vidarbha, it holds true for the pre-independence period. After independence there is an eclipse of militancy and radical content in the mahar movement of these regions [Guru 1993d]. (Gokhale has not covered the pre-independence mahar movement of Marathwada.) Gokhale's work does not forward any answer regarding the regional variation in the expression of dalit protest from 1960 onwards. Yet, the following argument can elucidate the de-radicalisation of the movement in western Maharashtra. The green revolution and the network of co-operative institutions has resulted in the improvement of economic conditions of both the mahar landholders and the landless labourers in western Maharashtra. As a result, the dalits identify themselves with the co-operative bosses at various levels of politics. It is due to these corresponding benefits, no dalit group can claim to be enjoying the support of the common mahars from southern Maharashtra. Besides, the co-operative structures, the Christian conversion of the dalits in this area also contributed to the pacification of the dalits. The Christian conversion did not advocate confrontations with Hinduism which the buddhist conversion in Vidarbha and Marathwada effectively did. It is only after Chundure killings that the Dalit-Christian Liberation Movement launched a scathing attack on Hinduism of RSS variety [Guru 1992]. In the Konkan, the mahar movement has almost disappeared after independence because of the massive migration caused by regional backwardness. The landlessness of the mahars who did not possess even the watan-land facilitated the migration [Gaikwad 1992]. As a result, the young mahars migrating to Bombay and Pune left the older ones to survive on the money order economy. In such a scenario the mahars cannot become a critical part of the social relationships in Konkan. Thus, there cannot be any radical movement based on genuine and authentic consciousness of the local mahars.

As compared to the Konkan and western Maharashtra the dalit protest in Vidarbha is more militant and the dalit solidarity much stronger. This dalit militancy is often reflected in their collective retaliation of the Shiv Sena and their militant protest on the renaming issue of Marathwada university. Five dalit activists from Nagpur were killed in the police firing of 1978. The dalit solidarity is also reflected in the dalit folk

literature of Vidarbha. This militant expression of dalit protest in Vidarbha is due to genuine educational interventions by the non-brahman leaders. The educational endeavours of Punjabrao Deshmukh, the Nagsenvar education campus at Aurangabad whose first beneficiaries were the students from Vidarbha, the lack of Christian missionary activities, the presence of strong traditions of bhakti movement which later contributed to the buddhist conversion of the mahars of Vidarbha and the relatively large dalit population boosting the confidence of the dalit masses led to the militant expression of the dalits of Vidarbha. Though Gokhale has not studied the dalits of Marathwada in depth, the recent rise of the dalit militancy in Marathwada would certainly make very interesting study. Moreover, it would be interesting to gauge to what extent the dalit literary movement reflected the aspirations of the dalit movement. It is not always possible for a scholar abroad to keep track of the nature and scope of any movement that is being shaped by dialectical unfolding of events. Therefore, keeping in view the constant attempt by the Hindutva forces to Hinduise Ambedkar, the author ought to had been careful in borrowing unconditionally from Dhananjay Keer who sees Islamic conversion of dalits as de-nationalisation of the latter (p 169). Nonetheless, Gokhale's book is certainly an useful addition to the literature on the dalit movement in Maharashtra.

Should Indian Railways Be Privatised?

M Q Dalvi

The operating losses experienced by many railways in the face of competition from other transport modes have compelled many national governments to restructure their railway organisations in order to administer them on commercial basis. One such structural reform suggested is the privatisation of railways.

This paper examines the case for privatising Indian Railways, one of the largest rail networks in the world. The case is examined using the framework of the modern theory of contestability (which has underpinned the recent trends towards deregulation in the US), and the theory of property rights (which has provided the principal rationale for privatisation in the UK). The paper concludes that, viewed in welfare terms, considering the social burdens Indian Railways have been required to carry, the gains in productive efficiency accruing to the Railways from privatisation would be more than outweighed by losses of allocative efficiency and other non-commercial output which the country has enjoyed from the historical role the Railways have played in its socio-economic development.

I

Introduction

IN developed countries the difficulties experienced by many railways to increase their passenger or freight traffic or to prevent it from falling while the overall movements having increased have compelled national governments to restructure their railway administrations in order to run them on commercial lines [Silverleaf 1992]. In some countries, the structural reform has assumed the transfer of the railways from government departments to public corporation. Elsewhere, the change has involved their transfer directly from government ownership to private ownership. Some of the major advantages claimed for privatisation of railways are, better use of the railways, greater responsiveness to the customer, a higher quality of service, greater emphasis on profitability and better value for money for the public who travel by rail. Except in the case of Japanese National Railways (JNR), which were privatised on April 1, 1987, there is, however, little hard evidence to support these claims. JNR was split into six regional passenger companies and one nationwide freight company.¹ All these companies, it has been claimed, have shown remarkable improvement in performance since they were created five years ago. This is in sharp contrast to the declining performance and financial troubles experienced by JNR five years ago. All the same, because of the particular aspects of the operating environment in which the privatised railways in Japan have been functioning, the Japanese experience is not readily transferable to other countries. The case for privatisation of railways must be carefully examined within the operating environment of each individual railway. The main objective of this paper is to critically examine the case for privatisation of Indian Railways. The issue has been

raised by the Railway Fare and Freight Committee in the questionnaire circulated by it for public evidence. Since privatisation is one of the favourite prescriptions policy-makers have recently been recommending almost everywhere for reorganising the structure of many ailing industries, there is need to debate whether and to what extent this remedy can be applied to cure the organisational ills of Indian Railways.

The format of this paper is as follows: we, first, discuss briefly the theoretical underpinnings underlying the case for deregulation and privatisation; next we examine the recent experiences of the US and the UK in the deregulation and privatisation of some of their important industries. Deregulation has played more crucial role in the recent industrial changes in the US, while privatisation has been one of the great success stories of the Conservative government in the UK. We then proceed to see to what extent the theoretical models developed for justification of deregulation and privatisation can be applied to railways in general and to Indian Railways in particular. Finally, since Indian Railways are operated as a departmental undertaking of the ministry of railways, the paper proceeds to examine the case for converting the Railways into a public sector corporation as a measure of improving their productivity and financial performance. The final section summarises the main conclusions of the paper.

II

Theory of Deregulation and Privatisation

It is useful at the outset to draw a distinction between deregulation and privatisation as the two terms, although used interchangeably in the literature, do not necessarily connote the same thing. Deregulation involves abolition of all forms of institutional, legal or statutory

impediments to the entry or exit of firms in a given industry irrespective of who owns the firms, the aim being to promote competition in the product/service market; whereas privatisation implies transfer of ownership rights from public to private sector. Such transfer may take the form of handing over the ownership to a single individual or firm or a group of firms in the private sector (which may occur in the absence of a capital market) or a wider group of shareholders via the capital market. Privatisation is an antithesis to nationalisation but deregulation can co-exist with both public and private ownership of the means of production and distribution.

The theoretical underpinning for deregulation and privatisation is derived from the work of the American economists on 'contestable markets', particularly in the work of Baumol, Panzar and Willig (1982) and Baumol and Willig (1981). A contestable market is one in which existing firms are vulnerable to hit-and-run entry. All firms – actual and potential – have access to the same production methods, and hence their cost functions are identical. The essential characteristic of a contestable industry is that entry involves no sunk costs; a firm can enter the industry without making irrevocable expenditures, and so there are no barriers to exit. As Baumol (1982) has put it: "Even a very transient profit opportunity need not be neglected by a potential entrant, for he can go in, and, before price changes, collect his gains and then depart without cost, should the climate grow hostile."

Here the distinction between sunk costs and 'fixed costs' should be noted. Fixed costs are costs that do not vary with the level of output; they are not always sunk. Fixed costs might be avoidable, for example, by renting assets from another market on short contracts, although, as Beesley (1986) has mentioned, they might well be embodied in items of equipment

to the extent that the market supplying (renting) the equipment itself reflected 'sunk costs' of commitment to that market. It is perfectly possible to have a contestable market with high fixed costs, so long as there are no sunk costs, and indeed a natural monopoly market can in principle be contestable and vulnerable to hit-and-run entry.

If equilibrium exists in a contestable market, the following properties hold [see Vickers and Yarrow 1989]:

(i) Price P equals average cost. That is to say, all firms make zero profits. If $P > AC$ there would be an incentive for a new firm to enter the market and to displace an incumbent firm by slightly shading its price. If $P < AC$ a firm would do better to leave the market, which can be done costlessly in view of the assumption that sunk costs are absent. It follows that $P=AC$ at equilibrium.

(ii) There is no inefficiency in production. If an existing firm was producing its output at more than minimum cost, rivals would find it profitable to enter the market, take the firm's business, and produce more efficiently.

(iii) Price is at least as great as marginal cost. If some firm was operating where $P < MC$, a new firm could profitably enter the market producing slightly less than the other firm and take that firm's business by shading price infinitesimally. This strategy could be profitable because the marginal revenue lost by reducing output, which is approximately equal to P , is less than the saving of MC .

(iv) If there are two or more firms at equilibrium in the market, then price is no greater than MC . If one of the existing firms was operating where $P > MC$, a new firm could come in and produce slightly more than that firm. The entrant's marginal revenue $MR (=P)$ would exceed his MC , and so he would make more profit than the firm displaced. The entrant could (and would) also take some of the business of the other incumbent firms by an arbitrarily small price reduction. (Note that (iii) and (iv) together imply that $P=MC$ if there are two or more firms at equilibrium.)

(v) The number and configuration of firms at equilibrium is such that industry output is produced at minimum cost. There is therefore productive efficiency at the industry level as well as the firm level.

Results (i) through (v) above were stated in the context of a single product industry in order to show as clearly as possible why they hold. The arguments generalise naturally to multi-product industries, where (i) through (v) also hold. However, for an equilibrium in multi-product industries, two more conditions must hold.

(vi) There would be no cross-subsidies between products/services. This follows from the condition that price must be at least as great as marginal cost for all products/services in the industry. Otherwise a new firm could

profitably enter producing slightly less of the product/service in question than some existing firm. This profit opportunity is ruled out only if cross-subsidy is absent.

(vii) If indivisibilities or joint costs exist, then under certain assumptions about cost conditions (trans-ray convexity and declining ray average costs), allocative efficiency can be achieved by adopting Ramsey pricing, under which prices are allowed to exceed marginal costs by a factor which is inversely proportional to the price elasticity of demand. Ramsey prices maximise welfare subject to a minimum profit constraint.

By now it will be clear that the properties that hold at equilibrium in a contestable market are highly desirable by the yardstick of traditional welfare economics. There is internal efficiency, because firms – individually and collectively – are compelled by the mere entry threat to produce at minimum cost, and there is allocative efficiency because $P=MC$, except possibly in a natural monopoly (in which case pricing is optimal subject to the non-negative profit constraint).

The theory has been proposed as a competitive benchmark that is in a sense more general than the traditional textbook model of competition. Instead of a large number of very small firms being the hallmark of competition, it is entry threats that make for competition in a contestable market, even though only one or two firms might exist at equilibrium. In fact, market structure is determined endogenously by the fundamental parameters of technology and demand. It is sunk costs (as opposed to fixed costs) that are central to the contestability theory.

The contestability theory has been at the heart of the recent American enactments on deregulation, notably of telecommunications, airlines and road haulage. The motivation for deregulation and, in particular, for privatisation in the UK was, by contrast, provided by the Austrian school of thought which emphasises the role of 'property' or 'ownership' rights and of 'incentives' for profit maximisation in the evolution of an optimal industry structure. Transfer from the public to the private sector (or vice versa) of entitlements to residual profits from operating an enterprise necessarily implies a change in the relationships between those responsible for the firm's decisions and the beneficiaries of profit flows. In general, the change in the allocation of property rights leads to a different structure of incentives for management and hence to changes in both managerial behaviour and company performance. The British privatisation philosophy has been rationalised within the framework of these incentive effects [Vickers and Yarrow 1989].

This paper does not wish to go into the details of the Austrian economics of privatisation-interested readers may refer to Vickers and Yarrow (1989) and Beesley

(1992). However, a brief description of principal-agent theory is in order. The general agency problem can be characterised as a situation in which a principal (or a group of principals) seeks to establish incentives for an agent (or a group of agents), who takes decisions that affect the principal, to act in ways that contribute maximally to the principal's objectives. The difficulties in establishing such an incentive structure arise from two factors: (a) the objectives of principals and agents typically diverge, and (b) the information available to principals and agents will generally be different.

Within this framework, managements of enterprises can be regarded as agents acting (in the case of private ownership) for shareholders or (in the case of public sector ownership) for the department of government to which they are responsible. Alternatively, in the latter case, government departments may themselves be considered to be agents acting for the ultimate principals, the voting public. Either way, an immediate consequence of privatisation will be some shift in the objectives of principals. In addition, it is also expected that the transfer of ownership will be associated with some change in the types of incentive systems that can be offered to managements. Thus, under private ownership, rewards can be linked to the company's share price via share ownership or option schemes, while poor financial performance might be penalised by the threat of takeover by another firm or bankruptcy.

In developed countries, privatisation of public enterprises typically entails the sale of equity to many shareholders, each of whom possesses a relatively small fraction of the total equity of a particular enterprise. Hence, at any time, a shareholder can transfer his property rights to another investor and thereby terminate his direct relationship with the company. As a result, substantial changes in the number of principals and in the distribution of shareholdings can occur quite rapidly [Alchian and Demsetz 1972]. In these circumstances, the pursuit of its own objectives by the management of the enterprise will be constrained by three groups of participants in capital markets: (i) the enterprise's shareholders, seeking contractual arrangements with management that maximise their own payoffs; (ii) other investors or their agents who might purchase the firm's shares as a prelude to attempting to alter existing contractual arrangements; and (iii) the enterprise's creditors who could seek managerial changes in the event of threatened or actual default.

The emphasis upon ownership rights and the associated principal-agent problem in the British attitude to privatisation must be considered against the background of the persistent problems of management and control which have made the relations

between government and nationalised industries one of the constant sources of friction between government and public administration. Underlying the privatisation process in the UK has been the belief that it will lead managers to place greater weight on profit maximisation and technological and managerial innovations as private sector managers are subject to incentives and disciplines different from, and more demanding than, those which apply to their public sector counterparts. In actual practice, however, the British privatisation programme has been motivated by such a multiplicity of objectives that it is difficult to find any clear rationale behind it [Kay and Thompson 1986]. While the concern to promote internal efficiency and encourage innovations through competitions has remained the most frequently pronounced objective of each privatisation scheme in the UK, the treasury's main interest has been in the revenue which could be raised from privatisation. Some policy-makers saw a god-given chance to reverse the clock of socialism through privatisation while others looked at it as a means of disciplining the power of public sector trade unions. Thatcher wanted to promote popular capitalism through wider share ownership.

III

Privatisation in Practice

Before proceeding to discuss the case of railway privatisation it would be interesting to mention in passing how deregulation and privatisation programmes have fared at least in the two western countries, viz, the US and the UK, where they have played a prominent part over the last 15 years in changing the industrial structure of those countries. We begin with the US experience first.

US EXPERIENCE

Since there was hardly any nationalised sector in the US, the main focus of attention has been to promote a competitive industrial structure through deregulation in those private industries which were dominated by monopolies. The US policy was based upon a coherent rationale derived from the contestability theory. If this theory has some validity, it was expected that deregulation would set in motion forces which will revolutionise managerial practices or structures and bring about technological changes, resulting in productivity improvements. These improvements will lead to fall in prices or improvement in product quality and finally elimination of cross-subsidy.

Has the American experience confirmed the expectations of the contestability theory? By way of illustration I refer to four industries which were deregulated in the US in the early stages of its recent deregulation history, viz: (i) stock market, (ii) airlines, (iii) trucks

and railroads, and (iv) telecommunications. My summary comments are as follows [for a detailed discussion of the US experience, see Bailey 1986].

(i) *Stock market*: Trading on the American stock market was deregulated on May 1, 1975 when brokers were allowed to compete on price and freely charge commission rates irrespective of the size of the securities transactions or the class of investors. Until then brokers were required to charge fixed commissions for these transactions. This had led to various malpractices, including pressures from institutional investors for volume discounts and services of various sorts. Since 1975 there have been substantial gains for the large institutional investors, whose rates have been reduced by more than 50 per cent. Smaller institutional investors have gained about 20 per cent from price declines. Commission rates for small trading blocks for individual investors rose slightly, but declined more than 50 per cent for individual trades in large blocks.

(ii) *Airlines*: A major step towards deregulation in US was taken when the Airlines Deregulation Act was passed in 1978, which fully deregulated routes by December 31, 1981 and rates by January 31, 1983. Until then, major markets were reserved for trunk carriers, such as United and American. Prices were set by a formula developed by the Civil Aeronautics Board (CAB) since 1938. Safety regulation was unchanged and was retained under Federal Aviation Administration (FAA) while residual regulatory functions were transferred to US Department of Transport as CAB was closed in 1985.

How has deregulation affected the American airline industry? In the years immediately following deregulation, there were substantial gains in productivity due to reduction in costs and economies in the scale and scope of operations. Overall there was 40 per cent reduction in fares but the gains in terms of fare reduction were not spread uniformly across all the markets. There were differences in fare reductions depending upon market distance and market size. In thin markets, where the CAB formula was known to undervalue costs, fares in fact went up about 10-15 per cent. Similarly, fares tended to go higher for short haul markets of moderate density, where CAB formula fares had again been set below cost. The long distance routes and high density markets gained maximum from fare reduction. Load factors also recorded a significant improvement in the wake of the structural changes which occurred following deregulation. Small local service carriers substantially expanded the scope and scale of their operations. Airline companies of all types (from trunk to local operators) increased the percentage of their departures from main city hubs. The hub-and-spoke

delivery method discouraged abandonment of thin routes because of the benefits of maintaining spoke routes for feeder traffic for trunk routes in order to take advantage of the economies of scale of plane size. In the subsequent years, the smaller carriers could not withstand competition from the trunk-route carriers for spoke traffic and so many of them went bankrupt. The American airline industry is once again dominated by big carriers exhibiting the usual features of the oligopolistic market.

(iii) *Trucks and Rail*: Although rail and road transport has been in private hands in US, regulation by the Interstate Commerce Commission (ICC) had led to balkanisation of authority (few, if any, integrated national route structures existed), legislation of collective rate making and the careful scrutiny of rates which threatened to upset the market structure. There was an urgent need to deregulate the transport market by relaxing collective rate-making and removing barriers to entry and exit. Bankruptcy of the Penn Central led Congress to pass the Railroad Revitalisation and Reform Act in 1976 and the Staggers Act (rail) and the Motor Carrier Act (trucks) in 1980. The two pieces of railway legislation segmented the industry into competitive and market-dominated spheres. The truck legislation made entry much easier, as the burden of proof was shifted to opponents of entry to show that entry was harmful to consumers. Deregulation has had beneficial impacts in both the sectors of the transport market. The costs of transport were reduced as a result of productivity gains and there was a significant increase in freight traffic. For example, real rates for truck-load have declined 25 per cent, rail rates have dropped 7 per cent and rail movement, particularly trailer on flat car services, had risen by more than half between 1981 and 1984.

(iv) *Telecommunications*: Until early 1960s, the industry was dominated by AT and T. Basically, technological changes in the provision of long-distance services had undermined the natural monopoly enjoyed by AT and T. As coaxial cable supplemented ordinary cable, and as microwave and satellites and optical fibre supplemented coaxial cable, costs fell dramatically. Meanwhile, a series of decisions by the Federal Communications Commission (FCC) and the Courts from 1959 to 1969 authorised competitors to build alternative networks which practically eroded the monopoly of AT and T. The opening process was made far more rapid as a result of anti-trust suit against AT and T by US Department of Justice in 1974. In the settlement in 1982, AT and T was divested of its local portions of its 22 Bell operating companies, which were restructured into seven holding companies. Thus, telecommunications became a fully deregulated market, providing

considerable choice to users for long-distance services. The gains of deregulation in this field have mainly been in the form of the reduction of cross-subsidy between local and long distance services. Cross-subsidy occurred due to two factors: Technological changes sharply lowered the cost of long-distance calls relative to local calls, while political rate-setting process saw to it that local rates were held down.

UK EXPERIENCE

As has been observed earlier, there has been no coherent rationale for privatisation of state enterprises in UK, the chief motivation being to sell state assets to mobilise revenue for the exchequer [Kay and Thompson 1986]. The Conservative Party's election manifesto of 1979 had relatively little to say on privatisation, and, during the first term of Thatcher's government in office, the proceeds from sale of state assets were below £ 500 million per annum. However, after Thatcher's re-election in June 1983, the privatisation programme was accelerated dramatically. By the 1987 election the annual proceeds from asset sales approached £ 5 billion, i.e. about 10 times the earlier level.

The privatisation of British Telecom in 1984 marked a major point of departure in the UK privatisation programme. This was followed by the privatisation of gas, electricity, airports and water industries. In the UK, privatisation entailed the replacement of public ownership by private ownership, with the state playing the role of a regulator to protect consumer interest. In comparison with the American deregulation policy, little attention was paid to promote competition, especially in the early stages of the privatisation process, the assumption being that competition would follow automatically as a consequence of the simple transfer of ownership. British Gas and British Telecom were example of this. In fact, in the words of Kay and Thompson (1986), "privatisation in the UK has increasingly come to emphasise the virtues of denationalisation over, and even at the expense of, the promotion of competition". It was realised much later in the day that if privatisation were to set in train competitive forces to revolutionise the UK's industrial structure and also bring about technological changes which were so essential to enhance the productive efficiency of its industry, it was vitally important to undertake, simultaneously with the transfer of ownership, explicit measures to promote competition.

Such a change in the British attitude to privatisation occurred with the enactment of the Transport Act 1984 which deregulated local bus transport services all over the UK except in London. Earlier in 1980 when the long distance coaching services were deregulated, it was expected that the National Bus Company (a public sector undertaking),

would be broken up and sold to the private sector. But this did not happen because of disagreement about the future structure of the industry. The 1984 Transport Act, in my view, provided for the first time in the UK a clear and coherent framework for the deregulation and privatisation of public sector activities, whose declared objectives were not only to sell public sector transport undertakings to private operators but also to promote competition in the local bus industry by removing barriers to entry for the new comers. This point needs to be highlighted in passing, for it not only accounts for the relative success of deregulation and privatisation policy in the road transport sector but also for the absence, in this sector, of complex regulatory machinery which has to be devised in other privatised industries to protect consumer interest and promote competition.

IV

Railway Privatisation

LESSONS FROM AMERICAN AND BRITISH EXPERIENCES

What lessons can we draw from the American and British experiences of deregulation and privatisation for privatising railways in general and Indian Railways in particular? First, one of the key lessons to be drawn from the differences in the American and British approach to industrial liberalisation is that it is the American, rather than the British, model which holds out more potential for encouraging competitive moves and organisational and technological adjustments in the industrial structures which are so necessary to improve productive efficiency. The American approach, as we have seen above, is based upon the ideas of contestability and sunk costs. Industries which satisfy the contestability criteria readily become candidates for deregulation and, in the case of nationalised industries, for privatisation. The British approach, although in practice it has had a multiplicity of objectives, essentially derives its intellectual origin from the theory of property rights and a system of managerial incentives. Central to this approach is the belief that private ownership is better placed to achieve productive efficiency than public ownership. This argument can, however, be questioned on a number of grounds. In the first place, there is no conclusive empirical evidence to prove that private companies always perform better than their public counterparts even where profitability and commercial success are given overriding importance. Secondly, when an industry is privatised (particularly through stock market sale), the managers of the new private company are, in many cases, literally, the same people as those who managed the old firm the day before. Thus,

as Kay and Thompson have pointed out, any change lies not in the character or abilities of the management but in the constraints and opportunities with which that management is faced. There is no intrinsic reason why these constraints cannot be eased or removed altogether or the requisite incentives cannot be offered to management under public ownership. Thirdly, the property rights approach is not best suited for reorganising the structure of the nationalised industries where considerations of allocative efficiency are as important as those of productive efficiency [Kay and Thompson 1986]. The conventional wisdom of welfare economics is that while private ownership does better than public ownership in terms of productive efficiency, it fails badly to achieve allocative efficiency. This has historically been the main rationale behind nationalisation.

The theory of property rights thus provides a valid ground for privatisation of those public enterprises where losses in productive efficiency more than outweigh losses arising from allocative weaknesses. In the British context, the privatisation of telecommunications, gas, airways, airports, etc., was justifiable, since allocative weaknesses (or non-commercial objectives) were comparatively less important. However, this theory is not enough to make a convincing case for the privatisation of the public enterprises where allocative-efficiency objectives (external effects and distributional consequences) are as important as (or even more important than) those affecting productive efficiency and profitability. Most infrastructural investments fall in this latter category, including investments in railways. The case for the privatisation of railways must, therefore, be examined within a broader framework involving incentives to both productive and allocative efficiency.

CONTESTABILITY AND RAILWAY PRIVATISATION

There is a close relationship between the degree of contestability of a given industry and the level of productive efficiency that management can achieve for that industry under a given environment. This relationship depends more fundamentally upon the nature of the industry's production function rather than the pattern of its ownership rights. Thus, industries with constant returns to scale (i.e. zero fixed costs), such as road transport, production of telecommunications or electrical equipment, fit neatly with the contestability hypothesis and so are obvious candidates for privatisation. Even industries with substantial fixed costs, like power generation, steel and coal production, satisfy the contestability conditions since the sunk costs are limited. If these industries are not doing well under public management because of wrong incentives structure, the need for productive efficiency would dictate that they should be transferred to private ownership.

where the motive for profit maximisation and the pressures of competition would obviously ensure that the industries are run efficiently. Even without bringing in the allocative-efficiency considerations at this point, the problem arises in respect of those industries where sunk costs are high and entry and exit are not costless. The classic example of this is railways, although other social overhead industries, such as telecommunication, electricity distribution, water supply (which have been privatised in the UK), also fall in this category.

Apart from sunk costs, the operation of railways is complicated by two additional factors: (i) the existence of network economies, and (ii) the extent of vertical integration in which the various railway operations are organised. Network economies arise, to a greater or lesser degree, in all forms of public transport, and where they do arise it is difficult to avoid cross-subsidy. In network industries, operations on the trunk routes are often profitable (e.g. the Intercity sector of the British Rail) but it is hard to visualise how one can privatise trunk routes without affecting the financial viability of the branch-line operations. Public subsidy is a must if branch-line operations are to be continued. The vertical integration of the rail system presents problems of co-ordinating investments in modernising and upgrading railway track, signalling and communications with those made in locomotives, rolling stock and other related equipment if, as the British government's recent proposal to privatise British Rail (1992) visualises, track operations were to be separately privatised from train operations. It would be extremely difficult and complicated to achieve co-ordinated investment in rail infrastructure and equipment in a privatised railway system in which the durations for which franchise contracts are awarded differ for track operators and service operators. In the absence of such co-ordination, there is a real danger of underinvestment in railways, not only because of the problems of matching investments in different kinds of rail technology but also because there is no guarantee that private operators would face similar incentives to invest in railways efficiently.

In fact, the types of co-ordination problems that will have to be faced in practice would depend upon the structural model adopted for railway privatisation. The British proposal for privatisation of BR considered four options: (i) privatising BR as a single entity; (ii) privatising BR along the business sectors in which its markets are presently split—intercity, Regional, Network Southeast, Trainload Freight, etc.; (iii) splitting BR into purely geographical units; and (iv) splitting BR into track and train operations, with track operations initially retained with BR

but ultimately to be passed on to an independent operator and train services to be franchised through competitive tendering. The British Government has chosen option (iv) for privatising BR. Option (i) was rejected because BR's financial losses are too great to attract takers for it as a single unit. Similarly, option (ii) was found unattractive since BR's different business sectors perform differently, some (such as intercity services) doing financially better and therefore saleable while others (such as regional services and some parts of freight business) doing badly and therefore unsaleable. Option (iii) was not found to be suitable in the UK context since a number of regional railways would have to be subsidised.

There is another reason why contestability argument does not apply so convincingly in the case of railways. The crucial motive for privatisation of a public enterprise is said to be the scope it provides for gains in productive efficiency through competition. However, railways have always been subject to severe competition from other modes of transport and have accordingly been forced by the market to focus their strengths on those areas of operation where they are particularly cost-effective, viz. long distance traffic, heavy freight and services involving large volumes of passenger traffic [Adamson et al 1991]. It is not clear therefore what extra efficiency gains the railways can expect to achieve through competition between different rail operating companies over and above those already made through inter-modal competition.

However, it might be argued that productive efficiency gains in the field of transport accrue not only from inter-modal competition but also from competition *within* the rail system itself [Rickard 1991]. This point is correct and it may be mentioned that the nature of this competition will also depend upon the actual model adopted for privatisation. For example, if privatisation were to take the form of the proposed British model, competition could be in the shape of different franchise-holders offering price reductions for similar quality of service provided or improving the quality of service offered for the same fares or both, although, since the track is owned by other companies, the service-providers will not be able to increase the speeds of their trains on their own. If, on the other hand, privatisation were carried out on the Japanese model by breaking the national rail system into independent regional companies, it is not clear how within-the-system competition can be promoted to attract traffic. There might be scope for freight operators, as Rickards points out, to run freight services over track owned by other companies and over which other services are also operated but the scope for such competition must in actual practice be limited.

ALLOCATIVE EFFICIENCY AND RAILWAY PRIVATISATION

Historically, railways have played a crucial role in the development of many countries; they are by far one of the most energy-efficient modes of transport; and for many environmentalists, they are the cleanest mode if they are run on electric traction. Even when issues of market structures and managerial performance were resolved, there would still be the question of reconciling the non-commercial objectives of railways with the commercial criteria. This question is of particular importance in a developing country like India where there is a constant demand for opening new railway lines/services which are not justifiable on purely financial criteria (or to continue operating the existing loss-making lines/services) in order to meet the transport needs of lower-income groups or promote the development of the backward areas. Such railway lines/services are operated by Indian Railways through cross-subsidy. Since cross-subsidy is not permissible within the contestability model, productivity efficiency would require that these lines/services should not be considered for new investment (or that the existing loss-making lines/services be withdrawn). If subsidy were thought necessary, it would be better to provide an up-front grant directly at the cost of the taxpayers rather than the users of the profitable lines/services. Obviously, we are treading here over the delicate grounds of public economics where value loaded welfare judgments are unavoidable. Productive efficiency is no doubt critical for the financial health of public enterprises but there are, in real life, occasions when economists find it desirable on welfare considerations to subordinate the needs of productive efficiency to those of allocative efficiency. This can happen, for example, when external effects or distributional consequences assume overriding importance in a particular context. This is precisely why economists take recourse to a social cost-benefit appraisal process to justify vital public investment decisions. Many railway investment projects implemented in the post-second-war period would not certainly have passed investment criteria based purely upon productive efficiency objectives or the financial rate of return accruing to the railways. Allocative efficiency criteria have played paramount role in the pricing and investment decision of railways almost everywhere. And it is the belief that the private ownership of the railways would not achieve allocative efficiency as effectively and efficiently as their public ownership, which is at the heart of the argument against the privatisation of railways. We consider this question in the context of Indian Railways below.

V Privatisation of Indian Railways

INSTITUTIONAL BACKGROUND

Indian Railways have been managed as a departmental undertaking of the ministry of railways in the government of India following their structural reorganisation after independence. As a departmental undertaking, they are managed by a board within the ministry whose chairman is *ex officio* the secretary to the government. In managing the affairs of the Railways, the board has been expected to achieve a certain commercial remit as we shall discuss below, but it has never been subject to any bankruptcy constraint for the Railways' financial losses. In fact, it can be fairly stated that in the post-independence period, being the backbone of the country's transport system, the performance of Indian Railways has been assessed more in terms of their success in achieving the social objectives set for them by politicians, rather than in terms of their commercial success.

The principal commercial remit set for the Railways is in respect of financial targets they are required to achieve on the capital funds provided by the central government to finance their expansion programmes. Indian Railways are not allowed to borrow money directly from the capital market to finance their investment. Their investment programmes are financed mainly by borrowing from the central government but partly also through internal generation of resources. Capital funds borrowed from the government are *not* in the form of grants (as, for instance, in the case of British Rail in the UK) but in the form of non-refundable loan on which they have been required to pay, right from the time dating back to the 1924 Separation Act, a fixed rate of dividend (around 6.5 per cent) to the government. Besides, the Railways are also been required to make a definite contribution to the General Revenues of the central government, perhaps as a *quid pro quo* for the funds provided to them at a concessional rate. These requirements have, of course, been subject to review from time to time on the basis of the recommendations of Railway Convention Committees. In actual practice, however, these requirements have hardly been met. As the Railways have come under increasing financial pressures, partly from competition from other modes of transport and partly also from the various policy constraints imposed upon them (e.g. the uneconomic tariff policy forced upon them by the government and the various social burdens they have been required to carry), their dividend obligations have accumulated over time into a huge indebtedness to General Revenues [see the reports of the Expert Group on the Capital Structure of Indian Railways 1978 and the

High Level committee on Social Burdens on Indian Railways 1979].

Despite these constraints, the need for operating Indian Railways as a commercial undertaking on sound business principles has never been lost sight of in policy-making circles in India. The reports of the Railway Convention Committees and the various inquiry groups that have gone into the Railways' financial and pricing policies have highlighted the importance of operating the Railways as a commercial enterprise. None of these committees have, however, spelled out in precise terms exactly how to run the Railways on business principles while retaining their character as a departmental undertaking and, at the same time, carry on the various obligations imposed on them by the government in the pursuit of its social objectives. We are, once again, faced with the dilemma of reconciling the commercial objectives set out for Indian Railways with the social and allocative efficiency concerns which the Indian government has sought to pursue in operating the country's railway system.

The key question to pose then is whether in the light of the institutional environment in which Indian Railways operate and the conflicting policy objectives set for them by the government, can one really make a sensible case for their privatisation? Being a departmental undertaking, the Railways have practically no effective control over their investment and pricing policies. For all practical purposes, their investment programmes are determined by the Planning Commission while their pricing policy is subject to parliamentary control. Now, the case made by the proponents of privatisation is as follows: In today's competitive environment, unless the Railways enjoy full freedom to control their pricing and investment policies, improve their productivity and provide the type of service their customers want, there is little hope of their financial survival. A revolutionary change is therefore called for in the structural organisation of Indian Railways, involving new managerial practices, operational procedures and profit-oriented work ethics. Such a structural change in the Railways' administration can only be brought about, according to the proponents, by their privatisation. Privatisation will transfer control over their pricing and investment decisions from the hands of the precedent-bureaucrats to those of an independent, professionally-minded board of directors, who would presumably manage them, depending upon the incentives structure offered for them, in the best interests of their customers as well as their shareholders. They must bear their customers' interest in mind, otherwise they would lose them to their competitors. They must also satisfy the expectations of their shareholders for a fair

return on their investment because, according to the agency theory, the shareholders are the principals who engage them to run their business. A privatised management structure for Indian Railways would thus be best suited to optimise the objectives of both the consumers and the shareholders.

This argument is undoubtedly unassailable in terms of the economic theory of property rights. The central focus of this theory is to determine an optimal incentive structure for the principal to lay down for their agents to maximise the internal efficiency of the firms. Can Indian Railways be operated within the framework of principal-agent relationships while still functioning as a public industry? The Railways have historically played a crucial role in the country's economic development and socio-political integration. They have also carried a number of social obligations to fulfil the government's non-commercial goals. If Indian Railways were to operate within the framework of principal-agent relationships, the central question to address would be how to account and pay for the benefits enjoyed by the country from the non-commercial output produced by the Railways. Now, there is no methodological problem so long as the Railways' entire equity capital is subscribed by the central government. For then the principals whose interests the Railways would serve would be the taxpayers themselves. There would be no conflict of interests since the taxpayers can determine, through voting process, the amount of non-commercial output the Railways should produce. The problem arises if the Railways' equity capital were entirely held by private investors, which naturally would be the case under privatisation. For then the agents (i.e. the management) operating the Railways would not find it in their interests to fulfil the social objectives of the government. On the other hand, it would be in their interests to maximise the commercial output of the Railways, as this would give maximum return to the principals on their investment. If the Railways were still required to carry their social burdens, the costs of these burdens should fall, according to the proponents of privatisation, upon the taxpayers and not the users of the railways. For, otherwise this would amount to cross-subsidisation.

There is a good economic case, in the present-day conditions, for shedding a large number of the social burdens of Indian Railways. These burdens need to be carefully reviewed so that a correct financial strategy might be evolved to meet their costs without burdening the finances of Indian Railways. The crucial issue to ponder is whether Indian planners and policy-makers can afford to sacrifice the allocative efficiency and equity-distributional objectives which the Railways have been required to pursue in

the interest of the country's development. Many Indian planners believe, in my judgment, that the pursuit of these objectives is still important for India's socio-economic development. If this view is correct, then it is clear that a privatised railway system would not be able to achieve these objectives as efficiently as would a publicly owned railway system.

PRACTICAL PROBLEMS

Even if we set aside the allocative-efficiency issues associated with the privatisation of Indian Railways and concentrate only upon productive-efficiency aspects, the case for privatisation is still difficult to justify because of the non-applicability of the contestability model to the Railways. First, because of the technical indivisibilities of their assets, investment in railways are huge and chunky, requiring resources usually beyond the reach of private investors. However, as has been mentioned in the theoretical section of this paper, it is not the size of fixed investment that acts as a deterrent to private investors from entering an industry but the 'sunkness' of the costs. Almost all investments in railway assets, including not only investments in tracks but also in locomotives and rolling stock, are sunk costs because of the specificity of use of railway assets. If Indian Railways were to be privatised as a single entity, it is difficult to visualise how private investors can afford to commit resources on such a large scale to purchase assets which cannot be easily disposed of if the demand for rail traffic declines. This problem will arise no matter what model were adopted for privatisation. For example, even if the model proposed for the privatisation of BR were adopted, in which the operators acquiring franchises to operate services can rent locomotives and rolling stock instead of purchasing them, the company (or companies) supplying these assets will be lumbered with huge sunk costs, should the demand for railway service decline. The very logic of the contestability theory militates against the privatisation of the railway system not because the requirements of funds for fixed investment are enormous and often beyond the means of private investors but because sooner or later the investments are likely to be "sunk" because of the risks and uncertainties involved in a mode of transport whose market has been progressively eroded by inroads from other modes of transport.

Secondly, the operations of Indian Railways are probably more vertically integrated than those of many other railways in the world. For example, most of the equipment required to operate their line-haul system, including signalling and communications, locomotives and coaches, are manufactured by Indian Railways within their own integrated workshops. The Railway

Board in consultation with the Planning Commission co-ordinates the various components of the Railways' investment programmes to ensure technical and operational compatibility between line-haul assets and rolling stock equipment, so that there is no mismatch in the facilities developed. Indeed, the co-ordination problem goes much beyond merely ensuring technical compatibilities between rail equipment. As Helm and Thompson (1991) have pointed out, privatisation may lead to under-investment in the transport sector, particularly in the creation of long-lived facilities and equipment, if privatised companies faced inadequate incentives to invest efficiently. Indian Railways have already been facing this problem in respect of the production of wagons which, unlike locomotives and coaches, is carried out in the private sector. Whenever the demand for wagons has fallen and manufacturers had surplus stock on hand, they have found it hard to trust the Railway Board's forecast of the future demand for wagon capacity. This has caused difficulties in matching investment in wagon manufacturing capacity with the Railways' wagon stock expansion programmes. However, since the scale of sunk costs in the production of railway equipment is not as prohibitive as in the creation of line-haul assets, one might make a good case, using contestability argument, for privatising as well the production of locomotives and coaches required by Indian Railways, provided enough care is exercised for ensuring adequate investment in, and the requisite compatibility of, the rail equipment manufactured by private companies.

Another operational problem the privatisation of Indian Railways will certainly throw up relates to the difficulties involved in the timetabling process. The co-ordination of the timetabling process is a difficult task in every railway system but considering the size of Indian Railways' network, it would be impossible in practical terms to replicate this process through market mechanism. As Adamson, et al (1991) point out, if, for example, the rights to train paths were bought by one company, this would affect its requirements for platform access and rolling stock starting at a terminus being shared with other operators. The availability of platform space at a given time would in turn affect the availability of paths on other routes, and so on. Hence all scarce capacity which critically affected other stress points on the network would have to be simultaneously commercially traded and subsequently operated in a co-ordinated manner to ensure efficient competition. The interdependence inherent in train planning would make timetabling a tortuous process in a privatised regime, unless the whole railway system were handed over to a private operator as a single entity. Any other model adopted for

the privatisation of the Railways would have to face this problem.

STRUCTURAL MODEL FOR PRIVATISING

If Indian Railways were to be privatised, despite the reservations expressed against their privatisation above, it would be instructive to speculate which of the various models proposed for rail privatisation would be most appropriate for them to adopt. As I had mentioned earlier, the British proposal for the privatisation of BR had considered four possible options, viz, (i) privatising BR as a single unit, (ii) privatising BR along business sectors, (iii) breaking and privatising BR as regional companies, and (iv) splitting BR into track and train operations, and franchising train operations separately through competitive tendering. The British Government has selected the fourth option for privatising BR. On the other hand, except in the case of freight operation, the Japanese government chosen to break JNR's passenger service network into six regional companies for privatisation. The freight business was privatised as a single unit and handed over to a nationwide company to operate. For the privatisation of Indian Railways, the best model often suggested is the Japanese one. The preference for the Japanese model is based upon the fact that Indian Railways are already organised on a zonal basis, with each of the nine zonal Railways functioning more or less as a separate operating and costing unit. All the same, it must be remembered that the nine Zonal Railways are very closely integrated not only in terms of their ticketing and timetabling operations but also marketing and business operations and so, if they were to be successfully privatised, it might be necessary, as a preliminary step to privatisation, to run them for some time as independent business units in order to test their financial viability individually. It may not be practical to sell all the zonal companies simultaneously; the government should start selling the most profitable companies first as these would be in a better position to attract private investors and then the less profitable companies, and so on. The loss-making zonal railways, such as the North-East Railway, probably may not find takers in the private sector.

The privatisation model, suggested above, would eliminate the need for cross-subsidisation between different zonal railways, since each zonal company would be operating on its own. But it is likely to raise a number of operational problems for the government. First, since not all zonal companies are likely to be financially equally viable, the government may have to subsidise from the central revenues those companies which do not have enough traffic to cover their operating costs. Secondly, under a privatised regime, the government would have to offer outright grants to the operators

for the various social obligations borne by them at the instance of the government. These obligations were previously financed by Indian Railways through cross-subsidisation, including the operation of loss-making commuter services in the metropolitan areas. Thirdly, the government would be faced with the problem of maintaining uniformity in the technical standards and the levels of service-quality achieved by different zonal companies. This is because since the financial strength of the different regional companies would not be the same, the rate at which different companies would be able to absorb new technologies or modernise their equipment would differ, thereby creating technical disparities in the country's railway network. If the zonal model were adopted for the privatisation of Indian Railways, all these problems must be carefully addressed and suitable remedies devised to deal with them before embarking upon the privatisation programme.

The other privatisation models are less suitable for Indian conditions. For example, the business-sector model is not possible for Indian Railways since their operations are not structured on business-sector lines as in the case of BR. One may, all the same, visualise a scenario of privatising Indian Railways' most profitable long-distance intercity passenger or freight services to start with, as these are most likely to attract private operators, leaving the less profitable business for sale later and the Railway Board to operate only the loss-making services with financial support from the central exchequer. One wonders if the Indian government would be prepared to entertain such proposal, if only because it would raise the most insurmountable difficulties of allocating joint costs as both the profitable and non-profitable sectors would be using the same tracks and other common assets. Moreover, the idea of hiving off the profitable parts of the Railways' businesses to private operators, leaving the Railway Board with the loss-making services to run, may sound bizarre to many policy-makers.

It is true that the modern trend in both developed and developing countries is towards deregulation and privatisation of their industrial structures. I welcome the policy of deregulation in every sector of the Indian economy, since I believe that such measure would open up new opportunities for both producers as well as consumers – for producers to adopt new technologies and engage in the production of whatever goods and services they find most profitable to produce and for consumers to consume whatever goods and services give them maximum satisfaction. While deregulation is most welcome in every sector of the Indian economy, including the transport sector, any proposal for the privatisation of Indian Railways must be carefully examined. Such

examination must not only take account of the effects of privatisation upon the productive efficiency of the Railways but also the equity-allocational objectives of the government. And even while focusing upon productive efficiency objectives, it would be essential to give careful thought to the various operational problems highlighted in this paper. Otherwise, privatisation might as well open a Pandora's Box for the Railways rather than solve any of their productive efficiency problems.

VI

Indian Railways as a Corporation

While I reject privatisation as a solution for improving the productive efficiency of Indian Railways, there is much to be said in favour of changing their structure from a departmental undertaking into an independent public corporation. The establishment of such a corporation, if properly structured and armed with adequate powers for making decisions on such key variables as pricing and investment, would, in my view, provide the management of the Railways the necessary freedom to run their operations on sound commercial principles.

This proposal has been a subject of much public debate in the past but no action has been taken due to pressures from the vested interests. I believe it would not be out of context in the privatisation debate to restate the case for converting Indian Railways into a public corporation under the ministry of railways. I intend to devote the final section of the paper towards this end.

The case for choosing a corporate structure for the Railways was examined in detail by an Expert Group on the Capital Structure of

Indian Railways set up by the ministry of railways in 1978. The group had cited the following advantages which the Railways would enjoy if they were to operate as a public sector corporation:

- (i) As a corporation, they would have chosen their capital structure so as to finance as much of their investment as possible by raising equity, thereby keeping their loan liabilities to a minimum.
- (ii) They would have greater flexibility in fixing their fares and freight rates, and relating them as far as possible to costs.
- (iii) Since they would have been under pressure from their equity holders to break even, they would not have continued with their unremunerative operations.
- (iv) They would have invested more on innovations and modernisation of their capital equipment in the face of competition from other modes of transport in order to reduce their operating costs.

Unfortunately, the expert group considered that the question of ownership of Indian Railways was beyond its terms of reference and accordingly decided not to make any specific recommendations in this regard. However, it had raised some important policy issues which are equally relevant in the present context. The group, of course, looked at the question of converting the Railways into a public corporation from the viewpoint of restructuring their capital base rather than giving the Railways an autonomy for decision-making without ministerial interference. In India, public sector undertakings, which are organised in the form of corporations, have their capital structure as a mixture of equity and loan capital. However, being a departmental undertaking, the entire capital base of the

Railways is in the form of non-repayable, but interest-bearing, loan from the central government.² Interest (dividend) payments are exempted on certain segments of railway investment on the recommendations of Railway Convention Committees. Thus, as has been observed earlier, although they do not have to repay their loans, Indian Railways are required to pay to the central government a fixed dividend of around 6.5 per cent on their loan capital, whether or not they made profits. Since a large part of their capital has been financed by borrowing from the government rather than internal savings, the Railways' financial structure has been highly over-capitalised. The expert group wanted to relieve the Railways of this anomaly in their capital structure. By converting the Railways into a public corporation, it would be possible, the group argued, to convert part of their fixed interest-bearing liabilities into equity, thereby releasing the Railways from an obligation to pay a predetermined dividend.

There is, however, a fundamental difference between the equity capital provided by private investors to a joint stock company and that provided by the government to a public sector corporation. The equity shareholders in a joint stock company can always withdraw their capital, by selling their shares on the stock market, if the company is losing money but this option is not available to the government in relation to a public sector corporation. Equity capital given to a public corporation, therefore, amounts effectively to an outright grant if it is losing money and must therefore be treated on the same footing as a grant from taxpayers to a departmental undertaking. According to the theory of ownership rights, there is no bankruptcy constraint on a public sector corporation whose shares are not freely traded on the stock market. From this point of view, the requirement to pay a fixed dividend on their loan capital imposes on the Railways, at least in theory, an obligation to earn a surplus over their operating costs. The Expert Group, accordingly, concluded that "unless according a corporate status to the Railways means complete autonomy to them in their pricing and investment decisions, so that the fares and freights fixed by them reflect the real cost of providing their service, there is no reason how the mere restructuring of the Railways' capital on the equity principle would help the Railways in getting out of their present financial plight."

As has been observed above, the expert group looked at the question of according a corporate status to the Railways from a rather narrow standpoint of changing the capital base of the Railways. The group, therefore, came to a negative conclusion on this issue as it believed that the mere conversion of railway capital into state-owned equity would have no consequence on the

Railways' financial position. However, to my mind, the importance of the issue goes much beyond its impact on the restructuring of the railway capital. It assumes special importance in the context of the privatisation debate. For the accord of a corporate status to the Railways is likely to bring about a fundamental change in the relationship between the management of the Railways and the government. The nature of this relationship would depend upon three factors: (a) what sort of corporate objectives the management is required to optimise? (b) what degree of freedom the managers enjoy from ministerial control in managing the affairs of the Railways? and, (c) what kind of incentive scheme the management has been offered to optimise the Railways' corporate objectives? In the conventional model of the nationalised industries, the standard approach has been to regard managers as the trustees of the wider public interest, and expect them to manage public enterprises by optimising some form of social welfare function. The 'public interests' theories are, however, of little relevance to the present-day conditions. A more useful approach would be to look upon public corporations in their role as developed in the theory of property rights.

This theory, as has been outlined earlier, presumes the managers of corporations as agents who serve the interests of their principals, viz. the shareholders, who supply capital to the corporations. In a perfectly competitive markets, the managers also automatically satisfy the interests of their customers by meeting their demand at a minimum cost, but this need not be the case if the markets are less than perfectly competitive. Now, the question to ask is: can the principal-agent theory be applied to public corporations, even if private investors were allowed to own only a sizeable part of their share capital? The answer will depend upon three major factors, viz., (a) the size of shareholding the private investors are allowed to hold – generally, the larger the size of this holding, the more effective would be the stock market control on the operations of the corporations; (b) whether the shares of the corporations held by the public are allowed to be traded on the capital market; and (c) the extent of managerial autonomy provided in the statutes setting up these corporations.

Presently, the equity capital of the Railways is, as we have noted above, entirely owned by the central government, which implies, *ipso facto*, that the 'principals' whose interests the railway management must serve are the taxpayers. If the Railways were accorded a corporate status, it will be crucially important that the structure of the proposed corporation is modelled to fulfil the three conditions mentioned in the previous paragraph. For example, if the equity capital of the proposed Railway

Corporation were entirely held by the central government, as in the case of a departmental undertaking, the framework of control over the operation of the Railways would be no different from the existing ministerial control and bureaucratic intervention. Such system would not be conducive to injecting commercial procedures and market discipline into the management of Indian Railways. An important and innovating breakthrough in the structural model of public corporations in India would be to invite private sector to freely participate in their equity base. Such a structural reform has already been introduced by the present Indian government by inviting the private sector to purchase up to 20 per cent of the share capital of a number of selected public corporations. The same structural model should be adopted for the Railway Corporation by inviting private investors initially to purchase 20 per cent of the Corporation's share capital, but gradually this share should be raised to 49 per cent. This would still leave the control of the Railways with the central government, if so desired.

If Indian Railways were converted into a public corporation on the above lines, it will, in my view, go a long way in revolutionising their managerial practices and operating procedures and bringing about technological changes which are so vital for improving their productive efficiency and financial health. I strongly support the case for converting them into a public corporation. In such a corporation, the central government would hold the major share of its equity capital but by offering private sector an opportunity to acquire a sizeable part of its equity base, the government would expose the Railways, at least partially, to the financial discipline and the shareholder monitoring of the capital market. However, to obtain the full benefits from the structural change suggested in this paper, two further requirements would be in order: (a) suitable provisions in the statute setting up the proposed Rail Corporation in order to ensure the managers necessary freedom from ministerial intervention, so that they may manage the business of the Railways on commercial principles, (b) and a properly structured incentive scheme for the managers to optimise the corporate objectives set for the Railways. There is no room in this paper to go into these modalities, which should best be left to the experts to work out.

VII Conclusion

The Indian government has adopted a liberal approach in its economic and industrial policies. Liberalisation implies deregulation of industrial structures and abolition of all forms of licensing and restriction on the

entry and exit of firms in every sector of the economy. It does not necessarily mean denationalisation or privatisation of public enterprises. In fact, public and private enterprises can coexist and compete with each other in a deregulated economy, and there can be competition between different public corporations themselves in a given industry without any involvement of the private sector. But where public corporations are not performing satisfactorily and there is a hard empirical evidence that the private sector can do better, there may be a good economic case for handing over such corporations to the private ownership and management.

A number of activities in India's transport sector may fall in this last category. For example, there is no economic justification for reserving intercity road passenger transport exclusively for the public sector, as it happens in a number of Indian states, and public interest will be better served if state road passenger transport corporations are exposed to competition from private operators by deregulating the road passenger transport industry in these states. Similarly, there is a good economic case for deregulating India's domestic airline services and privatising the third airline service, the Vayudut, which has been running into losses. Markets in these sectors of transport are contestable as sunk costs are negligible. The same, however, cannot be said about rail transport, as has been discussed in this paper. But the case against the privatisation of Indian Railways goes much deeper than that. My case against privatisation was not only based upon the non-applicability of contestability theory to the Railways and hence the lack of any gains to the Railways in productive efficiency but also the fear that privatisation would, in fact, entail losses of allocative efficiency and other non-commercial gains the country has enjoyed from the historical role the Railways have played in its socio-economic development.

While I have opposed the idea of privatising Indian Railways, I have argued for converting their structure from a departmental undertaking into a public corporation, with its equity capital open for private sector participation. I believe such structural change in the Railways' corporate status, with statutory provisions to ensure the management freedom from ministerial interference, would go a long way in ensuring their commercial success, while simultaneously enabling them to continue to fulfil their social objectives.

Notes

[This paper was presented to a seminar organised by Railway Fare and Freight Committee and Institute of Social and Economic Change at Bangalore.]

- 1 The equity capital of these companies is held by a state holding company which has not yet offered it to the public.
- 2 Recently, the Railway Finance Corporation, a subsidiary of Indian Railways, had issued 9 per cent tax-free bonds which were mainly subscribed by financial institutions.

Economic Reforms in Developing Countries

Theory and Evidence

Nirupam Bajpai

Economic reforms are being undertaken almost throughout the developing world today, preceded in most of the countries, including India, by a fiscal and balance of payments crisis. It is argued that the reforms are guided by rules-of-thumb and the underlying general equilibrium model of the economy for which these standard rules apply is an unrealistic portrayal of most of the developing economies. The model holds good only under very restrictive assumptions, perhaps only for small economies and not large ones. Besides, while it is important to attain and maintain fiscal discipline, the IMF's approach has prolonged the process and invariably failed to yield the desired results.

I

Introduction

ALMOST throughout the developing world the introduction of market-oriented reform agendas have been put in place under the auspices of the International Monetary Fund (henceforth Fund) and the World Bank (henceforth Bank). While the Fund's focus is essentially short-term stabilisation, the Bank has focused on realising longer term structural adjustment in all developing and now quite a few erstwhile socialist economies. Structural adjustment is used to promote the marketisation of economies through reliance on market signals to guide economic decisions and allocate resources. As part of this agenda, the Bank goes on to seek structural reform built around deregulation, import liberalisation, marketisation, and privatisation of the national economy.

In the initial stages, emphasis of the reform programme is on stabilising the economy with fiscal restraint and currency devaluation taking the leading role. Having stabilised the macro-economic environment, it is suggested that the emphasis should shift to structural adjustment encompassing various micro-economic and institutional reforms in order to remove inefficiencies and to ensure an adequate rate of growth. However, this set of sequence is not being followed in the last five-seven years since both the Fund and the Bank are operating simultaneously and hence the broad sequencing of stabilisation and then reforms is no longer adhered to.

While most developing country governments' economic reform programme adheres to an orthodox pattern associated with the Fund, the Bank, and the mainstream western macro-economic profession, some other countries are struggling, with varying degrees of success, to chart their own course. However, there appears to be a broad consensus among economists and policy-makers regarding the applicability and effectiveness of the Fund/Bank programme or what is often called the stabilisation-cum-structural adjustment package.

An attempt is made in this paper to assess the extent of theoretical and empirical support behind economic reforms. The rest of the paper is organised as follows. While Section II deals with the broad sequencing of stabilisation and then reforms, Section III discusses the rules-of-thumb approach. Trade policy reform and related issues are analysed in Section IV. Distinction between allocative and productive efficiency at the micro level is discussed in Section V. Section VI lays emphasis on a novel three-gap adjustment model (for savings-investment, trade, and fiscal limitations) at the macro level. Concluding remarks are presented in Section VIII.

II

Stabilisation, then Reforms

Although both the Fund and the Bank have been emphasising that stabilisation should precede structural adjustment, in practice, both stabilisation and structural reforms are found to be going on simultaneously. An important reason for this is that the Fund's approach toward stabilisation results in a long drawn process primarily due to the neglect of crucial macro-economic factors, such as linked foreign exchange and fiscal constraints, financial fragility, and the dynamics of the inflation process. By implication, therefore, the results of Fund-supported programmes have been far from satisfactory.

Studies have found that the Fund's programmes have not been optimal for stabilisation, growth or income distribution. Most Fund-sponsored programmes relied heavily on cuts in real wages and devaluation of the exchange rate. However, we argue that the former usually resulted in further declines in aggregate demand and growth while the latter resulted in higher inflation and drops in production. The elasticities of substitution in consumption and production were usually very low, hence consumers did not quickly switch to cheaper domestic goods, nor did producers switch quickly to the export sector.

Furthermore, the Fund's contention that large improvements were seen in the programme implementing countries in the post programme period is debateable. First, the Fund's programmes have not yielded the desired results on the price stability front. Also, the use of fiscal deficit by the Fund as the sole indicator of fiscal correction may not be correct. The conventional budget deficit and revenue deficit would perhaps be more relevant. In India, for instance, the key area for action is the reduction in the revenue deficit. The growing revenue expenditure and the resultant revenue deficits may pre-empt a large part of household savings that could be invested. Second, whatever improvements are seen in the balance of payments are because of: (a) drops in imports as aggregate demand falls dramatically, rather than higher exports and (b) the infusion of fresh external resources due mainly through the Fund itself, and the resumption of new lending through commercial banks and in some cases relatively greater direct foreign investment.

Accompanying the Fund's stabilisation programme are the Bank's Structural Adjustment Loans (SALs). Contrary to what the Bank had always maintained, that is, structural reforms would be undertaken only in an environment of macro stability, World Development Report (1989), in reality, this is not the case. Both the Fund and the Bank are, in fact, operating simultaneously in the developing countries and in the process are neither able to achieve macro stability nor restoration of sustainable growth, especially in the Latin American countries Bajpai (1993).

Both policies result in a 'competition for instruments', where what is required to succeed on one front is the opposite of what is needed to succeed on the other. Historical evidence from successful Asian exporters suggest stabilisation should be consolidated before attempting trade reforms Sachs (1987). Moreover, since inflation generates serious distortions, liberalisation will take place under inappropriate signals. Hence, the need to bring down inflation first Fischer

(1987). In countries with high inflation where stabilisation requires the use of exchange rate as a nominal anchor, it is preferable to postpone trade reform until the economy has attained a reasonable degree of macro stability.

Data in Table 1 suggests that despite having implemented orthodox policies for over a decade, the economies have continued to suffer from macro instability and low rates of economic growth. While it is argued that South Korea, Chile and Turkey are success cases of orthodox reform policies, this, in our view, is not entirely true. South Korea's success, to a large extent, is attributable to its state, which developed the necessary infrastructure, human resources, and intervened in the process of resource allocation so as to achieve overall development. As the Korean economy grew, with a strong industrial base, the Koreans gradually undertook liberalisation, and rightly so. It made sense for them to open up since it was the only way to ensure further growth of the economy. Chile can hardly be called a success since a few years of strong export growth is by no means an indicator to suggest that the reform programme has succeeded. Moreover, Chilean exports (largely copper and primary products) are growing not because of the orthodox policies, but due to the heavy investments made by the state in the copper mines over the last 10-12 years. Turkey, on the other hand, is facing serious macro problems today, and a few years of stable growth in between (which is not sustainable) cannot be termed a success case.

III

Economic Policies Guided by Rules-of-Thumb

Most of the economic policies advocated by the Bank, and asked for in return of SALs are guided by rules-of-thumb. The underlying general equilibrium model of the economy for which the standard rules apply is an unrealistic portrayal of most developing economies. Devarajan and Lewis (1992) construct a simple two-sector model to highlight the critical assumptions for different rules-of-thumb, and it demonstrates what happens to the standard prescriptions when these assumptions do not hold. However, we focus in this paper on trade and exchange rate policies in the currently pursued adjustment strategy.

In the macro-economic arena, governments are asked to 'get the exchange rate right' by maintaining an appropriate real exchange rate. Appropriate adjustments in the exchange rate are identified by conventional wisdom as those required to offset the difference between domestic and world inflation. Similarly, in the area of trade reform, the

focus is on the level and pattern of import tariffs. Government are advised to lower the average level of tariffs, and reduce or eliminate the dispersion of rates across different commodities. Also, it is suggested that quota restrictions (QRs) should be removed from intermediate inputs, capital goods, and other non-competing imports as also from a variety of final goods that do compete with domestic production.

Fund programmes bear testimony to the fact that exchange rate reform has been a nearly universal element in the standard package prescribed for developing countries. Exchange rate policy focuses on two distinct issues: first, changing the level of exchange rate (usually through a devaluation) in order to reduce pressure on the balance of payments and to remove distortions in the relative price of tradables and non-tradables, and second, managing movements in the exchange rate in order to minimise the impact of adverse external developments. While it may be true that major exchange rate adjustment is required to reduce the distortions between tradables and non-tradables, rules-of-thumb are, however, of little use in providing a guide in such cases. Often it is the case that policy-makers proceed by trial-and-error in choosing how large an adjustment should be made, of course, political feasibility often constraining the choice.

It is believed that maintaining a competitive exchange rate is one of the most important guarantees for achieving a sound closure of the external gap. Since the pre-stabilisation situation, often, but not all the times, includes an overvalued exchange rate, it becomes necessary to devalue early on. However, devaluation has complicated, economy-wide effects. By increasing import costs, it may be price inflationary and output contractionary (Agenor (1991), Krugman and Taylor (1978)). Recent experience in Tanzania and Ghana suggest that capital inflows provided to support devaluation can be used to reduce excess demand by allowing intermediate imports and production to rise, with a corresponding reduction in inflation. A reasoned judgment about the likely effects of devaluation is essential in the design of stabilisation programmes. If any rule applies, however, it might be that small, open economies which are externally constrained are more likely to respond favourably to a devaluation/capital inflow package than are large, closed ones.

The co-ordination of devaluation with other policies is also problematic in the context of both stabilisation and adjustment. For anti-inflation purposes, the exchange rate may be frozen as a nominal anchor. Of course, if inflation continues there will be real currency appreciation, and consequently imports will rise and export growth decline

thereby upsetting the real side of the economy as in numerous failed stabilisation attempts in Latin America over the past two decades. With regard to fiscal policy, if depreciation is expansionary, then it can usefully be combined with austerity. The exchange rate change improves the trade balance, while fiscal policy helps avoid an inflationary excess demand situation. However, in the event of a devaluation being contractionary, which is most often the case, combining it with fiscal austerity can lead to disastrous results.

Furthermore, devaluation by itself cannot improve the trade performance. Getting rid of extreme price distortions appear to be a necessary condition for (or at least correlated with) greater tradability of domestic activities. However, mere price incentives are never sufficient for improvement in trade performance. A real exchange rate with a reasonable, stable value is an invaluable stimulant to net exports. Of course, it must be supplemented with directed trade promotion policies, such as tax drawbacks, export subsidies, and cheap credit, etc., as well as state intervention to improve infrastructure. The real exchange rate could be held stable by following a crawling peg policy involving frequent nominal mini-devaluations to keep the exchange rate in line with the domestic price level. Briefly put, the simple rules-of-thumb are inappropriate if a complex representation of the economy is adopted. Only under very restrictive assumptions is the simple exchange rate rule appropriate. For example, a rule used for real exchange rate policy makes sense only when the balance of trade is zero or for instance unifying tariff rates is efficiency improving only when all other taxes are set optimally.

IV

Trade Policy Reform

Trade policy reform is perhaps one of the most crucial components of the currently pursued adjustment strategy. It is argued that developing countries need to move away from a distorted trade policy regime toward a more neutral one. As part of the move toward a more liberal regime, a standard sequence of policies is recommended: first, there should be macro stability; thereafter, quotas should be converted into tariffs, and then the tariff schedule should be simplified to two or three rates in the 10-50 per cent range, sufficient to provide some protection and generate revenue (for country details refer to Table 2). By contrast, experiences of many countries have shown that sustained output growth is possible even with a distorted trade regime, and moreover, most

formal models show that eliminating distortions is likely to be of second order significance anyway.

While the orthodox view has maintained that trade liberalisation and currency devaluation are crucial to attain and more importantly sustain higher levels of economic growth, we argue, on the other hand, that trade policy orientation may not be a dominant determinant of growth and hence may not perhaps deserve the attention being given to it. Several authors including Rodrik (1992) and Krugman (1989) have emphatically suggested that multiple equilibria are possible with trade reform. With low investment level in the economy, the probability of reform collapse is high and similarly another equilibrium point exists wherein the investment level needs to be sufficiently large to bring down the probability of collapse.

Programming the level and composition of non-competitive intermediate and capital goods imports has been a key factor in the success of developmentalist states. In South Korea, for example, authors of diverse viewpoints agree that instruments, such as quotas, directed credits, and targeting were used to promote import substitution which led to export growth. Similarly, Brazil used

protection and licensing to build an automobile sector which flourished until the economy was derailed on the macro front in the 1980s. Turkey, Colombia, and Kenya have proved to be successful exporters primarily due to their policies of import quotas and export subsidies which directly focus on exports.

Furthermore, the objective of trade liberalisation is in direct conflict with the objectives of reducing the balance of payments deficit and the budget deficit [Bajpai 1990]. Tariff reduction typically results in reducing government revenue and simultaneously increasing the import bill. This, in turn, increases both the budget deficit and the balance of payments deficit. In Mexico, for example, the trade reform reduced by half the share of trade taxes in the total government revenue and magnified the requisite fiscal retrenchment. Moreover, in Thailand and Morocco, tariff reductions were ultimately reversed, to a large extent, for budgetary reasons.

Similar to the case of exchange rate policy, the traditional rules-of-thumb with regard to trade reform are appropriate only for highly simplified model economies. In the process, the standard rules of tariff reform tend to neglect certain crucial aspects

about the underlying economy. Typically, tariffs are ignored as an important source of revenue for the government and also the fact that there may be other domestic taxes in the system. In addition, the reform programme also ignores the fact that imports and domestically produced goods in the same sector may not be perfect substitutes. Country studies in Taylor (1993) have shown that reducing tariff levels do not always help exports and that reducing the dispersion in tariff rates does not necessarily improve efficiency.

V

Allocative vs Productive Efficiency

The structural adjustment programme typically encompasses various micro-economic and institutional reforms in order to remove inefficiencies and to ensure a high growth rate. While structural adjustment is a multifaceted process, the currently pursued approach emphasises the role of economic liberalisation. The argument underlying the case for economic liberalisation is that allocative efficiency can be improved by lifting controls in the markets for commodities, credit and foreign exchange. The removal of price distortions is expected

to enhance efficiency by calling forth an appropriate behavioural response. We argue, that although allocative efficiency gains do accrue with the removal of distortions, but they are only a one-time gain. Reallocation of resources to the sectors where they are most productive at world prices would lead to a once-and-for-all gain in the efficiency of the economy [Krugman 1989]. Such a reallocation can explain only a one-time gain, however, not a continuing process of growth. Besides, Krueger (1985), one of the strong advocates of the liberalisation policies admits "...while there were numerous micro-economic changes that accompany devaluation, liberalisation, and altered (trade policy) bias, it was not possible to detect significant effects of these changes on growth performance".

At the micro-economic level it is important to distinguish between "allocative" and "productive" efficiency gains. With regard to industry and finance, Hjalmarsson (1991) and UNCTAD (1991) respectively make a distinction between allocative and productive efficiency. The latter is by no means assured by removing price distortions to put allocative efficiency into place. There are several other factors which affect productive efficiency, for instance resource endowments as defined by changing technology and tastes, market and capital stock structures, the size of the economy, access to geopolitically determined capital inflows and penetrable markets. Moreover, gains in allocative efficiency via changes in real macro prices, such as wages, exchange rate and the interest rate can be misleading, if improvements in productive efficiency are trivial at best. Also, movements in their nominal counterparts have complicated and economy-wide effects Taylor (1993).

Increases in GNP can be registered while the one-time reallocation of productive factors lasts and hence it may be incorrect to presume that liberalisation can raise the rate of growth over the medium to the long run. However, one comes across overwhelming literature favouring across-the-board liberalisation to attain and more importantly sustain higher levels of economic growth. Be that as it may, the theoretical underpinnings of the liberalisation policies seems to be rather weak. For example, it is significant to distinguish between (a) an increase of, say, 2 per cent in GNP every year, and (b) a permanent increase of 2 per cent in the growth rate of GNP. The economic theory underlying the case for liberalisation makes a claim only regarding the first scenario. The practical difference between the two scenarios can be observed by noting that an economy with an underlying growth rate of 4 per cent a year will have a GNP

under scenario (b) that is almost one-fifth larger at the end of a decade than under scenario (a) [Lucas 1989].

Perhaps an analogy could be drawn between what we have discussed earlier, i.e. 'allocative' and 'productive' efficiency on the one hand with 'level' effects and 'growth' effects respectively on the other. Qualitatively, the 'neoclassical' growth model makes a distinction between the level and growth effects. The former are the

changes that raise or lower balanced growth paths without affecting their slope, while the latter are changes in parameters that alter growth rates along balanced paths. The structural adjustment programmes suggest that developing countries should remove import quotas and reduce their import tariffs significantly since these are inefficient barriers to trade and hence act as a limitation on growth. However, removal of trade barriers as per the neoclassical

TABLE 2 TRADE POLICY REFORMS IN SELECTED DEVELOPING COUNTRIES

Argentina:	Trade liberalisation began in 1986 and accelerated in 1991 when virtually all QRs were removed (except on automobiles). Stabilisation programmes were launched in 1989 and 1990 which were unsuccessful. 1986 to 1991 average <i>ad valorem</i> tariff on imports fell from 115 per cent to 35 per cent. In 1992, the tariff band was reduced to 0-20 per cent.
Brazil:	In 1990, trade liberalisation began with lifting of import restrictions on 1,800 goods. The average tariff came down from 20 per cent to 17.1 per cent by 1992 and was further reduced to 14.1 per cent in July 1993.
Chile:	Reforms began in 1973; QRs eliminated by 1979 and uniform tariff rate of 10 per cent, this rose to 35 per cent during 1982-83 crisis but was then reduced to 15 per cent.
Colombia:	Starting in 1983, import quotas were converted into tariffs contributing to one-third of revenue increase from taxes till 1987. Average tariffs were 20.9 per cent in 1979, fell to 18.7 per cent in 1984 and rose to 29 per cent in 1989; by August 1991, average tariff fell to 15 per cent.
Ghana:	Reforms began in 1982; between 1983 and 1986 currency was devalued 32-fold then by a further 66 per cent in 1987 and a further 43 per cent in 1989. Average tariffs have fallen from 39.7 per cent in 1982 to 6.3 per cent in 1989. In January of 1989, import licensing was abolished. Tariffs remain very low in Ghana.
India:	Major reform of trade regime in 1991. Import control through licensing has more or less been abolished. A continuous process of tariff reductions since July 1991. The peak rate of import tariff has fallen from 150 per cent to 65 per cent between 1991 and 1994.
Indonesia:	Reforms began in 1983; Average tariff rate fell from 17.8 per cent to 13.4 per cent between 1983 and 1989. 1983 currency was devalued by 28 per cent after which real effective exchange rate was kept stable till 1986, when there was a further devaluation of 31 per cent, between 1986 and 1992, proportion of domestic goods protected by import licensing fell from 43 per cent to 13 per cent while average nominal protection has halved.
Ivory Coast:	Structural adjustment programme launched at the end of 1981. The next phase of reform began (1984-86) saw tariff conversion followed by an increase in average tariff rate from 23.5 per cent to 26.6 per cent over 1984-88. 1989 saw a major stabilisation programme.
Mexico:	Trade liberalisation in two phases, 1985 to 1987 saw tariff conversion and reduction in import licensing coverage from 92 per cent to 25 per cent; 1987 onwards emphasis on tariff reduction (average fell from 8.2 per cent in 1987 to 5.4 per cent in 1989). NAFTA envisages phased elimination of tariffs.
Peru:	Stabilisation programme commenced in August 1990 and included substantial trade reform. All QRs were eliminated and the tariff system was simplified to include only three rates (10 per cent, 25 per cent and 50 per cent). The top rate was reduced to 25 per cent in March, 1991.
Philippines:	1983 crisis forced the country to embark on a major stabilisation effort. Serious efforts at structural reforms commenced in 1986. Most QRs were removed; 1992 foreign exchange market was fully deregulated, phased reduction announced in import tariffs.
South Korea:	Trade liberalisation was selective (concentrating on capital goods and intermediates) and commenced in 1972. Between 1983 and 1989, the proportion of product classes carrying import restrictions fell from 19.6 per cent to 5.3 per cent.
Tanzania:	Early 1986 simultaneous implementation of stabilisation and adjustment programmes including liberalisation of trade regime and devaluation.
Turkey:	1980 liberalisation began; average tariffs fell from 39.1 per cent in 1979 to 11.1 per cent in 1980; 1984-import surcharges introduced that increased opacity of the system.
Uruguay:	Significant efforts were made between 1973 and 1982; import quotas and licensing were eliminated in 1975 and controls on capital goods imports terminated in 1977; 1982-85 recession was followed by efforts to stabilise and restructure. Broke down in 1988, efforts resumed in 1990 and were relatively more successful.

Sources: Rodrik 1992, and World Bank 1992.

growth theory is a level effect, analogous to the one-time shifting upward in production possibilities, and not a growth effect. Growth rates that are both large and more importantly sustained may not be achieved simply by allocative efficiency gains or level effects.

VI

Three Gap Approach

In order to highlight how inter-linkages among external shocks, internal (especially fiscal) factors, and the structural features of the developing economies can lead to macro-economic imbalance, a three gap model is being used by many economists. The traditional two gap model is extended by adding a third fiscal/financial constraint to the specification. The liberalisation literature postulates that if institutional obstacles are removed, a market economy will attain an equilibrium position by itself. By contrast, the new gaps approach considers that disequilibrium phenomena may or may not persist after barriers to the free working of market forces are taken away. The outcome will depend on whether or not market signals by themselves induce economic actors to close the gaps; however, this will be determined by the structural features of the economy at hand.

The three gap approach is designed explicitly to incorporate the diverse structural characteristics of developing economies. Such details are ignored by the orthodox neoclassical approach since it sets out a universal policy package to be applied irrespective of the country in question. Country studies in Taylor (1993) suggests at least five sets of factors contributing to macro-economic imbalance. Numerical evidence in this regard is presented in Table 3.

The public sector plays an important role in capital formation in almost all the countries in the sample. Furthermore, most of the country studies have shown a strong linkage between public investment and the consequent crowding in of private capital formation. Indeed, public capital formation may be the only vehicle for stimulating investment after a period of adverse shocks. Unless, of course, export growth pulls investment demand up in a cumulative process as was the case in Korea, in any event private capital formation can hardly be seen as an answer.

Also, the public sector in most of the countries is a strong net saver. Of course, there are exceptions, such as Nicaragua, Uganda, Zambia, and Zimbabwe (Table 3). This is largely due to the macro-economic distress in these countries. Savings by the public sector reflects its activity in capital formation as well as the ability of the state

to gather resources. Table 3 indicates that private savings flows are also large. They must be intermediated into capital formation and/or loans to the state to cover the public sector borrowing requirement (PSBR). This process can lurch into imbalance if a fall in the demand for domestic assets squeezes credit to the public sector or for private investment projects.

Table 3 shows negative trade deficit, that is, surpluses for most of the countries. However, with the exception of India, Nicaragua, Sri Lanka, Tanzania, and Uganda. In many cases these reflect foreign shocks suffered in the 1980s. Of course, Latin American countries had to run surpluses to meet foreign interest obligations at the same time as their governments needed fiscal surpluses since they had nationalised foreign debt. Poor primary product exporters in Africa, on the other hand, were hit hard by steady declines in their terms of trade and lagging export volumes [Bajpai 1992].

The dynamic macro-economic behaviour of developing economies is strongly affected by the features mentioned above, especially when they are hit by an external shock. A sudden cut-off of credits or a significant fall in the terms of trade, besides triggering inflation if devaluation is necessary, is likely to cause reductions in both output and investment. The following channels are emphasised by the three gap models: first, the data in Table 3 suggests that by limiting imports, scarce foreign exchange either squeezes current production or capital formation. This is so because local commodity production requires imported intermediates while foreign made capital goods are an essential

component in most investment projects.

Secondly, since capital inflows are a source of savings, they are to be replaced domestically if their flow is curtailed. The required reduction in aggregate demand, however, is often realised through an acceleration in inflation. Finally, fewer funds will be flowing through the financial system, reducing the supply of credit and therefore capital formation. Since international capital markets are imperfect, the economy tends to adjust to reduced point in time availability of foreign exchange via output reductions mediated by faster inflation and domestic credit rationing.

VII

Concluding Remarks

An attempt is made in this paper to highlight the inadequacies of the traditional rules-of-thumb approach toward economic reforms in developing countries. The underlying model does not seem to address the complexities of economic structures in the developing economies and hence holds good only under very restrictive assumptions. However, despite these fundamental weaknesses the standard rules have enjoyed widespread use and acceptance.

Any move toward dramatic liberalisation needs to be preceded by a successful stabilisation programme. A structural reform programme accompanying stabilisation measures may neither help achieve macro stability nor the restoration of sustainable growth. Of course, any major adjustment or stabilisation programme has always to keep in mind a very important boundary condition,

TABLE 3. DEVELOPING COUNTRY TRADE, INVESTMENT AND SAVINGS FLOWS ...

Country and Year	Intermediate Imports	Investment (Percentage of GDP)				Savings		Trade Deficit
		Foreign Capital Goods	Domestic Capital Goods	Public Sector	Private Sector	Public Sector	Private Sector	
Argentina (1988)	6.0	1.8	12.6	7.6	6.8	0.8	15.6	-2.0
Brazil (1987)	3.8	2.1	17.9	6.2	13.8	6.2	18.3	-4.5

that is, the capacity of the state, both with regard to its political and administrative limitations. The state will ultimately have to play a crucial role in the success of any structural adjustment programme. The fiscal, foreign, and savings gaps are closely linked. Improvement in the first is not likely without gains for the other two as well. Indeed, external support may well be required on all the three fronts. However, the currently pursued adjustment strategy does not take into account the diverse structural characteristics of developing countries which the three gap approach does.

The currently pursued adjustment strategy lacks theoretical support, and moreover empirical evidence from Latin America, Africa, and more recently from Eastern Europe and Russia suggests that different economies with different institutional relationship and varying lines of causality in their economic systems require different approaches to stabilisation and structural reform.

There are examples of successes and failure of both orthodox and heterodox policy initiatives. The problem at hand is how to invent and sequence policy changes relevant for each economy's historical and institutional context. Be that as it may, factors, such as the structure of the existing capital stock, the size of the population, and natural resource endowments put somewhat flexible boundary conditions on policies aimed at raising productive efficiency, but a general solution is nowhere at hand.

Rs. 225/-

ABOUT THE BOOK

The book is a collection of articles on the New Economic Policy and its impact on vulnerable sections. The articles debate on the rationale and the imperative to change the economic policies and how the vulnerable sections are likely to be affected by accelerated growth as well as expected changes in the composition of growth. The articles explore the rationale for public interventions in favour of vulnerable sections, the strategy to be adopted and the design of such programmes, particularly how basic education and health services could be made more cost effective and more target oriented.

Disempowerment of Indian Bureaucracy

A Class Analysis

S K Das

A bureaucracy becomes autonomous and exercises power when the process of class formation is weak or when no class is dominant in a society. Once a class becomes dominant, the autonomy of the bureaucracy ceases to exist and it becomes an instrument in the hands of the dominant class. In India, the growth of classes was stunted during the Moghul and British rule; in the post-colonial situation, no class was dominant. Since the Indian bourgeoisie is now in the process of establishing its dominance, Indian bureaucracy will soon lose its autonomy and power.

IT is commonly believed that with the dissolution of the 'licence-permit raj', the process of disempowerment of the Indian bureaucracy has finally begun. From the right, such a process is seen as the result of a situation in which the bureaucracy has been overtly regulatory and intrusive, and has steadfastly supplanted market forces and individual initiative. The left has viewed such a process as having been brought upon itself by a bureaucracy that is uncaring, unjust and inattentive to the needs of the economically disadvantaged. Those in the middle have attributed this process to the working of a bureaucracy that has been wasteful of public money, slothful, inefficient, inconsiderate of the general public and monumentally corrupt.

Such analyses, albeit well-founded as the woes experienced by the public would testify, remain inadequate, as they are mere critiques of the bureaucracy *qua* bureaucracy. They neither fully problematise the process in the specificity of the Indian situation, nor do they locate it in the complexities of the relationships among class, bureaucracy and state power; this is what this article attempts to do.

THEORETICAL FRAMEWORK

In recent years, there has been considerable discussion of the state as an object of theoretical and empirical enquiry, both in the writings of contemporary Marxists and non-Marxists, but an explicit focus on the working of the bureaucracy has been significantly absent. Some interesting work on the functioning of bureaucracy has been done by Goran Therborn,¹ Claus Offe,² and Erik Olin Wright,³ but such work has tended to concentrate on the bureaucratic structures in advanced capitalist societies. Therefore, the writings of Max Weber, Marx and Engels still provide the crucial points of reference for any meaningful discussion of class, bureaucracy and state power.⁴

About bureaucracies, Weber says,

The decisive reason for the advance of bureaucratic organisation has always been its purely technical superiority over any other form of organisation. The fully

developed bureaucratic apparatus compares with other organisations exactly as does the machine with the non-mechanical modes of production. Precision, speed, unambiguity, knowledge of the files, continuity, discretion, unity, strict subordination, reduction of friction and of material and personal costs – these are raised to the optimum point in the strictly bureaucratic administration and especially in its monocratic form.⁵

About the overwhelming power that the bureaucracy exercises, Weber writes,

Under normal conditions, the power position of a fully developed bureaucracy is always overpowering. The political master always finds himself in the position of a dilettante who stands opposite the expert.⁶

Can the bureaucracy ever be dismantled? Weber's answer is in the negative. He says,

Once it is fully established, bureaucracy is among those social structures which are the hardest to destroy... And where the bureaucratisation of administration has been completely carried through, a form of power relation is established that is practically unshatterable. The ruled, for their part, cannot dispense with or replace the bureaucratic apparatus of authority once it exists.⁷

Since bureaucracy cannot be eliminated, the problem, according to Weber, was how to check bureaucratic power and to provide guarantees that would prevent bureaucrats from overstepping their proper place. Writing about Germany, Weber advocated a strong working parliament that alone could control the bureaucracy.⁸

Weberian insights into the nature and working of bureaucracies, profound and seminal though they were, are not particularly useful for the purposes of our analysis because of the following reasons. First, for Weber bureaucratic power is not derived from the economic hegemony of the class that founds the state but from the need for rational and predictable administration. Thus class and power in the Weberian paradigm are related only in a contingent manner. Such a formulation misses the very crucial relationship between bureaucracy and class power; in Weber, there is no assumption of

shared interest between the bureaucracy and the dominant class.⁹ Second, the only scenario in which Weber contemplates erosion of bureaucratic power – the creation of a strong, working parliament – is not realistic as it does not take note of the important relationship of parliamentary institutions to class power. While it may be true that a strong, working parliament may circumscribe bureaucratic power to some extent, it is debatable whether a strong parliament is at all possible given the contradictions of a capitalist society. Weber himself was not overtly optimistic about the long-term durability of parliaments, but his pessimism had more to do with the organisational problems faced by a parliament when dealing with a powerful bureaucracy. Weber never tried to situate the question of efficacy of parliamentary institutions in the context of the social contradictions of capitalist society.¹⁰

Marx's observations about the bureaucracy came out of his critique of Hegel, particularly Hegel's observations in *Philosophy of Right*.¹¹ In that book, Hegel contended that the most important institution in the state was the bureaucracy which represented "the absolutely universal interests of the state proper", the particular interests having been mitigated by hierarchy, specialisation, expertise, co-ordination and the internal and external pressures for competence and impartiality. Marx, on the other hand, argued that the bureaucracy, far from representing the universal interest as characterised by Hegel, only transformed universal interests into private interests. As Marx writes,

The bureaucracy asserts itself to be the final end of the state. Because bureaucracy makes its formal aims its content, it comes into conflict everywhere with the real aims. Hence it is obliged to present what is formal for the content and the content for what is formal. The aims of the state are transformed into aims of bureaus, or the aims of the bureaus into aims of the state. The bureaucracy is a circle from which nobody can escape. Its hierarchy is a hierarchy of knowledge. The highest point entrusts the understanding of the particulars to lower echelons, whereas these, on the other hand, credit the highest

with an understanding in regard to the universal (the general interest); and thus they deceive one another.¹²

Marx argues that so long as private and public spheres are conceptualised as distinct and opposed to each other, the bureaucracy would claim to represent the general interest of the community. As a matter of fact, such distinction and opposition provides the legitimisation on the basis of which the bureaucracy justifies its power. Marx contends that such a dualism between the spheres of private and public interest does not exist. The claim of the state and its bureaucracy to represent the general interest is negated by the existence of classes. Marx therefore argues that the independence of the state from the dominant class is illusory; it is the ownership of property that determines political power. As Marx put it definitively in *The Communist Manifesto*,¹³ "the executive of the modern state is but a committee for managing the common affairs of the whole bourgeoisie." The state and its bureaucracy are instruments of the dominant class, such an instrumentalist perception of the state by Marx was further expanded and refined by Lenin,¹⁴ Paul Sweezy,¹⁵ and Ralph Miliband.¹⁶

The other interpretation of Marx's account of the relation among classes, the bourgeoisie and the state, particularly the characterisation of the Bonapartist state, emerges out of a reading of *The Eighteenth Brumaire of Louis Bonaparte*.¹⁷ This was taken up further by Louis Althusser¹⁸ and Nicos Poulantzas.¹⁹ Poulantzas' formulation is based on the Althusserian interpretation of Marx that posits a relative separation between the economic and political instances of the capitalist mode of production.

Althusser argues that the Marxist social whole is constituted by a certain type of complexity, the unity of the structured whole containing levels or instances which are distinct relatively autonomous, and which co-exist within this complex structural unity, articulated with one another according to specific determinations, fixed in the last instance by the level or instance of the economy. Poulantzas borrows the concept of relative autonomy from Althusser and enlarges it to conceptualise the autonomy of the state apparatus from the dominant class in a capitalist society. Poulantzas argues that the capitalist state functions to maintain the cohesion and unity of the social formation, but carries out this function specifically by containing class struggle by way of organising the dominant class and disorganising the dominated classes. This is done by cleverly presenting the state as the unity of the people-nation, both by concealing the class character of the state apparatus from the dominated classes and by specifically excluding them from state institutions. This is possible only because

the state apparatus is relatively autonomous from the economic instance.²⁰ Poulantzas argues that the capitalist class is not a homogeneous class; it consists of several fractions whose interests are not always identical. The state can serve the ruling class only when it is relatively autonomous from the diverse fractions of the capitalist class precisely in order to organise the hegemony of the whole of this class.

Such a conception of the relative autonomy of the state apparatus has been used in a wider perspective to mean that the state generally, and the bureaucracy in particular, emerge as a distinct sphere in society, may take a variety of forms, and constitute a source of power which need not be linked to the interests, or be under the control, of the capitalist class.²¹ The concept of relative autonomy, however, may not apply to social formations where the autonomy of the state does not necessarily result in the hegemony of the dominant class, as has been shown by Thomas Banat in his study of Peru and Brazil,²² and Anupam Sen in his study of India.²³ In fact, as Hamza Alavi writes with reference to the state in Pakistan and Bangladesh,

Such a proposition (*relative autonomy*) cannot apply to a discussion of post-colonial societies in which the problem arises not with reference to 'diverse fractions' of a single class, the bourgeoisie, but rather with reference to three different propertied classes, which do not constitute 'a whole', for they have different structural bases and competing class interests²⁴ (emphasis added).

There is, however, a third strand in the writings of Marx and Engels which suggests that the bureaucracy could become independent when classes in the social formation have stunted growth or when no class emerges as the dominant class. In such scenarios, the bureaucracy becomes the ruling class.²⁵ As Marx says,

The independence of the state is only found nowadays in those countries where the estates have not yet completely developed into classes, where estates, done away with in more advanced countries, still have a part to play, and where there exists a mixture, countries, that is to say, in which no one section of the population can achieve dominance over the other.²⁶

In fact, this strand of Marx's position is continued by Engels when he comments on the situation in Germany:

Bureaucracy... very soon becomes an unbearable fetter for the bourgeoisie... And the more the industry develops, the more 'conscientious officials' appear – that is, officials who either from pure narrow-mindedness or from the bureaucratic hatred of the bourgeoisie, pester the factory owners with the most infuriating chicaneries. The bourgeoisie, therefore, is compelled to break the power of the indolent and pettifogging

bureaucracy. From the moment the state administration and legislature fall under the control of the bourgeoisie, the independence of the bureaucracy ceases to exist, indeed from this moment, the tormentors of the bourgeoisie turn into their humble slaves.²⁷

The discussion so far suggests a theoretical framework for our analysis, follows. The bureaucracy is independent and exercises power when classes in the social formation have stunted growth or when no class emerges as the dominant class in a social formation. In such situations, the bureaucracy becomes the ruling class. However, once a class becomes dominant over other classes in a social formation, the independence of the bureaucracy ceases to exist and it becomes an instrument in the hands of the dominant class.

INDIAN SITUATION

In India, the process of class formation has been very different from that in Europe. In the European case, capitalism grew out of feudalism; the development of merchant capitalism and industrial capitalism was made possible by the operation of internal economic forces.²⁸ For instance, under feudalism excessive exploitation of peasants and serfs by feudal lords in quest of larger rents to meet their increasing demand for luxuries, the association of merchant capital with land purchase deals, and the resultant commercialisation of agriculture, gave rise to a situation in which labour was rendered surplus and a large segment of the peasantry was eventually transformed into landless wage-labourers.²⁹ As Marx says,

The prelude to the revolution that laid the foundation of the capitalist mode of production was played out in the last third of the fifteenth century and the first few decades of the sixteenth. A mass of 'free' and unattached proletarians was hurled into the labour-market... the great feudal lords, in their defiant opposition to the king and the Parliament, created an incomparably larger proletariat by forcibly driving the peasantry from the land, to which the latter had the same feudal title as the lords themselves, and by the usurpation of the common lands.³⁰

The important point to be noted here is that the relation of production – the feudal lords owned the lands and the serfs as well – was central to the process of separation of the producers from the land and to the creation of the necessary antagonism between the feudal lords and the peasantry.

More important, the absolutism in politics that dominated the European scene in the 17th century was, in fact, a crucial determinant in the process of merchant capital establishing its control over the state apparatus. Absolutism in politics was made

possible in Europe primarily because the bourgeoisie aligned itself with the king. Such absolutism was instrumental in circumscribing the power and influence of the feudal lords; in addition, the absolutism of the state was used very effectively to eliminate all possible fetters on the growth and development of capitalism. Eventually the successful bourgeois revolution against the state brought about the end of absolutism in politics and enabled the capitalist class to found its own state.¹¹

In India, class formation was stunted from the very beginning. In fact, the process of class formation, as it developed, was unlike the progression of stages as in Europe. In India, the dissolution of the primitive society or clan organisation did not give rise to a slave system or feudalism. Instead, there was what Marx described as the Asiatic mode of production with the Oriental despotic state as its principal characteristic. In this mode, the zamindars or the jagirdars could not emerge as an independent class, as the feudal lords did in Europe, because of the fact that the zamindars and jagirdars were not the owners of the land on which they collected revenue. This was also the reason why capitalism was unable to evolve smoothly and naturally out of the Asiatic mode, the precondition for the emergence of capitalism, namely, wage labour, was significantly absent. Since the zamindars and jagirdars did not own the land, they were not in a position to separate the workers from the land as in Europe.¹²

However, the Asiatic mode of production was not as irretrievably stagnant and immobile as Marx would have us believe. In the 17th and 18th centuries when trade was opened up with the West, a merchant class that was prosperous and had the capacity to achieve dominance in the social formation, came into existence. But with the industrial revolution in England, India was made into an importer of manufactured commodities instead of being an exporter; that was the end of the rising merchant capitalist class.¹³ Ultimately, an indigenous capitalist class did emerge in colonial India, but in the scheme of things, it could only be a comprador class, thoroughly subservient to the metropolitan bourgeoisie that controlled the state apparatus.¹⁴ Such a comprador bourgeoisie that was a mere agent of the metropolitan bourgeoisie could never become the dominant class.

At the time of independence, post-colonial Indian society had three classes, but none of them were dominant. The Indian capitalist class, congenitally weak because of its comprador status, was in no position to achieve dominance. The metropolitan bourgeoisie was no longer dominant, because in the post-colonial era it did not control the state apparatus any-

more. There was, of course, the landed class, but it did not enjoy dominance. Thus, in the history of the Indian social formation, either the process of class formation was stunted, or when classes did eventually emerge, none of them was in a position to achieve dominance over the other classes.

In such a situation, the Indian bureaucracy was autonomous and exercised power both during the Moghul and the British rule, because the growth of classes was stunted.¹⁵ At the time of independence and after, the bureaucracy was autonomous because no single class was able to establish its dominance over other classes. What Hamza Alavi said of post-colonial societies in Pakistan and Bangladesh, applied equally to the Indian situation:

The essential problem about the state in post-colonial societies stems from the fact that it is not established by an ascendant native bourgeoisie but instead by a foreign imperialist bourgeoisie. At independence, however, the direct command of the latter over the colonial state is ended. But, by the same token, its influence over it is by no means brought to an end. The metropolitan bourgeoisie, joined by other neo-colonialist bourgeoisies, is present in the post-colonial society—the state in the post-colonial society is not the instrument of a single class. It is relatively autonomous and it mediates between the competing interests of the three propertied classes, namely, the metropolitan bourgeoisie, the indigenous bourgeoisie and the landed classes, while at the same time acting on behalf of them all to preserve the social order in which their interests are embedded, namely, the institution of private property and the capitalist mode as the dominant mode of production.¹⁶

In the post-colonial situation, the Indian bureaucracy also assumed an autonomous economic role euphemistically, to promote egalitarianism, to influence income distribution and to alleviate poverty. In fact, the bureaucracy appropriated a substantial part of the economic surplus and deployed it in bureaucratically directed economic activities ostensibly to promote economic development; in the process, it arrogated to itself the commanding heights of the economy to the exclusion of the Indian bourgeoisie. The output, of course, was woefully inadequate; there was a steady worsening of overall economic conditions for the poor juxtaposed with uncontrolled consumptionism for the rich and the burgeoning middle class. The inevitable happened—there was a serious depletion of foreign exchange resources and the state was driven, out of sheer necessity for consumption even on a quotidian basis, to seek financial assistance from international funding agencies.

The international funding agencies have,

of course, agreed to dole out largesse, but have made it contingent on the implementation of a programme for dismantling the bureaucratic stranglehold, the programme to be supervised by their resident representatives in India. More importantly, the agencies have insisted upon anointing the Indian bourgeoisie as the favoured agency for the country's development, and in the process have mounted an ideological offensive against any form of bureaucratically induced statism that in their minds, constitutes imperfections in hegemonising the bourgeoisie. This effectively creates the necessary conditions for the Indian bourgeoisie to establish its dominance in the social formation. Considering the emerging close linkages between these agencies and India, and given the performance of these agencies in managing economic development and guiding class formation in much of the third world,¹⁷ coupled with their institutional capability to do so, it is only a matter of time before the Indian bourgeoisie actually establishes its dominance in the social formation.¹⁸

There are two factors of contemporary significance that valorise the ongoing process of the Indian bourgeoisie establishing its dominance. First, there has been an overwhelming global consensus that for the economy to reach a higher growth path, the bourgeoisie should be hegemonised; any deviation by way of statism or bureaucratic intrusion would merely detract from this objective.¹⁹ Second, third world countries are vying with one another in welcoming MNC operations to their soil, the MNCs on their part, are attracted by the immense potential of the ever-expanding market outlets in these countries. The MNCs, however, have shown a marked preference for operating through the domestic bourgeoisie so that they could pursue their sole interest of profit-making without being distracted by political risks attendant on direct investment. To enable the domestic bourgeoisie to provide meaningful support in these joint ventures, the MNCs now have a vested interest in ensuring that this class is made dominant in the social formation.

Is this ascendant bourgeoisie a comprador one? If it is, its subordinate status would necessarily detract from its colonising the bureaucracy. It has now become fashionable to attribute the ascendancy of the Indian bourgeoisie to a patron-client relationship; the international funding agencies are viewed as omnipotent patrons that can metamorphose domestic bourgeoisies at will, while the Indian bourgeoisie is seen as a weak, dependent and subordinate client. It would be sheer naivete, however, to see the IMF and the World Bank as demurges, organising

singlehanded the process of hegemonisation of weak domestic bourgeoisies in errant capitalist countries of the third world: they should rather be seen as 'organic intellectuals' in their role in promoting and installing abroad a project for hegemonising the bourgeoisie on a global scale.⁴⁰ As Antonio Gramsci put it, "Every social group creates together with itself, organically, one or more strata of intellectuals which give it homogeneity and an awareness of its own functions not only in the economic but also in the social and political fields. The capitalist entrepreneur creates alongside himself the industrial technician, the specialist in political economy, the organisers of a new culture, of a new legal system, etc."⁴¹ The organic intellectuals provide the political, intellectual and moral leadership through which hegemony is established. With the IMF and the World Bank as organic intellectuals, the hegemony that is sought to be established is that of the bourgeoisie as a class; the project is to expand it economically, politically and ideologically to cover the entire globe.⁴²

The increasing number of joint ventures between the MNCs and the domestic bourgeoisie, with the MNCs taking the initiative, has given rise to an influential critique that also invokes the comprador argument, this critique tends to see the domestic bourgeoisie as weak and dependent vis-a-vis the MNCs. Such a characterisation of the ascendant Indian bourgeoisie as comprador to the transnational bourgeoisie is a mere mindless chanting of the *dependencia* mantra.⁴³ The new relational pattern that joins the Indian bourgeoisie to the transnational bourgeoisie can be more appropriately described as a mutuality; it is neither antagonistic nor comprador. The MNCs value their new-found relationship with the Indian bourgeoisie, because such a relationship gives them access to the Indian market for their merchandise and technologies without subjecting them to the political risks inherent in direct investment, and without their having to navigate the intractable realities of an unfriendly environment. The Indian bourgeoisie, on its part, gets access to technology and entry into the hallowed portals of international business. Thus, the relationship is beneficial to both, the dependence is mutual and equal; the mutuality is between partners, neither unequal nor hierarchical.

The Indian bourgeoisie is now in the process of emerging as the dominant class in the social formation. It will eventually found its own state and colonise the bureaucracy; the Indian bureaucracy will ultimately become an instrument of the Indian bourgeoisie. Such a process is gradual and incremental; even Lenin, perhaps the greatest protagonist of the instrumentalist view, who believed that a

socialist revolution would instantly demolish bureaucratic structures,⁴⁴ found to his disgust that bureaucracy can be subordinated only over a period of time. Addressing the Eighth Party Congress in 1919, Lenin said, "We have been hearing complaints about bureaucracy for a long time, the complaints are undoubtedly well-founded... Here we are suffering from the fact that Russia was not sufficiently developed as a capitalist country. Germany, apparently, will suffer less from this because her bureaucratic apparatus passed through an extensive school, which sucks people dry but compels them to work and not just wear out armchairs as happens in our offices."⁴⁵ Now that the Indian bourgeoisie is in the process of being dominant, the autonomy and power of the Indian bureaucracy will gradually wither away; the dissolution of the licence-permit raj was, perhaps, the beginning of the end.

TFRP in Manufacturing Industry

D U Sastry

THIS is a brief note with reference to the paper by P Balakrishna and K Pushpangadan (*EPW*, July 30, 1994) and the reaction to it by Isher Judge Ahluwalia (*EPW*, October 22, 1994).

The point raised by Isher Ahluwalia is whether double deflation is better than single deflation and whether reliable price indices for raw materials are available to deflate raw materials. On the first point Isher Ahluwalia agrees that double deflation procedure is better than single deflation. On the second point, she says she did not do double deflation as she did not find reliable data.

Ahluwalia observes that raw material prices have been rising faster than output prices in Indian industry during the 1970s and 1980s. In such a situation, will not single deflation method result in understating value added? This has obvious consequences for productivity growth. And therefore it is both necessary and desirable to go in for double deflation procedure in obtaining a real measure of output.

The second point is about non-availability of reliable data on price indices for raw materials. The wholesale price index numbers put out regularly by the office of the economic adviser, ministry of industry, government of India, report data on raw material prices as well as fuel prices both for the aggregate as well as for individual items within the group. From these it is possible to construct a weighted index for each individual industry. For instance, the price index for electricity, limestone and coal could be combined with relative weights and this index could be used for deflating raw materials consumed in cement industry. Similarly, for other industries, raw material price index can be constructed with more recent base 1981-82=100.

It is also possible to construct price index of raw materials for each industry from the Annual Survey of Industry volumes. ASI volumes present detailed data under the head Basic Raw Materials Consumed, on raw material inputs both in quantity and value terms. The only item for which only value figures are reported is the item 'Others' which is a negligible fraction of the total raw materials consumed. The construction of such an index for each industry is undoubtedly an enormous task both in terms of time and effort.

Isher Ahluwalia points out that raw material price deflator with 1973-74 weights derived from 1973-74 input-output table by Balakrishna and Pushpangadan is not quite

appropriate as it does not capture structural changes in the 1970s and 1980s. The point is valid. But Laspeyres Index with fixed weights, no matter what base you consider, cannot accommodate structural changes. This is the limitation of the Laspeyres Index. Structural change is a continuing phenomena because prices are changing, new commodities are emerging and technology is changing. This is especially so in the Indian context due to planning and more recently due to changing policy environment. Once this is recognised, the alternative open is to construct a chain index which incorporates such structural change. The effort involved in the construction of such a chain index is even more demanding in terms of data and time.

For these reasons most scholars resort to single deflation procedure. I myself have done this in my studies. More often than not, the point does not strike one until someone points it out. The argument that reliable data does not exist is simply not true. It is also important to remember that all deflation procedures, whether single or double, are at

best approximations, no matter how much meticulous care you take.

Two other points require special mention. There are a number of reasons to believe that ASI output data are somewhat understated. First, output is ex-factory net of taxes and duties. The scope for tax evasion exists due to seepage in output. How much of it escapes the tax net is anybody's guess. Second, while output is ex-factory, raw materials consumed are inclusive of taxes and duties. This would imply under-valuation of value added. Third, wholesale price index numbers used for deflation of output/value added include taxes and duties, while output is ex-factory. This also affects value added.

The second point relates to ASI coverage. ASI covers only the organised manufacturing sector. The small sector which produces about one-third of industry output is outside the scope of ASI. Inferences drawn using ASI data should at least qualify explicitly their limitation. Unfortunately, recent studies on productivity have generally overlooked this factor.

It is easy to brush aside comments. A smart reply is not always a correct reply. Scientific progress comes through intense debate, dissent and an open mind to understanding others. There is much to learn from one another.

Calculating the Fiscal Deficit

I S Gulati

BOTH M Subbarao (*EPW*, August 27, 1994) and R J Mody (*EPW*, September 17, 1994) have offered very insightful comments on my note (*EPW*, May 21, 1994) on calculating the fiscal deficit. Subbarao takes the view that given the way the government has chosen to define the fiscal deficit, namely, as: [Total expenditure (revenue and capital)] minus [Total revenue receipts + non-debt creating capital receipts], there is little room for ambiguity as "the formula provides automatically for netting out recoveries of past loans from fresh loans advanced during the year, just as it provides for netting out disinvestment proceeds from fresh investment in public enterprises". Not only is there no ambiguity about the treatment of public sector disinvestment proceeds, according to Subbarao, but also there is "nothing particularly wrong in taking credit for these proceeds in determining the fiscal deficit as long as the fiscal deficit itself is used with the caution that it warrants".

The concern addressed in my note, I may clarify, was not with regard to the departure

made by government from standard usage in defining the fiscal deficit for its purposes, but with the questions and doubts the definition thus adopted raised, particularly with respect to the treatment of the proceeds from public sector disinvestment. It will be useful to recall in this context that no objection was raised to the government definition on grounds of ambiguity. What my note was really trying to examine was the extent to which the doubts raised by critics with respect to netting the fiscal deficit for public sector disinvestment proceeds were valid and came to the conclusion that

...from the point of consistency, if recoveries of loans are allowed to be set off against total government expenditure, there should not be any objection to treating sales realisations of public sector equity similarly.

Having said that, my note went on to raise a question about the implications, for purposes of policy analysis, of netting the fiscal deficit for certain types of capital receipts, which the government described as non-debt creating. The net amount realised

from these non-debt creating receipts, it was argued in my note,

would legitimately be considered in the nature of government receipt that should be taken to raise and not reduce the fiscal deficit because such receipt itself takes on the nature of borrowing in the sense that the amount thus received, like other amounts the government borrows, goes towards the financing of current government expenditure

The point being made here is not so much about whether the so-called fiscal deficit is higher as a consequence but about the nature of government receipts that finance its expenditure. Basically, I believe, from the point of view of macro-economic management, it is how government expenditure is financed that is important. When Subbarao refers to the 'critical importance' of the method of financing the fiscal deficit because "it influences the macro-economy in ways more diverse than can be captured by its aggregate value or the terms of its financing" or when Mody refers to the objectives of stabilisation, I think our concerns are very much the same

I am attracted to Mody's suggestion that the fiscal deficit be defined in terms of the net increase in the government's financial liability rather than in the way the government has chosen to define it – not so much because it accommodates my "argument for treating both the terms (i.e., recoveries of loans and public sector disinvestment) in the same manner" as because, as Mody ably demonstrates, it is a concept relevant "if economic stabilisation is the goal of fiscal policy". In the current Indian context, however, I too like Mody, feel that "the good old concept" of deficit finance in the sense of budget deficit is "more relevant" and "quite sound as compared to the newly imported concept" of fiscal deficit

Also, I fully agree with Mody when he observes that we need not take a particular definition of deficit as sacrosanct. A concept has to be useful for the purpose it is meant to subserve. Mody and I are evidently agreed on the usefulness of the budget deficit as a concept in the formulation and implementation of macro-economic stabilisation policy

One should instead see the phenomenon in terms of social transition. A situation where specific forms of feudalism have been destroyed without agrarian surplus acquiring a dynamic of self-reproduction and thereby overthrowing or subsuming all pre-capitalist relations that bind the tiller to the soil. What we see in the green revolution areas can hardly be described as large-scale profit-maximising farmers at one end and formally free agricultural proletariat at the other end of the scale, so to speak.

What characterises Indian agriculture instead is a welter of production relations with the common thread of various degrees of unfree labour by marginalised and landless peasantry. For, even in the green revolution areas of Andhra Pradesh, formal cash payment is not wages in return for definite labour time but payment in return for unspecified services and labour time. This is often compounded by usury and bondage of varying intensity depending upon the peculiarities of local custom and alternative sources of livelihood to the producer. To see a class of 'capitalist landlords' in this is to fall victim to the vulgarised and mechanistic understanding of academics who see in Indian agriculture 'patches of capitalism' surrounding a vast hinterland of feudalism.

Extrapolating from this and describing NTR's campaign as anti-feudal rhetoric amounts to imposing a priori concepts on reality. In fact, NTR's rhetoric is thoroughly feudal. Witness his emotive appeal to the pride of his 'Telugu kin' with himself as their benign patriarch, the invoking of the battles of Palanadu in Guntur or Bobbili in Vizianagaram districts or his much-publicised subsidised rice scheme as a personal largesse to his 'Telugu' constituency

As for the abolition of the village officer system, one can justifiably ask whether purely administrative reforms would in themselves constitute abolition of a certain mode of production. Surely, the author with his sense of history, is aware of the administrative reforms undertaken by the Nizam's state under the administration of Salar Jung or Aravamudan Ayyangar, or of the reality of the Telengana armed struggle being the strongest in the Warangal and Nalgonda subhas which were ryotwari areas.

What NTR has performed is a purely administrative reform striking at the base of the Congress Party's structure of support and patronage systematically built up over the decades and broadening the base of the state by incorporating new sections of landed/propertied classes

That the emergence of these new sections and their articulate representatives in civil society has led to a social ferment in Andhra society is a heartening fact, but ultimately class is as class does.

Caste and Politics in Andhra Pradesh

K Narendra Mohan

K SRINIVASULU's article 'BSP and Caste Politics' (EPW, October 1, 1994) occupies an uneasy middle ground between Marxism and the politics of identity and will in all likelihood be sniped at from both sides. While it would seem the wisdom of hindsight to comment upon the performance of the Bahujan Samaj Party in the assembly election in November-December 1994, one cannot leave unexamined the questions raised in the article both about our understanding of the mode of production and the possible identification of certain castes with a particular mode of production – in the present case, the supposed confrontation of the 'feudal' reddy of Telengana by the 'capitalist' kammis of coastal Andhra.

Karamchedu is not a tobacco-growing (and at the same time a green revolution) village, but a canal-irrigated and predominantly paddy-growing coastal Andhra village. Tobacco cultivation in coastal Andhra is nearly a century old and far predates the green revolution.

Coming to more debatable questions, one cannot leave unchallenged the theoretical assumption behind the observation "if one were to imagine them [caste riots] to be symptomatic of pre-capitalist social relations (for, in the received paradigm of understanding, caste riots are taken to be characteristic of a backward

feudal social milieu like Bihar), it must be pointed out that these riots, pre-planned and meticulously executed had occurred in the advanced green revolution areas of coastal Andhra". Or what is stated in as many words in a later paragraph: "The rich peasant and 'capitalist landlord' class-caste that emerged in the fertile coastal Andhra region over a period of time and crystallised into a *nouveau riche* stratum with multiple economic interests in cinema production and distribution, agro-industry and the tertiary sector (in social terms predominantly belonging to the kamma caste) but denied access to the corridors of power during the three decades of Congress rule found in NTR a general who could rally the masses in the electoral battlefield and further the political interests of this class."

Implicit here is the conception of agrarian capitalism in terms of the tractor-tubewell-HYV-canal irrigation paradigm that has informed much of the mode of production debate and which is put forth with unfailing regularity by the peasant organisations of the CPI and CPI(M). To see green revolution areas, with their relatively more developed productive forces, infrastructure and output for a market of sorts, as representing capitalism in agriculture, is a perversion of the CPI(ML) position on semi-feudalism.

A savings scheme that
MORE THAN DOUBLES
your money in just
SIX YEARS

• Tax rebate u/s 88 on investment.

• 12% tax-free interest u/s 80 L.

• Rs. 1000/- become Rs. 2015/- on maturity.

• Tax rebate on accrued interest up to 5 years.

• Nomination facility available.

SIX YEARS
NATIONAL SAVINGS CERTIFICATES
8th ISSUE

DIRECTORATE OF SMALL SAVINGS, GOVERNMENT OF MAHARASHTRA

For your precious little girl.

Raj Lakshmi

UNIT PLAN
For her better tomorrow

FEATURES:

- An open-ended Plan
- Minimum investment of Rs 1500 and in multiples of Rs 500 thereafter. No upper limit
- Any individual, state govt., central govt., trust, society, corporate body can invest for a girl child up to 5 years of age
- Investment of Rs 1500 made at birth of child may become Rs 21,000 in 20 years. Quantum of growth depends on age at entry
- Date of maturity will be calculated from the date of acceptance of the application
- Bonus dividend, if declared periodically, will be payable on maturity.

UNIT TRUST OF INDIA

All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of future results. Raj Lakshmi is only the name of the scheme and does not in any manner indicate either the quality of the scheme, its future prospects or returns. There can be no assurance that the plans objectives will be achieved. Please read the offer document before investing.

Corporate Office: Vikas Centre, 106, S. V. Road, Santacruz (W) Bombay 400 054 Tel: 6100176/77 Fax: 6100179

TWO SIMULTANEOUS BUT UNLINKED PUBLIC ISSUES OF 7,87,60,000 EQUITY SHARES OF RS. 10/- EACH FOR CASH AT PAR AGGREGATING RS. 78,76,00,000
37,00,000 13.5% SECURED REDEEMABLE PARTLY CONVERTIBLE DEBENTURES OF RS. 250/- EACH FOR CASH AT PAR AGGREGATING RS. 92,50,00,000.

HIGHLIGHTS OF THE ISSUES

1. Project to set up 2 million tonnes per annum cement plant in Satna district of Madhya Pradesh
2. Company promoted by Mr. Rajan Raheja (a real estate developer having interests in several industries) Hathway Investments Pvt. Ltd., F. L. Smidth & Co. A/S, Denmark (FLS) and the Industrialisation Fund for Developing Countries, Denmark. Technology and core machines from internationally well known and renowned FLS Group together with performance guarantees and on-going technical support.
3. International Finance Corporation, Washington has sanctioned a Term Loan of U.S. \$30 million (approx. Rs. 94.5 crores) and participation in Equity of Rs. 15.75 crores. The Industrial Credit and Investment Corporation of India Ltd. has sanctioned a Term Loan of Rs. 80 crores and Underwriting of Rs. 20 crores.
4. The Company has made arrangements for buy back of Non-Convertible portion of debentures (KHOKHA) with Unit Trust of India (UTI) and Housing Development Finance Corporation (HDFC). The cost of the Equity Shares to allottees who opt for this facility would be Rs. 12.20 per share.
5. Easy Liquidity: Listing at the Ahmedabad, Bombay, Delhi and Hyderabad Stock Exchanges.

RISK FACTORS

A Internal to the Company

1. The project is capital intensive and any delay in implementation of the project resulting into overrun would adversely affect the cost of the project. However, as on date, the Company does not foresee any delay in the implementation of the project.
2. The Company has spent about Rs. 32 crores on the project as on December 10, 1994 and as such, the project is in the early stages of implementation.
3. The Company has yet to tie up working capital requirements with banks.

B External to the Company

1. The profitability of the Company will be affected by any change in Government policy in respect of excise duty rates, administered prices for raw materials and in case of foreign currency loans to the extent of exchange rate variations.
2. Demand for cement and its price realisation is influenced, amongst others, by excise duty on cement and economic growth of the country. Any adverse changes in these may affect the Company's profitability.

3. The project envisages borrowings in foreign exchange to the extent of US\$ 30m i.e. Rs. 94.5 crores approximately. Any adverse exchange rate variation will have a bearing on the entire cost of the project and profitability.

4. Investors may note that listing on the stock exchanges does not necessarily ensure liquidity.

MANAGEMENT'S PERCEPTION OF RISK FACTORS

- A.1 The project team is well experienced in setting up cement projects in the country. Moreover, a contingency provision of Rs. 59.07 crores in the cost of the project has been made which in the opinion of the management is adequate to meet cost overrun, if any.
- A.2 The Company has already firmed up orders for about 85% of plant and machinery thus reducing the possibilities of cost overrun.
- A.3 The Bankers to the Company have agreed to provide the necessary working capital at an appropriate time.
- B.3 The foreign exchange component comprises about 17% of the project cost. The project cost, therefore, will not be substantially affected by exchange rate fluctuations, if any.

Credit Rating

CRISIL has assigned a rating of "BBB-" (pronounced "Triple B plus") to the issue of the Debentures being offered through the Prospectus. The "BBB-" rating indicates sufficient safety with regard to timely payment of interest and principal, however, changing circumstances are more likely to lead to weakened capacity to pay interest and repay principal than for Debentures in the higher rated categories.

Ceiling on Application

Resident Indian Public may note that an application can be made for a maximum of 15,00,000 shares and/or 2,00,000 Debentures.

If the Company does not receive the minimum subscription of 90% of the issue amount of either Equity Shares or Debentures, including development or underwriters, within 60 days from the date of closure of the issue, the Company shall forthwith refund the entire subscription received in respect of either the Equity Shares or the Debentures as the case may be. For any delay beyond 78 days in refund of subscription, the Company shall pay interest as per Section 3 of the Act.

Terms of allotment will be finalised in consultation with the Regional Stock Exchange at Hyderabad. In the event the issues being oversubscribed more than 100%, the representative of SEBI will also be associated in the allotment process.

Vol XXX No 3

January 21, 1995

Liberalisation and Asset Distribution

Given the presence of a large number of assetless poor in a country as an initial condition, a competitive equilibrium will have a sizeable volume of involuntary unemployment consisting mostly of these very poor people. In other words, liberalisation, which essentially means introduction of market competition, cannot resolve the unemployment problem so long as sharp inequality in asset distribution persists. Having started with radical land reforms, east Asia's situation in this regard was radically different from that of south Asia and Latin America today. 157

Paying for Privatisation

Too often high-level health and development planners get so absorbed in macro issues of health economics that they lose sight of the micro issues. Little research has been done to examine the extent to which the money poor families spend on health care affects their nutritional status and thereby their health and survival, particularly of women and children. Yet these questions are crucial in the context of the west's current assault on health care in the third world in the name of privatisation and cost recovery. 147

Sharing Power

Of India's 'two societies', one is poised to receive marginal benefits from the broadening of the institutional base of power that is being promoted under the two amendments to the Constitution on the subject of decentralisation and elected self-governing local authorities, while the other is left to fend for itself under regional, national and international conditions more hostile than ever before experienced in the country's post-colonial history. 152

Transport and Environment

Urban transportation in India is dominated by road transport. Study of passenger transport by vehicle type and energy intensity in a large city throws interesting light on the relation between transportation and energy consumption and the environmental impact. 161

Mocking 'Populism'

The Telugu Desam Party's cheap rice scheme has undoubtedly attracted the people. The question of fiscal profligacy cannot be divorced from the larger question of how and on what basis the nation's resources are being shared out. Under neither the bureaucrat-politician nexus nor the laws of the capitalist jungle do the weak have any place and so they are bound to seek protective measures from the government on pain of voting it out. Contemptuous attitudes towards 'populism' have to be judged in this light. 136

Irrigation Potential

A large amount of data is now available for completed irrigation projects on annual and seasonal rainfall in the catchment, run-off and discharge, and the volume of water in the reservoir every year, classified by different types of catchment. Redefining the irrigation potential of projects on the basis of these data instead of sticking to old, almost ancient, formulae should engage the attention of irrigation engineers. 176

Farmers and Politics

One of the most surprising outcomes of the Karnataka assembly elections was the dismal performance of the Karnataka Rajya Raitha Sangha, the powerful organisation of farmers. The reason for this lies in the Sangha's very approach to electoral politics. 140

Dalit Literature

While there was no literary genre distinctively known as 'dalit literature' in Telugu in the pre-independence period, the agony and anger of the dalit masses were reflected in the writings of dalit intellectuals. 171

Securing the South

The west now seems to view the south as a threat which needs to be militarily and politically countered. How can the countries of the south enhance their external security in this emerging international system? 143

Rooted

Despite his national and international stature, Malcolm Adiseshiah, who passed away in Madras in last November, retained a very local identity. 142

LETTERS TO EDITOR

Dark Corners

THE Bangla bandh on December 22 was more or less a standardised specimen of the by now patented brand, but distinguished from others only by some of its bizarre qualities. Called by the state Congress (I) to condemn the murder of Ramzan Ali, a Forward Bloc MLA, in the MLAs' Hostel in Calcutta, the bandh was pointedly opposed by the Forward Bloc itself, along with, of course, the Left Front spokespersons.

Captioned in a leading Calcutta daily 'A ghastly end to a nefarious character', the story of this crime is very bewildering. Convalescing after an eye operation, Ali was strangled at midnight of December 20-21 in his bed at the MLAs' Hostel in the presence of his (second) wife and another woman, a former Gorkha League MLA. About two hours after the crime, the two women who claim to have been gagged and tied up by the assassins managed to set themselves free and ring up someone at another room in the same hostel through the intercom. Finally, the police was brought in after nearly two hours.

There are many intriguing elements in the reported account of the crime which will tax the credulity of any person. A high level investigating team has been set up at Jyoti Basu's intervention. This affair, however, sheds a lurid light on the moral sensibilities of a leading Left Front party and by extension of the leader of the Left Front, CPI(M). From all account Ramzan Ali was not exactly a man of sterling character. He was accused of involvement in many shady deals, including the siphoning of Rs 1.66 crore of funds from a co-operative bank. This charge is now under CBI investigation. Earlier, he was one of the accused in a murder case in his district. By now, owner of considerable property, Ali was reported to have been involved in smuggling with Bangladesh across the border. Yet, apart from being an FB MLA, he was also the president of his party's kisan organisation in the state. Reported to have been one of the main financiers of his party, he was seen to be close to the FB minister in charge of co-operatives in the Left Front government.

Certainly the Congress (I) did not cover itself with glory by seeking to paralyse the state on account of what is likely to be revealed as a sordid but private drama. The popular participation in the bandh was absolutely passive and partial and induced partly by considerations of personal safety and partly by opportunistic consideration of an unearned leave.

Solution of the murder mystery apart, Forward Bloc and the leading Left party CPI(M) surely owe the public an explanation as to how such a shady character could have

sneaked into a Left party and prospered under its protective wings so far. This is particularly relevant as the Left Front is in the front rank of the fight for probity in public life in parliament.

Hunger, Scarcity and Policy

FOR the past seven years we have organised a major conference, the Hunger Research Briefing and Exchange, in collaboration with Interaction, the American Council for Voluntary International Action. The eighth annual briefing will be held on April 5-7, 1995 at Brown University in Providence, Rhode Island.

The 1995 briefing focuses on the interplay of resource and policy factors that link vulnerability to hunger and capacities for sustained development in people's lives. Hunger usually is linked to resource scarcity, but are key intervening variables population growth or policy failure? In view of changing relationships of people to land, and peoples to states, how can government, intergovernment, and non-government (including community, field-based, and academic) programmes collaborate to make overcoming hunger part of the broader sustainable developmental goals of economic growth, positive political change, environmental protection, public health, and education?

Key topics to be addressed in the briefing include: the conflicting regarding the impact of economic liberalisation and GATT on food security; the politics of protecting the vulnerable in failed states; control of land and water resources by hungry populations; community involvement in nutrition improve-

ment and child health; household perspectives on agricultural productivity and food security; hunger in development education, and changing hunger scenarios in the US.

The briefing will offer an extensive exhibit of books and other publications and will be held in conjunction with the annual awards ceremony for the Alan Shawn Feinstein World Hunger Awards. More than 175 individuals from government and academic institutions and private voluntary organisations around the world typically attend the briefing.

Press in India

THE article 'Foreign Print Media Incarnating as Indian Fourth Estate?' by V R Krishna Iyer (December 3, 1994) is an enlightening exposition of the developments likely to be detrimental to the independence of India due to the entry of the foreign print media. His assertion that there are possibilities of abuse of the freedom of the Press and the domination will be difficult to repudiate. At the same time one is amazed that the writer has ignored of the lamentable monopoly of a few families in the realm of journalism. These have engaged writers of a community to be editors of their dailies and weeklies whose partiality for and identification with corrupt political leaders and eagerness to take refuge in the 'cult of silence' are well known.

Will It Last?

THECSO's index of industrial production (base: 1980-81=100) has risen impressively since the beginning of the current fiscal year. In the April-June quarter, the index rose by 7.3 per cent over the corresponding quarter of 1993-94 and in the July-September quarter by 8.8 per cent, thus yielding an industrial growth rate of 8.1 per cent in the first half of 1994-95 against 3.4 per cent in the first half of 1993-94 and 4.2 per cent in the second half. The index for the manufacturing sector rose by 8.8 per cent in April-September 1994 against 2.4 per cent in the comparable period of 1993-94. The use-based classification of industries shows an interesting pattern of growth. While the basic goods and intermediate goods groups have experienced a deceleration from 7.1 per cent and 10.8 per cent in the first half of 1993-94 to 4.3 per cent and 4.6 per cent, respectively, in the first half of 1994-95, the growth of the capital goods sector has picked up from -10 per cent to 23 per cent. There has been some improvement in the growth of the consumer goods group from 2.6 per cent to 6.4 per cent. Within the consumer goods group, while the growth of the consumer durables sub-group has continued to be high at 10.4 per cent it has decelerated somewhat from the 12.9 per cent achieved in the first half of 1993-94. Interestingly, the consumer non-durables group seems to be coming out of its long spell of low growth and has grown by 5.5 per cent compared to 0.4 per cent in the same period last year.

While spokespersons of industry and government have been exuding confidence that industrial growth will soon touch 10 to 12 per cent per annum, the nature of the growth so far does not suggest that such optimism is well-founded. In a number of industries, the recent growth has been in the nature of what may be termed 'replacement' growth after three consecutive years of decline in output. In fact, the output index for these industries is still well below that in 1990-91, four years ago. For instance, in the case of the capital goods industries group, the average index in 1990-91 was 291.7 whereas that in the first half of 1994-95 was only 277.6. Further, the overall growth rate has been raised above 8 per cent as a result of the very sharp rise in a few industries. The 32.1 per cent growth in the group 'electrical machinery, apparatus and appliances' and 16.8 per cent growth in 'transport equipment and parts' have been largely responsible for the rise in the aggregate index in April-September 1994. Within these groups, there have been striking increases of nearly 60 per cent in commercial vehicles, 17 per cent in passenger cars, 25 per cent in two-wheelers and 54 per cent in three-wheelers. Increases ranging from 20 to 50 per cent have occurred in refrigerators, cement machinery, lifts, power distribution transformers and textile and chemical machinery. However, in all of them, the level of output this year is still below that four years back. Except chemicals and chemical products and synthetic fibres, no other major industry

can be said to have grown in a sustained manner over the past three or four years.

The jump in output in particular industries is attributable to special circumstances. In the case of commercial vehicles, for instance, improved agricultural output in 1994-95, sizeable defence purchases, the railways' continued poor performance and induced demand from easy availability of bank credit have contributed to the sharp rise in output. Larger expansion of non-food credit (Rs 25,583 crore over the past 12 months against Rs 9,628 crore in the preceding 12 months) also contributed to the rise in demand for passenger cars and other consumer durables. For the capital goods sector, a sizeable contribution has come from the expansion in the output of commercial vehicles, though amongst the machinery items some like textile machinery, cement machinery, machine tools, construction equipment and some items of power equipment (power semi-conductors, turbines and electric generators) have also shown sizeable increases. With substantial backward and forward linkages with agricultural output, many items of intermediate and consumer goods have got an immediate impetus. In some agriculture-based industries, increase in exports too may have contributed to higher output.

The country has experienced seven good agricultural years, but investment in agriculture has been sluggish. The system of rural credit, which provided some impetus to agricultural growth in the 1970s and 1980s, is in disarray. The buoyancy in the overall availability of commercial bank credit, which originated in the sizeable capital inflow from abroad, may not also continue. Some strain in liquidity in the banking system is already in evidence and the consumer durables group has apparently begun to feel the pinch. The monetarist approach of the authorities is likely to induce them to restrain credit expansion by operating on interest rates. In any case, the persistent high rate of inflation will also erode purchasing power with the middle classes, thus affecting the demand for industrial goods and undermining domestic saving.

Industrial growth, if it is to be sustained, has to be supported above all by growth of investment in the economy. In this respect the available indicators are hardly encouraging. At the aggregate level, gross domestic investment has at best stagnated in the past few years. It touched a peak of 27 per cent of GDP at current prices in 1989-90 and thereafter fell to 25 per cent in 1991-92 and a little over 24 per cent in 1992-93 and 1993-94. Taking into account the likely picture of domestic saving and inflow of foreign capital, it is unlikely that domestic investment will exceed 25 to 25.5 per cent of GDP in the current year. Among the different components of investment, reports suggest that while investment in residential construction has picked up, that in factory construction and machinery and equipment has not.

Studies at the micro level confirm the above prognoses. Projections of corporate investment by the Reserve Bank of India on the basis of costs of projects sanctioned by the term-financing institutions suggest that the rate of growth of total capital expenditure in real terms has declined from 18.5 per cent in 1992-93 to 14.5 per cent in 1993-94 and further to 10 per cent in 1994-95. Similarly, a CMIE survey of 3,000 industrial investment projects on hand involving a total investment of Rs 7,76,444 crore shows a sharp rise in fresh investment intentions (45.7 per cent) but very slow growth in projects actually being implemented (4.4 per cent). The RBI study shows concentration of new project proposals in chemicals and petrochemicals (32.7 per cent) and metals and metal products (18.4 per cent). CMIE data show that power plants accounted for about 75 per cent of the increase in investment proposals between the end of 1993 and 1994. The CMIE survey has also brought out that a large number of projects have been stalled for one reason or the other, if they have not been abandoned outright. A frequent reason cited is the new competition that industry is facing from imports. This is particularly true of chemicals and petrochemicals, where reduction of customs duties has rendered projects unviable. A few steel projects have similarly been put on the shelf after the recent reduction in import duty on sponge iron and finished steel. Investment in the power sector has suffered for three major reasons: virtual stoppage of new investment by central government enterprises such as NTPC and NHPC, transfer of several projects earlier proposed by SEBs to the private sector with consequent delays and cost overruns and entanglement of the new power policy in controversies over high capital costs and non-transparent agreements for power purchase by SEBs based on assured returns and guarantees and counter-guarantees offered by the government to foreign investors.

Finally, under the present policy framework it is unlikely that export of manufactures will provide much momentum to industrial growth. Among the lessons to be learnt from the experience of industrialisation of the south-east Asian countries are that the state has to play an active role in industrial restructuring with clear priorities and that export growth will not be sustained unless it is knowledge- and capital-intensive, which in turn requires a dynamic technology transfer and absorption policy and also a policy for import substitution. The government's stance in these respects leaves much to be desired and the effects on industrial growth will be apparent even in the medium term of the next five years or so.

GUJARAT Factions to the Fore

WITH no third force in sight, the Congress and the BJP will be the main claimants for power in the coming assembly elections in Gujarat. But given the turn of events in the last year there is much to make both the parties circumspect about the eventual poll outcome.

The last assembly which came into being in 1990 went through notable shifts in power alignments. The late Chimanbhai Patel who formed the Janata Dal(JD) government with outside support of the BJP continued to remain in power even after the withdrawal of BJP support in the wake of the rath yatra. Chimanbhai Patel could achieve this feat by shrewdly delinking 67 out of the 70 JD legislators and constituting a Janata Dal (Gujarat) government with the help of Congress support. Later, JD(G) merged with the Congress in June 1992, taking the tally of the ruling party to 99 in an assembly of 182 seats.

Though officially merged, the factional divide between JD(G) and the Congress persisted. The upper caste countenance of the former hardly found favour with the latter which prided itself on its successful KHAM strategy of the 80s. The sudden demise of Chimanbhai Patel in February last year, a year before the scheduled assembly elections, created a leadership crisis. It took two months for the central leadership to ultimately sideline Urmilaben Patel, the widow of Chimanbhai Patel, and Prabodh Rawal, the chief of the state Congress unit, and opt for Chhabildas Mehta, the state finance minister, as the new chief minister. Thereafter, Madhavsingh Solanki, the chief architect of the KHAM strategy, attempted a comeback by first launching a campaign against Prabodh Rawal in May and then organising a convention at Bhavnagar in November demanding the purge of corrupt and criminal JD(G) elements from the Congress. The intention was clear: to get a larger say in the allocation of tickets for the coming assembly election. But Solanki's adventurism has backfired. The nomination of Ishwarsingh Chavda, father-in-law of Solanki, as the president of the Kaira district Congress resulted in an immediate retaliation from the JD(G) camp in the form of resignations (later withdrawn) of three ministers and six MLAs. And now the ticket distribution for the assembly elections next month shows that the JD(G) group has been able to corner 75 nominations compared to the Solanki faction which has got a paltry 10 seats. As a result, in spite of Prabodh Rawal's claim that almost all the rebel nominations have withdrawn, reports suggest that a large number of rebel Congress candidates remain in the fray.

But the BJP is not in a position to draw much comfort from the Congress infighting. Since June last year, out of the 10 states due to go to the polls, the BJP has been particularly hopeful about Gujarat. It had won 67 seats in the last assembly elections and 21 out of the

25 Lok Sabha seats. Further, the Congress rout in the assembly elections in Andhra and Karnataka had made the party particularly optimistic regarding the civic polls in Gujarat in December. Out of the 54 municipalities and nagar panchayats for which elections were held, BJP contested 50 while the Congress decided to play safe by contesting only 25 and supporting independents in the remaining. In the event the BJP performance was unimpressive. Though it improved upon its previous position by gaining control of 14 civic bodies, the achievement was far below its expectations. The party won 607 out of the 1,443 seats it contested and suffered major setbacks in its strongholds of Kutch, Saurashtra and north Gujarat. The debacle brought the simmering tensions within the state BJP to the fore. Shankersinh Waghela, MP, and Kashiram Rana, the state unit chief, blamed Keshubhai Patel, the leader of the opposition, and Narendra Modi, the RSS strongman, for sidelining long-standing party workers and favouring candidates with a RSS background. The internal bickering has resulted in sprouting of rebel candidates all over the state for the assembly elections.

Thus both the Congress and the BJP are plagued by similar problems. Yet till now Gujarat has never been a fertile terrain for a third force to emerge. On both the occasions when such a development did occur – Kisan Mazdoor Lok Paksha in 1975 and JD(G) in 1990 – it was Chimanbhai Patel who achieved the feat, on the basis of the cohesive patidar lobby. Kanshiram's attacks on Gandhi have alienated the Gujarati populace from the Bahujan Samaj Party (BSP). Though the BSP won 12 seats in the recent civic polls, all of them are from predominantly Muslim areas. This indicates that the Muslims in the state desire a new political formation, but given the pathetic condition of the state JD and the rawness of SP-BSP, in this election at least they will have to suffer their agony in silence. In fact muslims, dalits and backward castes constitute 76 per cent of the state's population. But the anti-reservation riots which snowballed into anti-Muslim riots in the 80s have driven a wedge between them and made an alliance of these forces difficult. The biggest gamer of this communalisation has been the BJP which has made significant inroads among the SCs, STs and OBCs. This development has forced the state Congress to rely on the patidar community. Thus with KHAM marginalised, only a united show by its various factions on the lines of Madhya Pradesh can assure the Congress of success.

CPI(M)

Note of Dissent

A correspondent writes:

THE veteran CPI(M) leader Nripen Chakravarty has become the centre of an embarrassing controversy for his party. Some days ago in the course of informal

talks with some local journalists from his hospital bed in Calcutta, he denounced in very sharp language the anti-working class policies of the West Bengal Left Front government and deplored the stink of corruption in the ranks of the state CPI(M). This naturally found its way into newspapers. Not only was he immediately removed from the easily accessible ward to the inaccessible cardiac ward, Jyoti Basu publicly declared that Chakravarty had been retired because of his old age from the politburo of the party. Indeed, even though Chakravarty soon thereafter left the hospital, he did not participate in the PB and CC meetings then in session in the city, although he was still here.

Soon afterwards, Chakravarty went back to his normal residence at Agartala in Tripura and is reported to be well enough to resume his normal life. He has not, however, repudiated or retracted his reported statements. In the meantime, on January 8, UNI circulated a message from New Delhi about the CPI(M)'s denial that he had been removed or retired from his party positions. This is understandable. Although there are historical instances of arbitrary removal of members from party positions or even their suspension and expulsion, the principles of communist party organisation do not permit such steps without giving the concerned person an opportunity to be heard. Violation of this principle has occurred and can occur only in underground conditions of party functioning which is not the case today.

Even if Nripen Chakravarty has not been removed from PB/CC by the leadership, the fact remains that by his public outburst against the leading unit of the party and, by implication, its most important leader today, Nripen Chakravarty has violated the normal party code. Whether the party proceeds against him remains to be seen. If it does, then it may lead to even more embarrassment to the party leadership. The old war horse that he is, Chakravarty may decide to gird up his loins for a battle royal, more so since truth, and absolute truth, is on his side.

SOUTH AFRICA

Restitution, Not Redistribution

LAND reform has begun in earnest for the settlement of people who were forcibly removed and a legislative framework has been set out to address land disputes arising from apartheid, in the form of the Land Claims Commission and the Land Claims Court. This is about the only specific legislative measure that president Nelson Mandela referred to in his new year-eve address, indicating not merely the government's and, even more, the ANC's sense of achievement over the passing of the measure but also of the high expectations raised. In the perception of the ANC, as spelt out in the report of the land affairs ministry

appended to the ANC secretary-general's report to the 49th national conference at Bloemfontein last month, the passing of the Restitution of Land Rights Bill by parliament on November 8 last year was a notable contribution in the resolving of "the crucial issue of land reform in a sensible, practical and democratic manner".

The legislation however provides only for the restitution of land rights, and is directly concerned with the undoing of the various apartheid laws, beginning with the Native Lands Act, 1913, and all the subsequent legislations that followed from it, by which the share of land of the black people constituting over 85 per cent of the population (75 per cent if one limits the concept of 'black' to Africans) was restricted to a mere 13 per cent of the total area of the country - the arcademarcated as the erstwhile 'homelands' - as well as the Group Areas Act of 1950 by which millions of people were forcibly removed from lands on which they had lived for generations. The generally agreed estimate is that around 3.5 million people were forced out of their lands subsequent to the Group Areas Act alone, apart from the many more millions relocated in the so-called homelands even if only notionally.

The proposed process of restitution applies to the 'dispossessed communities', a description that is applicable to those forcibly removed under the provisions of the Group Areas Act, the so-called apartheid removals. In the words of the land affairs ministry report, "the Bill [now an Act] makes provision for the restitution of right to land to persons or communities dispossessed of such a right under or for the purpose of furthering the objectives of racially discriminatory laws". But the fact is that black loss of land predated the apartheid laws - a point made not merely by the Pan Africanist Congress of Azania (PAC) but also by the Contralesa (Congress of Traditional Leaders of South Africa), the pro-ANC organisation of 'traditional leaders' whose annual general meeting last month recommended that the retrospective date for the restoration of lost land should be April 6, 1652, the day on which the first Europeans landed on the Cape coast. It was on the ground that the legislation provided only for restitution of land and not for its redistribution that the PAC opposed the bill when it was introduced in parliament.

The ANC does recognise the problem and proposes to tackle what it calls the "legacy of racially skewed land distribution" by redistribution which is to be "principally effected through state-assisted processes on the one hand and through market mechanisms on the other". State-assisted land acquisition is to include the allocation of state-owned land, directed at those in need of land for residential settlements and for agricultural purposes. The reconstruction and development programme (RDP) too calls for redistribution of 30 per cent of agricultural land over the next five years; and the land

affairs ministry has budgeted rand 316 million (approximately Rs 300 crore) for land reform pilot projects in selected districts of the nine provinces.

The problem however is that the official figures of available state-owned land (about 2,50,000 hectares) will hardly meet the requirements, let alone the expectations, of the landless. Quite simply, the problem cannot even be touched without affecting the powerful 'farmer' lobby, comprising almost solely of prosperous white 'farmers' whose organisation, the South African Agricultural Union (SAAU) made its clout felt by securing significant modifications in the Restitution of Land Rights Bill at the time of its introduction.

The proposed 'market route' to effect land redistribution is acknowledged in the ANC document itself as being limited by legislative, administrative and financial constraints. In the words of the document: "Part of the land reform programme tried to ensure that people are able to buy land on the open market. However, there are financial constraints: a rural finance enquiry has been established as a presidential commission. There are also legislative and administrative constraints, notably the sub-division of agricultural land tax."

RECENT PUBLICATION

Science in Society: Some Perspectives". Edited by Prof. Yash Pal Ashok Jain and Subodh Mahanti. *Gyan Publishing House, New Delhi, 1994, Rs.400.00, pages xvii+405.*

The book containing twenty three articles views science as an integral part of social activity and not as an alienated sub-culture.

A distinctive contribution of the book lies in bringing together distinguished specialists from areas as diverse as physics, earth science, philosophy, economics, law, information science, science policy, agriculture and modern biology.

The themes covered by the book are Science and Spirituality; Excellence, Equity and Information Need in Science Education; Science Peace and Social Development; Challenge and Excitement in Science; Intellectual Property Rights; and Alternative Paradigms of Development.

Orders may be placed with either the publisher or NISTADS

CURRENT STATISTICS

EPW Research Foundation

1994 has ended with a 10 per cent inflation rate, a 20 per cent rise in M_3 and a 25.7 per cent expansion in reserve money. Scheduled commercial banks' deposits rose by 19.2 per cent (Rs 57,856 crore), advances by 18.1 per cent (Rs 28,659 crore) and investments by 26.3 per cent (Rs 31,685 crore). With around 3 per cent and 6 per cent increases in income originating in agriculture and industry respectively, GDP growth is estimated at about 5.2 per cent in 1994-95. Capital market activities have declined since September 1994. Foreign exchange reserves (other than gold) have been depleted by about \$ 770 million in the past two months.

Jindal Vijayanagar Steel

PROMOTED by JISCO and associated companies belonging to the Jindal organisation and the Karnataka State Industrial Investment and Development Corporation (KSIIDC), the company is setting up an integrated steel plant with a capacity of 1.25 million tons per annum of hot rolled coils at Torangallu in Bellary district of Karnataka, which has rich iron ore reserves having iron ore content up to 67 per cent. The company plans to use the COREX process which it proposes to procure from Voest Alpine Industrieanlagenbau (VAL), Austria. VAL is to provide the company technical details for the site work and performance guarantee in respect of productivity, coal consumption, top gas generation and calorific value of top gas. The process is non-polluting and generates insignificant quantity of effluents, fumes and dust as compared to the conventional steel-making process and hence is environment-friendly. The company proposes to sell its products through the established marketing network of the group. The project has been appraised by ICICI and the cost is estimated at Rs 3,300 crore. To part finance the project the company is entering the capital market with simultaneous but unlinked public issues of 13.5 crore equity shares of Rs 10 each at par and partly convertible debentures (PCDs) of Rs 40 each. The convertible Part A of Rs 20 of each debenture will be converted into two equity shares at par on allotment. The non-convertible Part B of Rs 20 is to carry 14 per cent interest payable half yearly and will be redeemed at par in four equal instalment at the end of the 6th, 7th, 8th and 9th years after allotment. The issue, slated to open on February 10, is being lead managed by ICICI Securities and Finance, Creditcapital Finance Corporation, IDBI, PNB Capital Services, SBI Capital Markets and Jardine Fleming India Securities.

CRB Capital Markets

Promoted by CRB Group, CRB Capital Markets has established itself as a front ranking finance company in the country providing a whole range of financial services from conception to completion. The company is registered as NBFC with the RBI and has been engaged in leasing

and hire purchase since its inception. The company is registered with SEBI as a Category-I merchant banker and a member of OTCEI. It has the top position among private merchant bankers in the country. The merchant banking division undertakes issue management, promoter's funding, loan syndication, etc. The other activities of the company are corporate financing, equity research and analysis and investment banking, sponsoring of mutual funds, OTCEI, fixed deposit mobilisation, security trading and capital market operation, consumer finance, international finance and NRI services and portfolio management. The company wants to increase its capital base for expanding leasing and hire purchase for investments in joint venture projects and for enlarging its existing branch/franchise network and setting up new branches and franchises abroad. These business plans have been appraised by Indian Overseas Bank and the cost is estimated at Rs 424 crore. To part finance this the company is entering the capital market with a public issue of 86.75 lakh equity share of Rs 10 each at a premium of Rs 90 per share aggregating Rs 86.75 crore. The issue, which is slated to open

on January 31, is being lead managed by Indian Overseas Bank and IFCI.

Rajdoot Paints

Rajdoot Paints, engaged in the manufacture of paints, has a wide range of products which have their application in domestic and industrial uses. The products are marketed under the brand name Rajdoot, Spred and Yak. The company is entering the capital market on January 31 with a public issue of 30 lakh equity shares of Rs 10 each at a premium of Rs 65 per share aggregating Rs 22.50 lakh. The stake of the promoters and associates in the post-issue equity will be 62.5 per cent. The company has been promoted by people who have decades of experience in the field and does not propose to undertake any new manufacturing activity. Therefore no gestation period is involved. One of the main purposes of the issue is to augment long-term resources for working capital requirements. The company proposes to install some machinery for improving its product quality and reducing process loss. The issue is to be lead managed by Allianz Capital and Management Services and ITC Classic Finance.

Call for Papers

Indian School of Social Sciences, Calcutta, 66 Acharya Prafulla Road, Calcutta-700009 will organise, in Calcutta, a 3-day Seminar on "Globalisation and its impact on India" in the 4th week of March 1995. Papers are invited from Social Scientists on economic, social and cultural aspects of Globalisation which should be sent before 11th March 1995.

SEARLE (INDIA)

Improved Performance

SEARLE INDIA, the pharma-cum-pesticides firm, has done well in 1993-94 after having suffered a decline in its margins the previous year. Net sales were Rs 103.25 crore (5 per cent rise), operating profit Rs 14.53 crore (up by 21 per cent) and net profits rose by 32 per cent (from Rs 4.41 crore to Rs 5.83 crore). The results were helped by increase in other income by Rs 1.23 crore and decline in interest charges and depreciation by 4 per cent. The dividend was raised by 8 per cent to 28 per cent. Debt-equity ratio has fluctuated at 39 per cent in 1991-92, 44 per cent in 1992-93 and 9 per cent in 1993-94. Sales to total assets and sales to gross fixed assets ratios have steadily increased over the past three years. Remuneration to employers has been fluctuating at 35 per cent in 1991-92, 37 per cent in 1992-93 and 34 per cent in 1993-94.

Searle India has two divisions, agrochemicals and pharmaceuticals. The agrochemical division accounts for 55 per cent of turnover and the larger part of profits. The company's fenvalerate is a market leader and is its largest selling product. It accounts for nearly 55 per cent of the agrochemical division's turnover. Searle's chloropyrifos (an insecticide-cum-ovicide) is also a market leader and has achieved this status in a short span of two years. The company has also introduced a wide range of other products like monocrotophos, cypermethrin, butachlor and dimethoate.

The pharmaceutical division was for some time a marginal player in the market since the company was diversifying itself into agrochemicals. But in 1993-94 the company's bulk drugs fared well with sales doubling. Lomofen, an anti-diarrhoeal, is a leading product. The company plans to launch a number of pharmaceutical products in the next two years and has been looking for suitable foreign collaborations.

The company invested Rs 79 lakh in R and D in the year, 25 per cent more than in the previous year.

KESAR ENTERPRISES

Fruits of Expansion

Kesar Enterprises has done well with net sales at Rs 94.55 crore in 1993-94. Operating profit (Rs 17.95 crore) went up by 19 per cent, while net profit more than doubled from Rs 2.11 crore to Rs 4.56 crore, despite Rs 35 lakh being paid as taxes (nil), increase in depreciation and interest charges by Rs 28 lakh and Rs 15 lakh. There was an increase

in other income of 18 per cent. Non-operating profit was Rs 6 lakh compared to a loss of Rs 20 lakh in the previous year. Exports fell further by Rs 7.33 crore (59 per cent) after an 18 per cent decline in the previous year. Imports were also down to Rs 7 crore against Rs 18 crore in the previous year. A 30 per cent dividend was declared for the year. Debt-equity ratio fluctuated at 73 per cent in 1991-92, 110 per cent in 1992-93 and 34 per cent in 1993-94. The sales to total assets and sales to gross fixed assets ratios have grown steadily in the past three years. Remuneration to employers has been steady at 26-27 per cent in the past two years.

The expansion and modernisation programmes started by the company a few years ago have begun to yield results. The sugar division's plants ran at a crushing rate of more than 4,500 TCD and the crushing capacity is expected to rise to 4,800 TCD in the coming season. Production in the distillery division declined from 108.68 kilo litres to 88.51 kilo litres. The problem of contamination forced closure of the plant for some time. The problem has been overcome. Production and distribution of country liquor has been satisfactory. The working of the ENA plant was stabilised and the product was found to be of good quality and the market is said to have accepted it. Since the demand for hiring tanks has been steadily growing, the DTC division has undertaken an expansion project at Kandla port at an estimated cost of Rs 15 crore which, when fully implemented, would double capacity. The project is to be completed by May this year.

Indian alcohol prices having gone up, the company now finds it unfeasible to export alcohol. The UP government continues to control 65 per cent of molasses production including its price, and 35 per cent is available for the free market sale. Due to this there was a shortage and prices shot up.

Kesar Marble and Granite is a wholly-owned subsidiary and incurred a loss in its first full working year. This was largely due to difficulty in procuring raw materials.

The company spent Rs 11 lakh on R and D. The R and D department has been involved in projects relating to by-products of the sugar factory, alcohol and methods of improving methane generation.

MADHUSUDAN INDUSTRIES

Rise in Profit

Madhusudan Industries manufactures vanaspati, refined oils, sanitary ware and glazed tiles and has done well in 1993-94. Net sales went up by 3 per cent, operating profit by 7 per cent and net profit by 91

per cent (from Rs 2.45 crore to Rs 4.68 crore). A 72 per cent growth in other income and increase in non-operating surplus from Rs 22 lakh to Rs 104 lakh, nil taxation and an 8 per cent decrease in depreciation and 17 per cent fall in interest charges all helped to keep margins high. An enhanced 30 per cent dividend was announced for the year. Exports were down by 21 per cent while imports increased by 23 per cent. Though the sales to gross fixed assets ratio declined by 76 percentage points over the past three years, it was still high at 298 per cent in 1993-94. Sales to total assets ratio declined by 35 percentage points over the past three years. The debt-equity ratio fluctuated at 57 per cent in 1991-92, 159 per cent in 1992-93 and 47 per cent in 1993-94. Raw materials consumed to value of production has remained steady at 65 per cent.

The recession in the oil industry coupled with the emergence of new vanaspati manufacturing units enjoying sales tax relief have adversely affected the competitive position of the company in Rajasthan and Maharashtra. Despite this the company has been doing well and production increased by 4.5 per cent and capacity utilisation was higher than the industry average. Excess capacity in the solvent extraction industry squeezed the company's margins. Frequent power interruption increased processing cost and lowered production in the solvent plant at Nimbahera. To overcome the problem, the company has installed a DG set.

Production of sanitary ware and ceramic tiles was lower by 530 mt and 978 mt respectively. This is attributed to labour unrest and disruption in gas supplies. The modernisation and expansion programme in the sanitary ware unit was completed in December 1994, raising capacity to 16,000 mt per annum. The company installed screen printing machines in the tiles unit during the year.

The company is diversifying into the energy sector by setting up a wind farm for generating 5 mw for captive consumption at a cost of Rs 20 crore in two phases. For the first phase the Indian Renewable Energy Development Agency has sanctioned a term loan of Rs 708.5 lakh. Allotment of land from the Gujarat Energy Development Agency is awaited.

The company has been undertaking R and D activities in development of new products with new designs as well as the development of new body and glaze for the ceramic division. The company is in the process of developing its refractories to improve the quality of the plaster of paris.

SUPREME INDUSTRIES

Diversification Programme

Supreme Industries has done well in 1993-94 with net sales going up by 25 per cent, operating profit by 36 per cent and net profit by 37 per cent. This is commendable after the previous year's decline margins. Though depreciation was up by 40 per cent and interest charges by 29 per cent and non-operating surplus went down by 18 per cent, the bottomline was sustained by the 146 per cent increase in other income. A dividend of 50 per cent was declared for the year against 40 per cent for the previous year.

Exports were Rs 10.17 crore against Rs 6.61 crore in the previous year. Gross fixed asset formation declined drastically in the year. Debt-equity ratio has risen by 51 percentage points in the past three years. Sales to total assets and sales to gross fixed assets ratios have declined in the past three years. Return on investment also declined to 6 per cent in 1993-94. Short-term bank borrowings to inventories fluctuated at 36 per cent in 1991-92, 73 per cent in 1992-93 and 38 per cent in 1993-94. Remuneration to employees to gross value added ratio has fluctuated at 11 per cent in 1991-92, 15 per cent in 1992-93 and 13 per cent in 1993-94. Net value added to value of production ratio has declined in the past three years.

The company plans to embark on a modernisation, expansion and diversification programme. The industrial components business improved, thanks to the pick up in demand from the automobile and consumer durable industries. Materials handling cranes received a boost with the company supplying cranes to Coca-Cola and Pepsi Cola. The demand for moulded furniture has improved and the company has launched several new models of moulded furniture. It has also increased its furniture items capacity. AK Structural Foam was merged with the company.

The packaging division saw substantial expansion. The wide width film plant has already gone into production. This has opened up opportunities for making several new constructions of flexible packaging materials. The increase in demand for protective packaging products has also opened new avenues for investment.

The PVC pipes and fitting division has been working well and the company is planning to increase the volume and variety of products. The focus is on increasing the volume of specific products for the export market which has seen successful launching of several new products. Steps to augment the capacity of the fittings division by 1,800 tons per year have been undertaken. The

MLS division fared well with the refrigerator industry coming out of the recession.

Siltap Chemicals has enhanced capacity by 500 tons. The enhanced capacity has gone into commercial production. Further increase in capacity is being planned considering the growth in demand. Klockner Supreme Pentaplast, producing rigid PVC film and sheeting, has met with success in the market and hence has decided to increase its capacity. Supreme Petrochem and Mupnar Films has collaborated with Huntsman Couti (Hong Kong) to put up a plant to manufacture 1,500 tons of extended polystyrene foam food packaging products per year with an investment of Rs 20 crore. Huntsman Couti and Supreme are to have equal rights in Huntsman Supreme. Supreme Industries is to invest Rs 4 crore and the unit is expected to go into production by the end of this year.

The company has been carrying on R and D in the areas of cost reduction, modification for higher productivity and development of new products.

CEMINDIA

Expanding Operations

Cemindia Company, subsidiary of Tatalgar House Plc of UK renamed as Tatalgar House Construction, has done well with net sales going up by Rs 48 crore, operating profit by 103 per cent and net profit by 124

per cent. Though taxation increased a 153 per cent, depreciation by 34 per cent, and interest charges by 15 per cent and there was a 33 per cent decrease in non-operating surplus, net profits still remained high. Encouraged by the performance, the company declared a 40 per cent dividend for the year. Sales to gross fixed assets and sales to total assets ratios remained high at 507 per cent and 171 per cent. Earning per share has increased from 4 per cent in 1991-92 and 11 per cent in 1992-93 to 26 per cent in 1993-94. The company has given its shareholders a bonus issue in the ratio of 1:1. Remuneration to employees has seen a decline from 59 per cent in 1991-92 and 55 per cent in 1992-93 to 43 per cent in 1993-94.

The operations of the company have expanded substantially. New contracts for a total value of Rs 17,600 lakh were signed. Some of the major contracts include marine and civil works at JNPT, shipyard in Goa, Tuticorin Port Trust, North Madras power station project, Calcutta Port Trust, construction of bridges for UP government and IRCON, diaphragm working and anchoring and civil works for parliament library building in New Delhi.

The R and D department of the company has been recognised by the government's Department of Science and Technology. The department assisted in evolving system for liner protected piling and mechanised jetty construction.

PSYCHOANALYSIS AS A HUMAN SCIENCE: BEYOND FOUNDATIONALISM

BHARGAVI V DAVAR and PARAMESHWAR R BHATT

The precise status of psychoanalysis has been the subject of considerable debate in recent years. Widely known as the 'foundations of psychoanalysis', this debate revolves around whether psychoanalysis can be treated as a cognitive science and, in turn, involves the epistemological status and ethical underpinnings of this theory.

This highly original work is an important contribution to the debate. In particular it challenges Karl Popper's critique of and Adolf Grünbaum's virulent attack on psychoanalysis. Contrary to Popper's view of the psychoscientific nature of the theory, the authors of this book provide an epistemological rationale for its scientificity and an ethical rationale for its humanism.

Andhra Elections: What Happened and What Did Not Happen

K Balagopal

The voting statistics do not show that it was the cheap rice scheme and prohibition that were primarily responsible for the Telugu Desam Party's phenomenal victory. What is striking is not the increase in TDP votes, but the fall in Congress votes by as much as 12 to 14 percentage points.

I

SOMEBODY has remarked tongue-in-cheek that the two-party system has come to stay in Andhra Pradesh. The characteristic feature of this much hankered after state of political grace is that there are two hardly distinguishable political formations each with its own constituency of loyal voters, while the non-loyal voters shift from the one to the other in sufficient measure from one election to the next to ensure that governments keep changing with predictable regularity, if not an entirely predictable periodicity. Critics lacking in the blessed spirit of charity will call it a Tweedledum-Tweedledee political system, but it is no doubt better than having a single Tweedledum ruling in perpetuity. For one thing, while the general social and political character of the government remains the same from one change to the next, there is some check on how cavalierly the rulers can play games with the people. Congressmen of Andhra Pradesh who took their power for granted got a shock this time that they have not recovered from even a month afterwards. Secondly, the competition for the votes of the elusive voters who sit on the fence and amuse themselves by voting this way once and that way the next time does lead to however partial an attempt to meet the dire needs of the voting public at large, a healthy fall-out of political uncertainty that Manmohan Singh's admirers describe as populism. Blessed is this populism without which many more would have starved to death in this land which is marching from brahminical cruelty to capitalist cruelty, from the rule of dharma to the iron rule of the International Monetary Fund. And thirdly, there is this thing called empowerment of the powerless that everyone talks of a lot these days. One is not talking of the gratuitous empowerment that the CPI and CPI(M) are enjoying in Andhra Pradesh this season, but the empowerment of what the Supreme Court has with unfelicitous contempt described as the 'creamy layer' of the dalits and the backward castes. For all its much despised creaminess this class or class-fraction would have had little chance of coming close to

positions of power if a Congress clone such as the Telugu Desam Party had not come about and afforded the dynamic among the lower castes a chance to play one party against the other and push themselves into positions of power in this party or that. This too, of course, is 'populism', for it is not necessarily congruent with the most efficient use of the nation's resources that is the ruling dogma of today's India.

All this is not to say that alternatives to the Congress such as the Telugu Desam Party are the best that could have happened in this best of all possible worlds, for that would be taking a needlessly pessimistic view of an admittedly imperfect world. For the deadening effect that this replication of the Congress by other names has on the political culture of a people is an incalculably vicious consequence of the emergence of charismatic fakes such as N T Rama Rao. The purpose of this prologue, rather, is to caution against contemptuous attitudes towards 'populism' on the one hand, and on the other against the inability to see that in human affairs desirable ends can and frequently do realise themselves in seemingly immaterial, utterly uninspiring and even incongruous changes. The human historical agent is no match for its own glorious aspirations, and as much progress in its affairs (as well as resistance to retrogression) is wrought by incongruous irrelevancies as by revolutionary planning and firmness.

It is necessary also to caution against a third attitude, which is being developed into a whole myth by CPI(M) circles. This is to read in the recent victory of the Telugu Desam Party a rejection of P V Narasimha Rao's economic reforms. The CPI and the CPI(M) are at liberty to collect all manner of political creatures – including Congress clones, crooks and opportunists who would rather be in the Congress than outside it – around them; and in this free world one cannot prevent them from christening this motley grouping a left and democratic alliance or a national alternative or whatever; but one should firmly insist that they stop interpreting reality to suit their tactics. Assuming that the TDP won on a vote for cheap rice, that only

indicates popular resentment at rising prices and hungry stomachs. It is part of an unfortunate culture of interpretation that has become common with marxists to argue that since the recent spurt in prices is a consequence of economic liberalisation, the vote against price rise is objectively a vote against liberalisation. The gap between this reductionist interpretation and the actual consciousness of the people is an abyss that renders the interpretation a particularly bad case of wishful thinking. It is the wishful realisation of two elusive desires: one, that the people at large should recognise that economic reforms are bad for them, and should consciously reject them; and two, that the left forces should succeed in leading the people to the realisation.

It is of course a matter of delight to believe that the Telugu people stood up firmly against the prime minister's regressive economic policies and gave the old man a resounding rebuff for having presumed that because he is a 'child of the Telugus', the state would vote by him in a time of crisis. It is indeed true enough that the sentimental response that he expected (he used the word *bidda* which means daughter rather than son in his native Telangana, and in general Telugu usage connotes the child in its dependent and helpless aspect) was not forthcoming from the electorate. And yet, happy though one would be to arrive at such a conclusion, there is little reason to see the defeat of the Congress as principally a rejection of the prime minister's presumptuous appeal for support to his structural adjustment policies. Of the three reasons offered for the victory of the TDP – rejection of the economic reforms, vote for NTR's cheap rice and prohibition policies, and infighting of the Congress – the third and the least glamorous appears to have been the most significant, however reluctant we may be to accept such unromantic conclusions. Economic reform in the abstract was an irrelevant matter not only because the people at large are far from being aware of its implications and conscious in rejecting it, but also because NTR is hardly anti-liberalisation. He is, like most Congressmen, as much a convinced advocate of the philosophy of the market as he is utterly feudal in his cultural attitudes, and the Telugu Desam Party has never spoken out against liberalisation as such, though it has put to skilful electoral use the consequent price rise.

The cheap rice scheme has no doubt attracted people, and quite rightly, whatever may be said by persons who are worried about budgetary discipline. The question of budgetary profligacy cannot be divorced from the larger question of how and on what basis the nation's resources are being shared out, and when that is left either to the bureaucrat-politician nexus or the laws of the capitalist

jungle, in neither of which the weak have any place, they are bound to seek protective schemes from the government on pain of voting it out, especially because what such schemes eat into is administrative or infra-structural investment of a kind that does not solve their food and employment problems, except by way of an unredeemable assurance.

Much the same can be said about prohibition. The movement for total prohibition that appeared on the scene in Andhra Pradesh after country liquor (arrack) was banned in 1993 upon pressure from the rural women's struggle, was in fact not a movement to match the earlier anti-arrack struggle. The modern variety of inebriating fluid called IMFL is a middle class, lower middle class and organised working class men's addiction, and while women of these families are as much its victims as women of rural labouring classes are of arrack, they did not come out into the streets as the latter did. The total prohibition agitation was a meetings and seminars affair promoted through the press by Ecnadu, a paper that combines anti-Congressism with a determined effort to recreate lost legitimacy for the state's ruling elite. And yet, both the main political parties were fearful of the appeal the issue may have for women voters. Men are evidently never fully sure that the weighty arguments they offer (ranging from reasons of common sense to those of fiscal sense) for their inability to cure themselves of the addiction to drink as a habit and their addiction to the business of drink as a very lucrative economic activity, will ever convince women who suffer physically, emotionally and economically from it. And so NTR jumped in and declared that he would impose total prohibition within half an hour if he was voted to power, and the Congress chimed in saying that (though nobody believed them) they too would do so in due course, no matter that both the parties are chockful of manufacturers and vendors of liquor, licensed or illicit.

And yet, voting statistics do not show that it is the cheap rice scheme and prohibition that were primarily responsible for NTR's phenomenal victory. The percentage of votes the TDP and its allies got this time was not substantially higher than what they got last time, though as the polling percentage was higher this time, it means that a larger proportion of the electorate voted for them. What is striking is not the increase in TDP (plus allies) votes, but the fall in Congress votes, which appears to have been as much as 12 to 14 percentage points. A small part of these votes went to the TDP, another small part went to the BJP and the BSP, but the major part of it went to Congress rebels. This cornering of votes by Congress rebels is a very significant fact revealed by the voting statistics. The Congress has truly become a veritable jungle of clawing and biting wild animals which are unmindful

of the possibility that they will destroy the species in the process. No tears need be wasted over this, but their unconcern is a study in depravity. In district after district it was senior Congressmen who first of all played all possible dirty games to get candidates of their choice nominated, and when they failed against the wily Congress president who can play as dirty games as any of them, they set up their own candidates against the official nominees, or otherwise queered the pitch for their party. Members of parliament Dronamraju Satyanarayana in Visakhapatnam, Vizianagaram and Srikakulam districts; Magunta Subbarami Reddy in Nellore and Prakasam districts; Y S Rajasekhara Reddy in Cuddapah and Anantapur districts; Rayapati Sambasiva Rao in Guntur district; Ganga Reddy in Nizamabad district; former union minister Jalagam Vengal Rao in Khammam district and smaller fry elsewhere did their worst to get Congress candidates defeated. Their success in this effort was the most significant factor in deciding the huge margin of the Congress' defeat.

It is not that but for this the Congress would have won. The prohibition, the cheap rice scheme and general disgust with the Congress had done enough to stabilise the normal TDP vote and to decide the minds of the fluid voters. But for Congress infighting, it appears the TDP would in any case have won but with an unspectacular margin that would have left no scope for the largely misplaced encomiums the Telugu electorate is receiving for its perspicacity, firmness and wisdom, nor any room for myth-making about popular rejection of the structural adjustment policies.

II

Apart from the price rise, and resultant deterioration of living conditions, the other significant issue in the elections was whether and to what extent persons of scheduled castes, tribes and backward castes would come into positions of power in the changed context of post-Mandal politics. Such an aspiration can be dismissed as seeking power 'within the present oppressive system' as many Marxists have done, but since it is precisely one of the oppressive characteristics of the present system that positions of importance and authority are denied (both by virtue of the socio-economic structure and by conspiratorial tactics) to persons of the lower castes, such an aspiration is not a desire for change 'within the system' but is an attempt to dent the system along at least one dimension. This much is true, whether one believes that this will in due course generalise itself into a larger assault on the system in all its oppressive dimensions, or one suspects that it will end with a widening of the social base of the Indian state and capital. Indeed, which of these will happen is not something that can be predicted beforehand.

The victory of the SP-BSP in Uttar Pradesh on the basis of an explicitly anti-Hindutva campaign inspired many dalit activists in Andhra Pradesh to join the Bahujan Samaj Party and try to build it into a major political force in the state. Kanshi Ram, too, took a lot of pains to campaign in the state. The dalit movement has developed into an important political force in AP in the last decade, and a very sizeable part of the movement joined the BSP, unfortunately bringing with it its internal contradictions too. The other sizeable stream to join the BSP (especially in the Telangana districts) was that of former naxalites, of whom K G Satyamurthy and Chiranjeevi are the most prominent.

Nobody expected the BSP to win many seats in the elections, though BSP leaders, in imitation of the dominant political culture whose tone is set by the Congress, made vastly exaggerated claims about the seats they would win and the policies their government would adopt, and while the overstatement was very evident, most people were wary of cautioning them for fear of being dubbed anti-dalit, a term of abuse as potent today as 'petit bourgeois' was in the heyday of the now faded glory of communism. As it happened, the BSP won no seats and indeed it lost its deposit in all but one constituency, the exception being Bapatla in Guntur district where Katti Padma Rao, founder-general secretary of the A P Dalit Mahasabha did quite well.

But the entry of the BSP into electoral politics of Andhra Pradesh in a big way signifies not the possibility of immediate political power but the shifting of dalit political consciousness from the agitational arena to the electoral arena and its consolidation therein as a political party. If the BSP leaders had acknowledged this distinction, disciplined their claims accordingly, and concentrated on organisational work and on the elaboration of the full logic of their principal campaign slogan: 'vote hamara, seat tumhara - nahin chalega, nahin chalega', they need have caused no disappointment to their hopeful followers and sympathisers at the end. They spoilt things by neglecting organisational work to the point that they went through the elections without any organisational structure at all, dependent solely on Kanshi Ram's image and the appeal of their ideology; by making no attempt to set right the internal divisions which soon became public in ugly scenes at the time of seat allotment; and by allowing disenchanted SC and BC leaders from the Congress and TDP for whom the dalit activists have no regard to enter the party and acquire importance in it.

The other outcome expected from the entry of the BSP was that whether the Congress won or the TDP won, more persons from the lower castes would attain positions of political importance, which also would be

a social advance irrespective of what one thinks of the Congress and TDP as political parties. For the first time perhaps in the history of the Congress Party, backward caste and scheduled caste leaders talked openly about the injustice done to the lower castes by the Congress leaders in the allotment of seats and offices. Though they would add the ritual declamation that Kanshi Ram was an adventurer and that the Congress alone would solve the problems of dalits under the leadership of P V Narasimha Rao, 'great friend of the weaker sections', it was evident that they owed their new-found courage to that very adventurer and not to the great friend of the weaker sections. On the other hand, the Congress leadership became jittery at the large turnouts that attended Kanshi Ram's public meetings in the beginning. Vijaya Bhaskar Reddy, the Congress chief minister of the state, mobilised Congress leaders of each of the toiling castes to hold rallies of that caste at Hyderabad to which he himself would be invited as chief guest and would promise all things under the sun to that community: subsidised yarn to weavers, quarries to stone cutters, excise contracts to todday tappers, etc. As ticket-distribution day neared, grand promises were made that a large proportion of the Congress tickets would be given to persons of the lower castes.

And simultaneously, upper caste leaders for the first time started acknowledging caste openly. They gave up the earlier pretence that they had been dominating politics by virtue of sheer merit. Brahmins held meetings at Vijayawada, Nellore and Hyderabad in which one demand was that they should be allotted the tickets to certain specified constituencies, as the brahmin population therein was sizeable. This is the kind of argument that in the past only Muslims, Christians or backward castes would have used, and would have been branded narrowly casteist or sectarian by brahmins. Kamma Congressmen who have always felt overwhelmed by the Reddys in that party held a meeting and resolved obliquely that all castes should be given tickets in proportion commensurate with their 'importance', which in their case means not only numbers but also economic power, of which they have plenty. And the Reddys took visible pains to explain away their embarrassing preponderance in the Congress. Thus bahujan politics had achieved the first victory that any rebel movement aspires for: to force the dominant groups to dump their myths and acknowledge the hidden aspects of reality.

Unfortunately, the opportunities opened up by these developments slipped away as elections neared, with the visible decline in the euphoria surrounding the BSP. The Congress and TDP leaders soon felt quite reassured, and not many more seats were allotted to the SCs and BCs than is usual.

And in N T Rama Rao's new cabinet, the number and the importance of the posts given to the SCs and BCs is not very different from the past. A beginning has, however, been made in the matter, and the future can witness more significant changes if the BSP leadership draws the requisite lessons from this experience.

III

And there was plenty of violence, too. Rayalaseema warlord gangsterism has in the last few years become a major topic of lament in Andhra Pradesh. One reason could be the legitimacy problems it creates for the rulers, especially in view of the democracy vs violence antithesis that dominates their discussion of naxalism. Another reason is the growing awareness of democracy and democratic rights among the people of Rayalaseema. A third reason is the growth of the gangsterism into a major cancer in recent years, with its transmutation into an instrument of money-making and political advancement. Violence, as a consequence, has accompanied all recent elections, as has the exhortation that the violence should be – and the promise that it will be – contained in the interests of democracy. This time round the fear of Seshan – of his arbitrariness rather than the legal authority of the Election Commission, of whose exact extent nobody including Seshan is clear – restrained the contenders somewhat, but nevertheless there was plenty of rigging, bomb throwing and killing. At Dhone in Kurnool district, from where Vijayabhaskar Reddy contested, all the village factions united to rig the polls in the then chief minister's favour, and there was none left to protest in the villages. Alampur in neighbouring Mahbubnagar district saw a triangular fight that held up electioneering in the faction-ridden area to the most ludicrous light. The Congress candidate was a recent convert from the Telugu Desam Party, and the Telugu Desam candidate conversely a recent convert from the Congress, both of them Reddy factionists from Kurnool district, transported to Mahbubnagar district as a solution to the impossible seat-distribution problem. The third candidate was the sitting BJP MLA, also a Reddy factionist, but a local man. As a local voter described the three in helpless humour, 'one makes bombs in his house, one on the terrace and one in the basement'. The three of them made such thorough nonsense of the polling process that the entire constituency had to have a repoll, certainly an unusual thing.

But an entirely humourless terror stalked northern Telangana this time. The obstinate attempt by the People's War Group (PWG) to obstruct the poll campaign at all cost, and the determination of the police to thwart this attempt equally at any cost led to a spate of violence in which more than 50 lives were

lost. Neither those who believe in electoral politics nor those who reject it would reckon it worth so many lives. The PWG asked the people to boycott the polls as usual, and also threatened the contesting candidates not to campaign, on pain of physical violence (they made an exception from this ban on campaign for the CPI (ML) candidates and the BSP candidates). Those campaigners who violated this rule had their vehicles burnt and their bones broken. The police moved in, not merely to protect the contestants from this violence, but also to defeat the PWG's political tactics and ensure that votes are polled in large numbers. This much has happened in past elections too. The ostensible purpose of the police has been to ensure that 'voters can vote freely and fearlessly', though it is a matter of common knowledge that while the PWG has violently prevented the contestants from exercising their legitimate right to campaign, it has not interfered with the people's right to vote, in case they choose to disobey the PWG and go and vote. But this time round, no bones were made about the real purpose of the police: they were not there to merely protect the contestants' right to campaign and the voters' right to vote, but to defeat the entire political effort of the PWG *vis-a-vis* the elections, no matter that it is no part of their job to do so. The police held meetings in village after village in which inspectors would openly threaten people that if they did not vote, their ration cards would be withdrawn, the electricity connection to the village would be cut and their children would be denied social welfare scholarships. It was certainly an odd way of giving confidence to voters who may wish to defy the PWG's direction.

To aid the AP police, a large number of CRPF and BSF men were dumped in the PWG-influenced districts. A particularly vicious and drunken lot of paramilitary commandos were brought from the Punjab and stationed in Karimnagar district, apparently because more terror must be inflicted to ensure that votes are polled in the prime minister's native district. The way these Punjab commandos behaved is testimony to what can happen if the police are allowed to develop into a lawless force in the name of suppressing political or social lawlessness. Drink and women were the principal interests of these commandos. They drank everything they could lay their hands on, pawed women in village lanes, raped a vegetable-seller in Ramagundam, and succeeded in driving women off the streets in panic wherever they were stationed. When the harassed people complained to the local police, those worthies who are usually a terror to everyone, expressed helplessness and suggested that the women keep to their homes until 'those fellows leave the district'. Not to be outdone, men of a CRPF platoon stationed at Kataram raped another woman,

a dalit labourer by name Salamma, who was however helped by press reporters to go to the district collector and superintendent of police and lodge a complaint. The administration ordered an enquiry by a woman IPS officer who managed to coerce the victim to say that she had not been raped by anyone but had got drunk and fallen, and then started eliciting the 'background' of the pressmen who had taken interest in the matter.

The strategy adopted by the police to defeat the PWG's intentions was to gather from each village youth known to be sympathisers of the PWG and hold them hostages from about a month prior to the day of polling. The implicit threat was that they would be objects of retaliatory killing if the PWG indulged in excessive violence. And these youth were also meant to be lined up before polling stations and compulsorily made to vote on polling day, as a demonstrative exhibition of the success of the police in defeating the intentions of the People's War Group. Not many people in this country would perhaps believe that about 3,000 youth were thus held like slaughter animals in police custody for the whole month of November. The PWG, for its part, as if to challenge the police to kill the hostages, senselessly landmined two vehicles carrying policemen and killed 16 persons including a few civilians, in the last week of November.

The first incident was at Lenkalagadda, an interior village of Karimnagar district, in which some Punjab commandos travelling in a tractor were blown up and killed along with the tractor driver and the local sub-inspector of police, and the second incident happened right near Warangal town, and on a state highway to boot, killing paramilitary men of the AP Special Police. The second landmine was apparently intended for the Congress government's municipal administration minister Madadi Narasimha Reddy, an old enemy of the PWG, but he escaped and a police escort vehicle was hit.

This macabre challenge was expectedly taken up by the police and there ensued a killing spree in which 35 persons were shot dead, 34 in Warangal and Karimnagar districts and one in Nizamabad district. Most of them were picked up from home or place of work in the full view and against the protests of their kith and kin and colleagues and shot dead within a few hours in some neighbouring village. Oddly enough the police did not kill any of the 3,000 suspected sympathisers already in their custody. That would not create enough of terror, and it is terror that the police want. So they went one step worse, and picked up youth who had not even been considered to have enough links with the PWG to merit prior detention and killed them. All the killings except one were the handiwork of the local police, the one exception being worthy of detailed

mention. The victim was a 45-year old dalit woman, Manthena Rajamma of Lakkepur in Karimnagar district, mother of five daughters and a son. On the afternoon of November 29 some Punjab commandos from Gajulapalli camp went to Lakkepur on a raid, searching for hidden naxalites or hidden ammunition. They were fully drunk on toddy and heavily armed with automatic weapons. When they approached Rajamma's house she tried to leave by a side door for she was alone in the house and was scared at the prospect of the search. But they spotted her and by signs asked her to come back. They entered the house and found one of the two rooms locked. They asked her to open it. As the terrified woman fumbled with the key for a minute, one of the impatient commandos aimed his gun at her and shot her right through her back. The bullet killed her, went through the locked door and emerged out of the other wall to lodge in the wall of the neighbour's house. The drunk commandos then went out telling the horrified villagers: 'buddi mar gayi'.

This killing went on till December 3, and polling in north Telangana was on December 5. On the previous evening the youth in custody were sent home to vote and get votes polled in their villages the next day, and come back again to report at the police station the day after polling. The implied threat again was that if not enough votes were polled, the youth could be killed. Indeed, the threat was not left implicit. It was stated bluntly. In any case, there was quite heavy polling in the north Telangana districts and all Congress heavy weights including the prime minister's son and his in-law lost massively. The losers themselves attributed their defeat at least in part to the methods adopted by the police (with their sanction, of course, though they would dishonestly put all the blame on the police after their defeat).

In the course of this blood bath, the main issue between the two armed contenders was left undecided: how many people would have voted, and how many would have boycotted the polls, if they had had peaceful conditions for the exercise of their choice? And in the interests of what great principle had so many lives been lost?

IV

The final question that remains is: What do elections signify in the new politico-economic consensus of the ruling classes? Economic liberalism does not render political power irrelevant, for what it nullifies is not governmental authority but governmental social responsibility. The Indian state of the 1990s is not a powerless political entity, not the ideal of 19th century liberalism. What it is freed from is only responsibility for the welfare of the people. The rest of its authority and responsibility is intact. And so it continues to be as profitable to be in the

business of politics as in the days of the licence-permit raj; perhaps more so, for lots of money is flowing into the country now both in the private and public sectors; and with 'globalisation' the stakes of all politico-economic activity is pushed up and computed in worthier currencies than the good old rupee.

Politicians' hunger for political office has therefore increased and not decreased, and the private wealth they have at their disposal has also increased with the multiplication of economic opportunities available to the propertied classes. They have therefore fought tooth and nail to get 'tickets' from winning parties and have used the most shameless means to get elected. It is trite to say that political morality has never been as low as this, for it gets lower and lower day by day and is always lower than it has ever been. And the contingent human imagination which (for all its pretensions to unlimited vision) is bound by experience and possible extrapolation believes on each day that it has sighted the nadir, but what it has seen is only the murkiest depths it can imagine, the nadir of its imaginative capabilities.

The norms laid down by Seshan to discipline campaigning and to limit campaign expenditure to legally permissible limits has meant reduced publicity expenditure for the candidates, which has actually hurt the newcomers like the BSP and parties like the CPI(M) groups which participate in elections, for wide publicity for their views, slogans and symbols is crucial for them rather than the Congress and TDP. For the latter the expense saved on this account has meant more to spend on unaccounted activity, such as the eleventh-hour distribution of cash and liquor which is a common feature of Indian elections. Votes were paid for at an unprecedented rate this time but whether they were successfully purchased is difficult to tell. In any case, the Telugu Desam Party is not 'yesterday's baby' (to borrow Seshan's memorable caveat about himself) and can spend as much as the Congress, and so it probably made no difference in the end.

But what elections mean for the voters in the new era is that this is one of the times they can put pressure to force the political system to be answerable to their needs, no matter that such answerability is called 'populism' these days. As the social responsibility of the government has been officially discarded, it must be enforced by the collective assertions of the people. One such possible moment of assertion is election time, when the threat of voting politicians out of power can help bend official policies. Perhaps it is the recognition of this possibility that has by a peculiar cognitive jump turned itself into an interpretation (only partially true) of the disastrous defeat of the Congress in the Andhra Pradesh elections this time.

Raitha Sangha's Political Dilemma

Kripa A P

The most surprising outcome of the Karnataka assembly elections was the dismal performance of the Karnataka Rajya Raitha Sangha. The reason for this may be its very approach to electoral politics.

THE outcome of the recently held Karnataka assembly elections surprised one and all. More surprising was the dismal performance by the Karnataka Rajya Raitha Sangha (KRRS), the state level farmers' organisation. Out of the 90 odd seats contested, the KRRS has been victorious in only one constituency (Pandavapura). Even more shocking was the fact that the two top leaders of the KRRS – M D Nanjundaswamy and Baba Gowda Patil – who are sitting MLAs, have been unable to retain their seats. The general performance of the KRRS has been very poor, with the number of votes being polled very low. The KRRS stronghold – Mandya district – has badly let down the organisation, with many of the local leaders faring poorly.

These developments are really surprising given the fact that since 1989 (previous election) the KRRS has had to deal with a number of issues which have kept it in the limelight. KRRS's handling of the Cauvery waters dispute and its stance on the removal of fertiliser subsidy had attracted the attention of the rural population. The KRRS was able to win the grudging respect of the urban population and even the politicians with its in-depth knowledge of the Dunkel proposals for GATT. In fact, the KRRS deserves credit for generating public, political as well as academic debate all over the country on the GATT proposals.

The reason behind KRRS's dismal electoral performance probably can be traced to its very approach to electoral politics. Since its inception KRRS's stance towards electoral politics has cost it dearly. The KRRS, formed in 1980, was essentially a non-party organisation. Subsequently when the assembly elections were announced in 1983, the KRRS decided to adopt a neutral stand. Not only did the KRRS forbid its members from standing for election, it also forbade them from participating in electioneering. This was widely opposed by a large section of the KRRS members, who felt that forbidding participation in elections was not a wise move. Further, they were keen on supporting the opposition alliance in order to defeat the Congress(I). The KRRS leaders were firm on this issue. They felt that entry into politics would weaken the movement. This apart, they had also felt that quicker results were possible through agitational politics. Further, they would not

need to have majority support to get these results. This uncompromising stance of the KRRS led to dissension within the movement. Consequently, a sizeable section of the KRRS members, particularly from Bellary and Dharwad districts, withdrew their membership from the organisation. Prominent among them were Revanasiddaiah from Bellary, and Sankrikoppa, Sidagantimat and Sangappa Uppin from Dharwad. This break-away faction decided to form a separate farmers' organisation, the Karnataka Ryota Karmikara Jagriti Samiti (Karnataka Farmers and Farm Workers Association) with C M Revanasiddaiah as its president and M S Sankrikoppa as its secretary. Both of them are Janata Dal loyalists. It is important to note here that just a few days before the 1983 elections owing to pressure from within and without, the KRRS gave a call to the farmers to overthrow the Gundu Rao government.

The agitational politics of the KRRS did not produce the same results with the then Janata government as it did with the previous government [Congress(I)]. It was felt that a neutral stand or boycotting elections was not really effective, as under the existing election law a certain minimum of votes relative to the size of the total electorate was not essential for a candidate's victory. Thus the KRRS decided to enter politics and fight its battles on the floor of the legislature. It was decided to field people's candidates as had been talked of during JP's time. The candidates are trained as legislators but do not have any affiliation to any of the existing political parties [Nanjundaswamy 1984]. The KRRS decided to test the waters with the 1984 Lok Sabha elections. The strategy was to field candidates independently without affiliation to political parties. The candidates were expected to continue their support to the KRRS and were cautioned against forging alliances with other political parties. The KRRS fielded seven candidates in opposition both to the Congress(I) and the Janata Dal [Nadkarni 1987]. The KRRS fared badly in the elections with all its candidates losing their deposits. Further, even in the 1985 assembly elections, the lone candidate fielded by them lost from Shimoga [Deccan Herald, April 12, 1989]. Thus, the KRRS's initial attempt at electoral politics was not successful.

However, the KRRS's decision to enter the formal political arena met with severe opposition from a section of the KRRS members, particularly from Hassan district. The Hassan faction had been against the KRRS's earlier decision to stay away from politics. They felt that to bring about any kind of change necessitated political power. They did not break away from the movement as they believed that while political power was essential, it came later in the process, after the organisation had consolidated its base. When the KRRS decided to enter politics, the Hassan faction along with some others argued that the KRRS should not contest elections on its own. To be effective as a political force it would have to combine with other progressive forces like the Dalit Sangharsha Samiti and Pragati Ranga to fight the elections. This was possible since all these forces had considerable agreement on ultimate goals. During this time, intense discussions and debates were carried out by the KRRS members on the need to form a 'third force' in Karnataka. A section of the KRRS, particularly the Hassan group, insisted that the KRRS on its own would not be effective as a political party as it would be representing the interests of only one section of society. A political party would be required to balance the interests of all sections of society. It was for this reason that they were opposed to the name 'Kannada Desha', under which the KRRS was planning to contest elections, as it would be limiting in its scope. The KRRS contesting elections on its own would not only alienate the poorer sections of the urban sector, it would also create an imbalance by representing only a particular section of the society. The KRRS as an organisation was limited in its spread, and hence as a political party it would just end up dividing the votes. Thus, this faction strongly favoured an alliance of all radical groups to fight elections [Venkatesh Murthy 1992].

The KRRS leaders, on the other hand, were against such a move. The Hassan faction was suspected to have close ties with Deve Gowda. Their apprehension was that formation of a third force with other progressive organisations would entail compromises. It was also alleged that, attracted by quick results, these members had gotten onto the payroll of different political parties and individuals like Deve Gowda. Whatever the reasons, the difference of opinion regarding KRRS's entry into politics and the formation of a third force finally resulted in the KRRS expelling nearly 17 members from the organisation [Indian Express, July 23, 1989]. This dissension proved costly for the KRRS as it completely lost Hassan district which was once a stronghold. The KRRS, which went ahead with its political strategy of contesting the 1989 assembly elections, fared a little better

than in the earlier attempts. Baba Gowda Patil, contesting from Kittur and Dharwad (rural), was the only successful candidate, winning from both the constituencies. While he retained the Kittur seat, the KRRS successfully fielded their second candidate, Nanjundaswamy, during the by-elections from Dharwad (rural). However, once again the KRRS was unable to prove politically weighty in its strongholds, namely, Shimoga and Mandya. While the KRRS claimed to be satisfied with its performances, speculating on its political future, critics thought otherwise.

The KRRS's decision to contest in the 1991 parliamentary elections was not received favourably by the rural population. The feeling was that the KRRS should first consolidate its position at the state level, recover its lost ground and strengthen its base. In fact, this has been the general opinion of the majority of the rural population towards KRRS's entry into politics. KRRS is preferred as an organisation, a lobby, without political leanings. A common fear is that once KRRS gets into politics, it would become corrupt just like other political parties.

To a certain extent the voting pattern in the recent elections indicates that these apprehensions have come true. While the reasons behind the poor electoral performance of the KRRS are debatable, it is irrefutable that the neglect of local units and lack of commitment towards constructive work at the grass roots level have acted as contributory factors. Explaining the KRRS's poor performance Nanjundaswamy, president of KRRS, felt that the "BJP factor had cut into the 'gullible' Hindu votes and forced the minorities to change their loyalty from Congress to the other national party which might come to power" (interview Dec 24, 1994, Bangalore).

Interestingly both the sitting MLAs were defeated by Congress(I) candidates rather than BJP or JD candidates. According to Nanjundaswamy, a concerted effort was made both in Kittur and Dharwad (rural) constituencies by the Congress(I) to defeat the KRRS leaders. He feels that issues or policy matters are not taken into consideration by the electorate while voting, and this time caste played an important role.

Whatever reasons to which the KRRS might attribute its dismal performance, it can no longer ignore the fact that it might have a better appeal as an organisation and a lobby rather than as a political party. In fact, at the executive committee meeting at Bangalore (after the elections) the KRRS has taken a decision to directly approach its members and seek their opinion on whether the KRRS should contest in the forthcoming panchayat elections. Taluk units have been pulled up for their neglect of local units. According to Nanjundaswamy, KRRS's involvement with electoral politics would continue, as it wants to educate the rural electorate regarding the political process

and work towards 'cleansing' the electoral process which has become corrupt.

However, the political defeat has not deterred the organisation from its work. In fact, plans are being made to resume its fight against the new economic policies. The KRRS has been seriously considering joining hands with INTUC in fighting against economic liberalisation. KRRS with the help of third world network plans to set up an international research institute on sustainable agricultural development. Special efforts are being made to set up a seed supply system which will not only function as a seed bank but also include production of indigenous seeds - KRRS's reply to GATT!

Thus a look at the political journey of the KRRS shows more downs than ups. Apart from a modest success in the 1988 elections (when the KRRS won two seats), its other ventures into electoral politics have been unproductive. In fact KRRS has had better success as a lobby, particularly in dealing with price issues. If electoral performance is any indicator, the response of the rural population seems negative towards KRRS's entry into politics. Time and again the rural population has come out with the same verdict - that they clearly prefer KRRS as a lobby than as a political party.

It is obvious that the KRRS has found itself in a quandary in relation to entry into politics. Leaving aside their claim that they wish to 'cleanse' the leaders, possibly they embarked

upon formal politics lest they should be totally marginalised. They cannot but be aware that to succeed as a political force the base of support will have to expand. Such expansion will necessarily mean a dilution in terms of the movement's orientation. The precedent of Narayanaswamy Naidu's Tamil Nadu Agriculturists' Association (TNAA) attempting a political career is not heartening. Further, given the reservations of the farmers themselves, KRRS might well encounter severe problems.

The KRRS might do better by limiting its political ambitions to securing representation in local government and the state legislature adequate to enable it to articulate the interests of farmers while not aspiring to political power. Disavowal of political ambitions such as capturing state power may enable the KRRS to carry conviction with its principal supporters. The KRRS was able to mobilise massive support for their attack against the multinational company, Cargill. The paradox is that it has been unable to translate that support into votes. Obviously, the rural population prefers KRRS as a representative platform to air their grievances rather than as a formal political party.

OUTSTANDING BOOKS

MODERN LIBRARY SCIENCE SERIES

DEVELOPMENT OF LIBRARY AND INFORMATION SCIENCE

Edited by Inder Mohan Goswami

This book is intended for any student who is expected to study the social background.
1995 ISBN 81-7169-327-X Rs 495.

RESEARCH METHODOLOGY IN LIBRARY SCIENCE

Edited by Inder Mohan Goswami

This volume is intended for use by the individual who is attempting to better understand how research provides the capacity for a field to move forward.
1995 ISBN 81-7169-329-6 Rs 500.

CLASSIFICATION OF LIBRARY SCIENCE

Edited by Inder Mohan Goswami

Deals with the Provisions of library Service of Classification and referencing in a Comprehensive way
1995 ISBN 81-7169-325-3 Rs 475

MANUAL OF LIBRARY CATALOGUING

Edited by Inder Mohan Goswami

Discusses the role of Cataloguing Services in relation to other library Services.
1995 ISBN 81-7169-328-8 Rs 475.

MANAGEMENT OF LIBRARY ADMINISTRATION

Edited by Inder Mohan Goswami

This book deals with the management techniques in library science and discusses the role of libraries and librarians in the field public education.
1995 ISBN 81-7169-326-1 Rs 495.

A Modest 'Giant'

Nirmal Sengupta

Despite his national and international stature, Malcom Adiseshiah, who passed away in Madras on November 21, 1994, retained a very local identity.

FOR about a half the days in the month Malcolm Adiseshiah would be out of Madras attending meetings and conferences. But when he was here his car would enter the Madras Institute of Development Studies (MIDS) exactly at the same time, around 10.30. He would be seated in his chair and would be working at a frantic speed till 2.30 in the afternoon reading, writing, talking to visitors. Rarely did we see him in person outside a scheduled meeting. But his presence was always felt. The *Bulletin* edited by him would reach our desks every month in time. He would be there attending most of the seminars and workshops invariably making some useful observations. And though the in-house chairman was extremely reluctant to get involved in day-to-day matters, being totally averse to any sort of interference, he would conduct his chairman's duties absolutely thoroughly. So when the car stopped coming and the room remained locked everyone at MIDS felt his absence. Precisely it was the same to many others in Madras, in the state, and outside the state although their points of contact with him were strictly business. Malcolm Adiseshiah is to be remembered by his work and the way he conducted it.

His father was a professor of philosophy and principal of a college at Vellore, near Madras. His mother was an active social worker and was the first woman councillor of the local municipality. Malcolm Sathianathan Adiseshiah was their second son born on April 18, 1910. He received his education at Vellore, Madras and London, began his career in Calcutta, was then in Madras Christian College, moved to Geneva and then joined the UNESCO in 1948. He served the UNESCO for 22 years and was deputy director general for the last eight years of his career. After retirement he returned to Madras in 1970 and established the MIDS. He had also agreed to serve as vice-chancellor of Madras university in 1975 and was in office for three years until he was nominated to Rajya Sabha.

Malcolm Adiseshiah received his PhD in economics from London School of Economics. Just for the record, later, he was conferred honorary doctorates by 15 universities, was decorated by 40 countries and was awarded Padma Bhushan in 1976. As an academic he was unconventional even at that early stage. At Madras Christian

College he had introduced Keynesian economics in the early 40s when most others were not even aware of its significance. Simultaneously, he had started a Rural Service League to acquaint the students with the economic reality. Till the end he worked in applied economics. Two of his regular contributions – a mid-year review of the national economy and a critique of the Tamil Nadu government's Economic Appraisals – were unique summary accounts and were widely read. He had an interest in many other subjects, particularly in environmental issues. His greatest contribution however was as an educationist. Adiseshiah was instrumental in setting up a curriculum for primary, secondary and collegiate education, examination reform, reform of university administration, development of social science studies, vocationalisation, introduction of science and technology at appropriate levels, promoting interdisciplinary research, non-formal education, continuing education and improvement of educational data. He was the chief architect of the adult literacy programme of UNESCO. The list of institutions he was associated with included International Council for Adult Education, International Institute for Educational Planning, International Literacy Jury, National Literacy Mission, National Council of Educational Research and Training, Tamil Nadu Board of Continuing Education, Tamil Nadu State Council for Science and Technology, Centre for Development Studies, Trivandrum, Tata Institute of Social Sciences, Bombay and Council for Social Development, Delhi. He was also one of the founders of the India International Centre.

The administrative and organisational capabilities of Malcolm Adiseshiah were phenomenal. For example, during his three-year term as vice-chancellor of Madras university he decentralised its functions, gave autonomy to selected colleges, implemented UGC scales of pay, inaugurated a housing scheme for employees, added several new departments, started semester system of examination, initiated orientation courses for teachers and introduced community service scheme into the curriculum. For each of the innumerable meetings he had to attend he always read minutely all the related papers. If he referred to page numbers and lines of a document – which he very often did – that

was never from a cursory glance. If presiding over a meeting or a seminar, he would sum up the proceedings so accurately that no one would suggest any alteration. Like most successful administrators he never missed a point and was quick to make decisions. But unlike many of them he was also respectful of the offices of his juniors. The air-conditioner in his room was removed to equip the room housing the newly-acquired computer at MIDS. Sometimes there would not be substitutes if personnel to assist him were on leave. Telephones failed, careless visitors would talk loudly outside his room – he would bear with almost every inconvenience. The ultimate step was to request the administrative head, the director, if something could be done. Everyone who came in touch with Adiseshiah was impressed by this rare example of modesty. Every visitor on work, whatever may be his or her position, got VIP treatment from him; but anyone without a legitimate reason to visit would be coolly shrugged off. The last aspect helped him to remain a voracious reader.

In spite of his national and international stature Malcolm Adiseshiah retained a very local identity. He was overtly a Tamilian in his lifestyle. He would come to MIDS dressed in the local way. He loved to speak and write in Tamil. He promoted the Tamil language in various ways like setting up the International Institute of Tamil Studies and by commissioning a translation of the Tamil classic *Thirukkural*. If occasion demanded it he would not hesitate to declare that he was a devoted Christian. He was closely associated with several Christian social work organisations and institutes. His acquaintances of that period say that he was very much an Indian while in UNESCO. In his official capacity he had channelised substantial UNESCO Technical Assistance Programme funds to India. But Adiseshiah never faced any charge of being parochial. No one of a different language, religion or country had ever received biased treatment from him. Never was he associated with any organisation promoting divisiveness. In these days of religious, ethnic and national conflicts, when local and sectoral identities tend to become liabilities, Malcolm Adiseshiah personified a successful way of combining the two.

After retirement someone as affluent as he could have rested on his laurels. Not Adiseshiah. He started MIDS in one of his properties. When in 1978 it was reconstituted as a national institute, Adiseshiah and his wife donated to it land, a building and a considerable sum of money as endowment. He was more of a missionary. His tastes were simple. He wanted to be sure that his mission would go on and left a major part of his savings for promoting research in the social sciences.

Security of the South in Emerging International System

Amit Gupta

How can the countries of the south enhance their external security, given that the west views the south as a threat? To answer this question, this article examines the western conception of security in the new world order and analyses the west's capability to enforce its vision. It goes on to analyse the military capability of the south and the south's options in the emerging international system.

HOW can the countries of the south enhance their external security in the emerging international system? The question is particularly important since the west now seems to view the south as a threat which needs to be militarily and politically countered. President Clinton stated at the UN in September 1993 that nonproliferation would be a priority of his administration's foreign policy. More specifically, the Pentagon is restructuring its forces and doctrine under its counterproliferation policy to combat a nuclear armed southern state. The Clinton administration's national security advisor, Anthony Lake, in a recent article has branded several southern states as 'backlash states' – states which want to stay outside the new family of democratic, free-market nations – and has called for their containment.¹ If the west's attitude is to view the south as a threat, and to develop military and political strategies to neutralise it, how should the south respond to this new policy? To answer this question, this article first examines what is the western conception of security in the emerging international system. Second, it analyses the west's capability to enforce such a vision. Third, it analyses the nature of the military capability of the south countries. Finally, it discusses what sort of options this provides in a new international system.

ATTITUDE OF THE WEST

The attitude of the west is based on a number of factors, the most important of which is its proven military superiority. The Gulf war showed that despite the major advances made by the south in weapons production, the west – particularly the US – had the capability to prevail in a set-piece conventional battle. This conventional superiority is unlikely to change in the coming decades since no single southern country, or even collection of countries, has the necessary scientific base or financial resources to build up a conventional military machine.

It was this proven military superiority which led to the hope after the Gulf war that a 'New World Order' could be created. In this world order the hitherto defunct concept of collective security – under the aegis of the UN – was to be revived to maintain peace

and international security. Military superiority and the new consensus among the western powers, it was believed, could rejuvenate a mission which the UN had virtually given up after the Korean war. But in translating this military superiority into political power, the west, especially the US, was being even more ambitious than the great powers which had sat down at Dumbarton Oaks to construct the UN Charter. Not only was collective security and peacekeeping going to be the agenda of the new US-led UN, it was also going to take on a new task – peacemaking. Under the rubric of peacemaking, the military preponderance of the US-led western coalition was to be used for such ambitious tasks as trying to rebuild a Somali nation and restoring democracy in Haiti. Military power, therefore, was going beyond the conquest of territory, or the deterrence of aggression, to the actual reshaping of societies – again something which had not been successfully achieved since the 1940s by the US in Germany and Japan and by the former Soviet Union in eastern Europe.

Western attitudes towards the south were also shaped by the belief that there was now a consensus in the 'New West'. The west in the post-cold war era is seen as being one civilisation, encompassing eastern Europe and the European states of the former Soviet Union.² These nations temporarily had a consensus on such issues as the sale of arms to the south, and on co-operation in the UN on international security issues. This consensus was supposed to make the UN into a viable instrument for enforcing western will and to facilitate drawing together military capabilities to enforce order in the south.

Third, while attitudes towards the former communist nations have changed they still remain the same where the south is concerned. In the cold war era, the south was seen as being poor, unstable, heavily militarised. Now the south is still considered poor, unstable and heavily militarised. Due to such an attitude no serious attempt has been made to bring southern countries into the emerging security framework. President Bush used to talk about 'partners in leadership', meaning the US, Germany and Japan. President Clinton has pushed through the North American Free

Trade Agreement and the Asia-Pacific Economic Commission. But all this really boils down to is a search for markets. No real attempt has been made to bring south countries in as partners in a common security framework. Brazil, India, Israel and South Korea, for instance, are not included as partners in this new security framework.

What follows from such attitudes is that the west is seeking to militarily defang the south and impose political solutions on it which are seen as being conducive to the 'New World Order'. Thus General Aidid was declared a thug and a criminal in Somalia, and the Clinton administration continues to try to bring back prime minister Aristide to power in Haiti.

Militarily, the primary concerns are to halt the spread of weapons of mass destruction and the means to deliver them (nuclear, biological and chemical weapons and ballistic missile delivery systems). This includes setting up force structures to actually fight in conflicts where such weapons are used, and further, to create a western military force which can be used for peacekeeping and peacemaking missions. The US has been seeking to develop ties with both Russia and now, it seems, China – which is the one southern state to be solicited for this purpose.

CONSTRAINTS

Yet while the general post-Gulf war attitude has been to establish an international order – by either the use or show of force – it has not worked because of a number of constraints. Money is a major constraint. At a time when most nations in the west, particularly the US and Russia, are faced with budgetary pressures, it is difficult to find financial resources to fund a major war effort like the Gulf war. The US had to pass the hat around in order to get the money to fund the Gulf war. While the western nations were willing to contribute to that effort because of the threat to world energy supplies, they may not be willing to contribute large amounts for future conflicts in the world. The reason for this reluctance is that the western consensus is breaking down.

The western consensus is breaking down both on the use of force and on who are the precise members of the western alliance itself. To answer the latter question first, the 'New West' was conceived as including both eastern Europe and the European parts of the former Soviet Union under one civilisational package. In fact there are three wests: the US, western Europe and eastern Europe/former European Soviets. Each of these, however, has different views on the utility of force in the new international system. The west Europeans are less than enthusiastic about playing the international policeman, and certainly not willing to make major financial or human commitments to do this. West European reluctance to get involved in the Yugoslavian civil war without an American

commitment is an example of this. The Russians and east Europeans are so strapped for finances that they will find it difficult to regularly send military contingents abroad for peacekeeping and peacemaking duties. Further, the Russians are seeing a nationalistic revival which is creating a break in the consensus. Nationalist groups in Russia like Zhirinovskiy's are arguing that Russia should play a more active role in international affairs in order to regain its lost standing as a major power. This has led to a Russian push to increase arms sales to the south. It has also led Boris Yeltsin to declare in the UN Security Council that Russia would vote against greater economic sanctions against Libya. It may also see the Russians fomenting civil unrest in the former republics of the Soviet Union. In fact, as Alexei Arbatov points out, there is already a move in the west to give Russia a free hand in dealing with the former republics, with the possible exception of the Baltics. If this happens the Russians will be so preoccupied with events in their own backyard that it will be difficult for them to commit troops elsewhere.

A related constraint is the will to fight. It is becoming increasingly difficult to motivate people to go overseas and fight in wars which do not involve the vital interests of the western nations. A number of west European nations have opposed committing troops beyond the confines of Europe. In the US there is still a will to fight but only under specific conditions: that there be a clear-cut mission; that it end quickly and that it involve a low loss of life. These conditions are particularly important given the changing composition of the US armed forces. Close to 30 per cent of the US armed forces are minorities and, increasingly, the well-to-do are not entering the military. Thus the US national security system is being shaped along class lines. Those making the decisions and sending young Americans out to fight are the well-to-do who themselves have not seen combat – Clinton and Quayle. Nor will their children. Those actually dying in different parts of the world are either minorities or less well-to-do whites. As John Lewis Gaddis points out, "Resentment over this pattern – when it develops – is likely to undermine whatever foreign policy consensus may yet remain".

If such constraints exist, under what situations could western force be mobilised and used? Three types of mission may drive western intervention in the south: the resource mission, the peacemaking mission, and the punitive mission. The resource mission is to counter threats to natural resources which are badly needed by the west and fluctuations in the supply of which could hurt western economies. At present oil seems to be the only major natural resource which falls in this category. This is also the one mission for which the western nations are most likely to agree that military action needs to be taken and will, therefore, provide both the monetary resources and personnel to carry it out.

The peacemaking mission combines humanitarian assistance – as in the case of Bosnia and Somalia – and the attempt to bring about a peaceful and just society in a country – as in Haiti and Somalia. In the initial euphoria of a changed international system, it was assumed that western nations, through the UN, would be able to create strong governments which supported democracy in the south and in the former communist world. The justification for such a mission came from the increasing number of nations which started moving towards a process which has been called either the 'third' or 'fourth wave of democracy' – in which significant numbers of nations start the transition to democracy.⁴

The problem with this approach was that it underestimated the costs of peacemaking. Putting troops into a civil war or internal anarchy situation is not a short-term process, even if the troops have an overwhelming military preponderance. Such a process involves establishing workable governments – Lebanon, Haiti – and in some cases, restoring civil society – Uganda, Somalia. These are long-term processes which require a continued military presence. This was the case with the American military occupation of West Germany and Japan after the second world war. In both cases, the US went through a lengthy process of military occupation: it demilitarised these societies, eradicated the institutions of fascism, and laid the foundations for democracy. Such a reshaping of societies was possible because these nations had lost the war, were occupied, and could not aggressively challenge the occupation by the allied powers. Further, the cold war demanded a long-term military and economic commitment to Germany and Japan.

Few of the conditions which facilitated the democratisation of Germany and Japan in the 1940s and 1950s apply in the 'New World Order'. The US and the rest of the west do not have the military will and economic capability to enforce democratic systems in the south. Unlike Germany and Japan, there has been aggressive resistance to the western efforts to impose civil societies and governmental structures in the south. Lebanon in the 1980s and Somalia in the last couple of years are examples of this. Peacemaking in such situations requires the willingness to take casualties in order to enforce a particular governmental system.

This willingness is severely circumscribed by western public opinion's distaste for casualties and is heightened by the media. In the last few years European public opinion has been against extra-regional military intervention. American public opinion has been more complex. While the average American supports the external use of military force, he/she would like such intervention to have a finite timetable and lead to very low casualty rates. The Pentagon has recognised these opinions and in the Gulf war imposed military censorship to ensure

that the wrong type of press coverage did not take place. There was also the drive to bring the Gulf war to a swift conclusion and bring the 'boys and girls' home. Censorship and swift conclusions, however, are not possible in peacemaking situations. Being a more long-term commitment it is difficult to prevent independent coverage of events within a society. It was difficult to censor media coverage in the Congo and Vietnam in the 60s, just as it has been impossible to halt media coverage in Lebanon in the 80s, and in Somalia and Haiti in the 90s. In fact when the US special forces landed on the beach in Somalia there were more reporters there than soldiers. Thus once casualty rates start going up and the media highlights it, there is a discernible drop in public support for such operations and a clamouring to bring the boys and girls back home.

Peacemaking, therefore, is the least likely area in which the west is willing to use force in the south. Yet situations requiring peacemaking are on the increase around the world. The breakup of multi-ethnic states and the increase in civil wars create the need for multinational peacekeeping and peacemaking forces. Such forces, however, are unlikely to come for the reasons mentioned above. Thus in the one area where intervention is needed it will be least available.

PUNITIVE MISSION

The punitive mission will be aimed against terrorist groups, guerrilla movements, and 'backlash' states. Of these three groups the 'backlash' states need to be discussed because attacks against them could lead to a full-scale war. One of the fallouts of the Gulf war was the belief that in future no militarised southern state would be allowed to become a threat to international peace and security. Such states would be branded as rogue states, isolated in the international community, and be militarily neutralised. Iraq was the first rogue state to be neutralised and North Korea could possibly be the next one. In such a case the west need not act in union, since the US's military capability would be sufficient to prevail. Consensus, therefore, would appear not to be a problem. Neither, it is believed, would there be a need for a prolonged military involvement, or for a long-term troop commitment. In the case of North Korea, for example, there could be a massive air strike against its known nuclear facilities. President Clinton has also obliquely threatened to respond with nuclear weaponry against the Kim Il Sung regime if it were to initiate the use of nuclear weaponry. Where does the south stand against such attempts at intervention? To answer this question it is necessary to look at the current state, of southern military capability.

SOUTH'S MILITARY CAPABILITY

During the 1980s there was a general upgrade in the quality of weapons produced

by southern countries – especially in countries that had extensive scientific-industrial bases such as Brazil, India, South Korea and Israel. Thus 26 countries had ongoing missile programmes and at least four were developing combat aircraft (Israel, India, Taiwan, and South Africa). Other systems put into production included ships, tanks and guided missiles (India, Israel, and Brazil). Brazil and India also initiated programmes for the construction of nuclear-powered submarines. Coupled with the development of such systems was the growing capability of southern countries to produce weapons of mass destruction: Libya and Iraq produced chemical weapons; North Korea and Pakistan embarked on nuclear programmes.

By the start of the 1990s, however, the attempt by southern countries to advance to a higher technological level met with mixed success. On the production side, most were able to expand the range of systems they produced and upgrade the quality of those systems. Certain southern states were also able to make advances in the production of electronic subsystems – Israel and Singapore being the most prominent examples. But when it came to developing state-of-the-art conventional weapons, the track record was far less successful. A number of programmes were either terminated or pushed to the point of becoming uneconomical because of high development costs, technology restrictions, and internal pressures. The most complete programme to develop a supersonic fighter was Israel's Lavi fighter, but this was scrapped in 1987 owing to the escalating costs and pressure from American aerospace firms, who saw the plane cutting into their market. India's Light Combat Aircraft, similarly, may end up as a technology demonstrator, while Taiwan's fighter aircraft programme may be shelved due to the recent import of high quality American and French aircraft.

Where the countries of the south succeeded was in the production of low to medium tech weaponry – subsonic aircraft, armoured personnel carriers, field guns and certain types of naval vessels – and, paradoxically, in the development of weapons of mass destruction.

Southern countries were able to produce nuclear and chemical weapons, as well as ballistic missiles which could be used to deliver them. The reason these countries were able to acquire such weaponry lay in the vintage of these technologies: nuclear weapons are 50-year old technology; chemical weapons date back to first world war; and ballistic missiles were first used in second world war. Yet despite their vintage these weapons are not obsolescent and kill just as effectively as they did half a century ago. Thus, the southern nations were able to develop these weapons even while failing to produce more advanced conventional technology.

How does the south's military capability position it to deal with the west in a new

international system? First, it should be acknowledged that the south's conventional military capability has not developed to the extent it was hoped that the modernisation efforts of the 1980s would allow. Thus, in a large-scale conventional conflict a southern country, if lucky, could bloody the nose of a western power, as Argentina did to Britain in the Falklands war. In the end, however, the western nation would most likely prevail – especially if it were either the US or Russia. This would seem to put constraints on the use of force by the rising middle powers of the south like India, Brazil and Israel.

But the lack of conventional capability is made up for by the existence of weapons of mass destruction in these countries' arsenals. The possession of nuclear, biological and chemical (NBC) weapons pose a deterrent to the use of western force because they severely raise the costs of intervention. Former secretary of defence Les Aspin acknowledged this fact in a public speech when he declared that, "Weapons of mass destruction may threaten our forces in the field, and in a more subtle way threaten the effective use of those forces." Zhignew Brzezinski put it more bluntly when he wrote that the existence of weapons of mass destruction in unstable nations of the world would dissuade western public opinion from intervening in conflicts in these regions. The crucial problem for the west here would be the willingness to bear casualties. If dragging a dead soldier through the streets of Mogadishu can trigger a timetable for withdrawal, the death of large numbers of US troops in a confrontation would dampen enthusiasm for such military actions in the future.

Not only will the western powers be dissuaded from intervening because of public opinion, but the actual use of such weapons in the field of conflict could have devastating effects for the very allies that the west seeks to protect by intervening. In a North Korea-South Korea conflict, the use of a nuclear weapon by the north over the south would not only kill American troops but also devastate parts of South Korea. Similarly, if a southern nation were to use biological weapons in its opponent's territory, it would make the land uninhabitable for an entire generation. Britain tested biological weapons on Guinard Island during the second world war, and the island remained uninhabitable till the mid-1980s. Destroying an ally you seek to save is not the ideal political outcome.

What the west sees as its primary threat, therefore, is not the acquisition of an offensive capability by the south. The acquisition of weapons of mass destruction is not going to alter the global military balance. The US and Russia will remain the principal nuclear powers. China, France, Britain and possibly Ukraine will be second tier nuclear powers, and the nations of the south will be a distant third. It is a threat in a negative sense because it restricts western interventionary capability.

Consequently, it will constrain the west's ability to create its notion of a 'New World Order'. It is in order to counter this potential threat that nations like the US are reconfiguring their armed forces to deal with the challenge posed by the south. What then can the nations of the south do to strengthen their security?

One approach would be to accept the west's demands for arms control and eventual disarmament on western terms. This would involve the four remaining nuclear capable nations in the south – India, Pakistan, Israel and North Korea – giving up their nuclear options and signing the NPT. It would also involve placing limits on conventional weapons programmes and the sale of weaponry to other nations. The problem with this approach is two-fold. At the more obvious level, it would leave regional conflicts unresolved and at the same time remove the security which weapons of mass destruction provide to the nations locked in these enduring regional rivalries. At a more fundamental level, it condemns the nations of the south to a second-class status in the emerging international system.

As bipolarity ended, the debate in the north shifted to one of just how dangerous a multipolar system was. Bipolarity was seen as having introduced systemic stability while multipolarity was seen as causing instability because the increased number of major powers meant a greater chance of conflict. The real issue, however, was not the relative merits of bipolarity and multipolarity in creating systemic stability, but what were the underlying assumptions behind the new multipolarity. Here, sadly, the discussion rested on the assumption that multipolarity meant a return to the classic multipolar systems of western Europe. Thus Mearsheimer, for instance, used examples from past European systems to show how unstable multipolarity was.

What should have been discussed, instead, was whether multipolarity created a new world order. Classical multipolarity was marked by colonialism spheres of influence, lack of self-determination, economic rapaciousness and a scant regard for human rights. Further, the have-nots of the system were pawns whose territories could be carved up to suit the demands of systemic stability. The 1884 Congress of Berlin, in which Africa was carved up over a conference table, is a case in point. The post-cold war literature does not question these characteristics of multipolarity. Mearsheimer is worried about stability, Krauthammer about whether multipolarity has actually come about or whether the US is still the only superpower. Nye, while rejecting these conceptions of world order, makes the same mistake of concentrating on the great powers. He argues, for example, that the new order is marked by transnational interdependence which leads to a diffusion of power. Nye supports his argument by giving, among others, the

example of how private actors in the global capital markets constrain the way interest rates can be used to manage the US economy.¹⁰ Such interdependence, however, only exists among the major powers – Brazilians, Fijians and Rwandans do not constrain US interest rates – so Nye too ends up discussing a great power-centric international system. Since this attitude of the west is not going to change it does not make sense for the nations of the south to give up their last bargaining chip. The fact is that the new international system looks very much the same from the south – by the big powers, for the big powers, of the big powers. In this system the west views the south's military capability as a threat to international order.

If capitulation has its dangers so does belligerence. The American response to the limited success of nonproliferation efforts has been to develop a counterproliferation policy, whereby, force structures will be developed to counter the proliferation threat. Such a policy is not in the interests of either the west or the south, it would turn the south into a battleground which is devastated by weapons of mass destruction; it could also lead to large-scale casualties in western forces.

Second, much of the proliferation literature emerging from the south in the heyday of the cold war on weapons of mass destruction focused on providing a rationale for the south's possession of such weapons.¹¹ These arguments usually included the existence of genuine security threats, the lack of guarantees from the major powers, and the lack of progress by the major powers in the area of disarmament. Basically this debate was adversarial in nature since it saw the south staving off the west's nonproliferation efforts. With the cold war dead the south needs to discuss its capability in a new context.

THE SOUTH'S OPTIONS

The middle powers of the south need to recognise that the end of bipolarity has provided the means to restructure the international system so that the south has a great say in international outcomes. Part of the early Indian debate, for instance, concerned what kind of role a nuclear India would play in a international system. At that point of time some Indian scholars argued that Indian possession of nuclear weapons would most likely lead that country to become a status quoist power within the international system.¹² The middle powers of the south need to make the same argument now. Most southern nations which still have nuclear programmes have stakes in the continuation of the present international order because of the growing economic linkages around the world. Israel, India, Pakistan, and even North Korea, all need western economic assistance and more importantly, investments, to continue to transform their economies.

Further, the death of the cold war resolves some of the early concerns of the non-aligned

movement: the prospects of a global Armageddon are now negligible; the US and the former Soviet Union states are reducing their nuclear arsenals; and most of the nations of the world – developed and underdeveloped – are concerned about the fate of their economies. Indeed, Jawaharlal Nehru saw future global security lying in such a shift of emphasis. What the south needs to do, therefore, is to prevent western attention from being diverted to future militarisation, yet at the same time retain its capability for self-defence. It is in this context that declaring oneself a status quoist power makes sense.

Becoming a status quoist nation does not mean disarmament. Instead, it requires taking initiatives which convince the major powers that the middle powers of the south are willing to preserve certain common security norms. One such proposal could entail a southern guarantee to prevent the transfer of weapons of mass destruction and the technologies associated with it. Such a step does not endanger the security of southern states and instead fits into the ongoing policies of some of the southern states. While Brazil, China and North Korea in the 1980s were willing to transfer missile technology to Middle Eastern nations, India in the 1980s, according to V Arunachalam, then director of defence research and development, turned down \$ 200 million worth of sales to Iraq. Pakistan, similarly, despite its rhetoric about the 'Islamic Bomb', refused to transfer nuclear technology to Libya. Such a guarantee would not really harm southern interests yet at the same time would assuage western fears about the proliferation of weaponry.

Second, southern states have to come up with their own proposals for peacekeeping forces. The need for such missions is becoming all the more widespread, even as the western powers are weakening in their will to carry out such missions. Southern states could earmark military units within their armed forces for deployment around the world. These nations could also specify in what situations and what geographic regions they are willing to allow their forces to serve. Another aspect of such a policy is that it would shift the debate on the use of such force from the great power-dominated Security Council to the more democratic General Assembly. Repeated use of the UN General Assembly for proposing such operations would increase the effectiveness and the democratic nature of that international organisation.

A third step would be to collaborate with the arms industries of the northern countries to build new weapons systems. The major cutbacks in northern defence spending have left these nations' arms industries struggling to find new markets. At the same time, southern arms industries have run into bottlenecks while trying to produce new systems. If the southern states were to actively seek collaboration it would create an interdependence in the arms market which

would have favourable implications for both the north and the south. The north would benefit in terms of higher employment levels and the survival of key industries. The south would acquire new systems. More importantly, such collaboration would create linkages which would stress the value of the south to the north. Israel, for instance, is already pursuing such a strategy.

In conclusion the security of the south lies in trying to create a meaningful role for itself in international affairs – a role which breaks the outdated conception of multipolarity and shifts it towards a more democratic international system. Tough bargaining and the willingness to work with the major powers is the first step in this process.

Turning Health Into an Investment

Assaults on Third World Health Care

David Werner

Too often high-level health and development planners get so absorbed in the macro issues of health economics that they lose sight of the micro issues. Little research has been done to examine the extent to which the money poor families spend on health care affects their nutritional status, and thereby their health and survival, particularly of women and children. Yet these questions are crucial especially in the context of the current assault on health care unleashed by the west.

IN spite of the acclaimed goal of health for all, in recent years formal health services have become increasingly inaccessible to the growing numbers of destitute people. The reason largely economic. At the same time that poverty is deepening in many nations, rich and poor, the costs for basic health care are being systematically shifted from the public sector to the individual consumer.

Since the early 1980s the income gap between rich and poor has been widening between countries and within them. Today over one billion persons – one in five of the world's people – try to survive on less than one dollar per day.¹ In many countries, minimum wages have fallen so low that they do not cover the family's basic food needs. On a recent visit to Bolivia, I was told it now takes seven official minimum wages to adequately feed a family of five. No wonder a lot of Bolivians grow coca – or chew it to stave off hunger. And no wonder over half of Bolivia's children show signs of stunting.² Too often high-level health and development planners get so absorbed in macro issues of health economics that they lose sight of the micro (or human) issues. They focus on how health ministries faced with increasing demands and shrinking budgets can function 'cost effectively' rather than on how impoverished families can cope with falling wages and rising costs of both food and health services. Little research has been done to examine the extent to which the money poor families spend on health care affects the nutritional status, and thereby on health and survival, especially of women and children. Yet such questions are of crucial importance when considering the current trends towards privatisation and cost recovery.

Ever since the western medical model was introduced into southern countries in colonial

times, it has been a two edged sword. Its urban-based, doctor controlled, expensively equipped 'disease palaces' have always catered to the privileged. The few health services directed at the 'natives' were mainly designed to keep them productively working in plantations and/or factories owned by the rich. Thus in the colonial era, health for the poor was not seen as a right, but as a requirement for well-managed performance of labour.

In the post-second world war era, there was an evolving social consciousness that all people are entitled to the same basic rights and that society has a responsibility to make sure the basic needs of all people are met, regardless of gender, race, class, and relative ability or disability. As a part of this new basic needs approach, development planners sought ways to make western medical and health services more widely accessible to underserved third world communities. Thus rural dispensaries were set up and staffed by modestly-trained health auxiliaries. While this 'rural penetration' of western medicine brought some benefits, it also created new problems. One was added costs to consumers. Even where services were subsidised, travel to the dispensaries, which were few and far between, involved time and expense. Medicines, when available, were often costly; or sick persons were referred to a distant hospital at still greater costs to the poor family. Under the influence of new wonder drugs, people's faith in low-cost home remedies began to decline. 'A pill for every ill' became standard treatment and injections acquired a magical ethos. Budding multinational pharmaceutical companies capitalised on this growing drug dependency. The medicalisation and commercialisation of health care, together with an erosion of traditional forms of self-care, became a growing obstacle to health.

HEALTH CARE: AN OBSTACLE TO HEALTH

Several years ago a group of village health workers from Mexico and Central America went to the Philippines to exchange ideas. Near Tacloban we visited the Makapawa community-based health programme. Among other innovations, local health workers had organised neighbourhood groups to make their own herbal medicines for common ailments. These combined traditional lore with modern science. Cough and cold syrups contained bitter orange, high in Vitamin C. An 'ABC drink' for diarrhoea was an oral rehydration mix with tasty herbs added. In festive gatherings, men, women and children took part in preparing these handy home remedies.

The Makapawa health workers proudly told us that after only two years child malnutrition and mortality had decreased. We asked why. They said it might be the nutrition training for mothers during 'under fives' clinics. But the mothers present said, "Not so! For years visiting nurses have lectured us on how to feed our children. If we don't feed them right, its for lack of money, not know-how." Yet the mothers confirmed that current wages were lower than before. So why, we asked, had their children's health improved? At first, no one had an answer. We asked how much the mothers were spending on health care: herbal medicines, modern medicines, travel to doctors, etc. The average turned out to be 10 to 12 per cent of family earnings. We said this was low compared to other lands we had visited, where some poor families spent 30 per cent or more of their earnings on health-related expenses. Then one mother said, "We don't spend nearly as much now as we used to." Others agreed. Before the programme began some families had spent over 40 per cent of their earnings on health-related costs. Their hungry children were constantly getting sick. A family would first spend on a witch doctor, then on modern tonics and cough syrups, and finally on costly trips to city doctors and hospitals. In emergencies they had to borrow from 'loan sharks', and pay back for years. If their children recovered, little money was left to feed them and soon they fell ill again.

"But now when our children have coughs or colds or diarrhoea we give them our home-made medicines", explained one mother. "That leaves more money for food (and for medical help when really needed). So our children are fatter and get sick less often. We save even more on health expenses. So we can feed our children still better! And now they die less often!"

"You know what we're saying!" exclaimed one mother. "We're saying it was what we

were spending on health care that was killing our babies!" Thus the mothers recognised that by avoiding some of the high costs of commercial medicine, and by rediscovering the value of certain traditional forms of healing, they could better protect their children's health. Another factor, they realised, was that their health workers had helped them organise and share in times of need, to avoid falling prey to the loan sharks.⁴

By the late 1970s, wide recognition that the western medical model was still failing to adequately improve third world health levels led to growing demand for reform. In 1978 the World Health Organisation (WHO) and UNICEF convened the famed global conference endorsing the Alma Ata Declaration. To advance toward Health for All by the Year 2000, the declaration called for a potentially revolutionary approach. Primary health care (PHC) was conceived as a comprehensive strategy that would not only include an equitable, consumer-centred approach to health services, but would address the underlying social and political determinants of health. It called for accountability of health workers and health ministries to the common people and for social guarantees to make sure that the basic needs – including food needs of all people are met. In recognition that socially progressive change only comes from organised demand, it called for strong popular participation. Unhappily, these high expectations of Alma Ata have not been met. Today, 17 years later, it is painfully evident that the goal of Health for All is growing more distant, not just for the poor, but for humanity. Some critics say that primary health care has failed. Others protest that it has never really been tried.

Strategically, there have been three major events that have sabotaged the revolutionary essence of primary health care: (1) the introduction of selective primary health care at the end of the 1970s, (2) structural adjustment programmes and the push for user-financed health services, introduced in 1980s, and (3) the take over of third world health care policy-making by the World Bank in the 1990s. All three of these monumental assaults on primary health care are a reflection of the prevailing regressive socio-political and economic trends.

SELECTIVE PRIMARY HEALTH CARE

No sooner had the dust settled from the Alma Ata Conference in 1978, than top-ranking health experts in the north began to trim the wings of primary health care. They asserted that, in view of the global recession and shrinking health budgets, such a comprehensive approach would be too costly.

If any health statistics were to be improved, they argued, high risk groups must be 'targeted' with a few cost-effective interventions. This new politically-sanitised version of PHC was dubbed selective primary health care.

UNICEF had been a strong advocate of Comprehensive Primary Health Care as declared at Alma Ata. But frustrated by the unwillingness of major donor agencies and health ministries to seriously promote such a radical model, and pressured by the socially retrograde political climate of the 80s, UNICEF soon compromised. It began to advocate selective PHC as being more 'realistic'. Through its so-called Child Survival Revolution – which some critics called a counter-revolution – UNICEF prioritised four interventions known as GOBI (growth monitoring, oral rehydration therapy (ORT), breast-feeding, and immunisation). UNICEF later attempted to broaden its limited package of health technologies to GOBI-FFF (adding food supplements, female education, and family planning). But in practice, in most countries PHC became even more selectively reduced to the twin engines of Child Survival: ORT and immunisation.

The global child survival campaign quickly won high-level support. For those in positions of privilege and power, it was safe and politically useful. It promised to improve a widely accepted health indicator, namely, child mortality, while it prudently skirted (except in rhetoric) the social and economic inequities underlying poor health. Not surprisingly, many health professionals, governments, and USAID quickly jumped on the child survival bandwagon. Even the World Bank – which had previously not put much investment in health – began to lend its support. But technological solutions can only go so far in combating health problems whose roots are social and political. Predictably, the child survival initiative has had less impact than was hoped. Over 13 million children still die each year (roughly the same number as 15 years ago, although the percentage is somewhat reduced). Most of these deaths still are related to poverty and undernutrition.

It has become increasingly clear that reducing child mortality through selected technological interventions does not necessarily improve children's health or quality of life, especially if they do little to combat poverty or improve living standards. During the 1980s a disturbing pattern began to emerge in the health indicators of some poor countries, while child mortality rates dropped, undernutrition and morbidity rates increased. Such a pattern bodes an ominous forecast. And sure enough, in the late 80s and early 90s in many countries the decline in child mortality rates has now

slowed or halted, and in several countries (especially in sub-Saharan Africa) child mortality is increasing.⁵

Equally disturbing, the two most heavily promoted technologies for reducing child mortality are proving difficult to sustain. Since the start of the 90s, there has been a backslide both in Oral Rehydration Therapy usage and Immunisation coverage.⁶ The recent decline in immunisation and corresponding increase in polio cases are shown on the two graphs from UNICEF's *State of the World's Children Report, 1994*. As for oral rehydration, even Egypt's national programme – long upheld as the great success story – has in the 90s experienced a precipitous decline in ORS usage rates, from more than 50 per cent, down to 23 per cent.⁷

The disappointing and in some countries diminishing impact of Oral Rehydration Therapy can in part be explained by structural adjustment policies, which have methodically shifted the costs of health services and products onto the poor. But it is partly due to the dependency-creating, disempowering way the technology was introduced. As we all know, there are two basic approaches to ORT: (1) manufactured packets or oral rehydration salts (ORS), and (2) 'home fluids'. Strong encouragement of appropriate home fluids promotes greater self-reliance and control over diarrhoeal disease at the family and community level. Home fluids are less costly, more rapidly and reliably available, when prepared with cereals or starches can be safer and more effective than the sugar-based ORS formula.

But from the start, WHO, UNICEF and USAID put their biggest investment into factory-made packets, thus pharmaceuticalising a 'simple solution' and creating dependency on a product whose price and availability lie outside family and community control. At first ORS packets were distributed free. But when health budgets were slashed by adjustment policies, health ministries were pressured to privatise both production and distribution. This commercialisation of a potentially "life saving technology", means that today many poor families spend up to one-fourth of their day's wage for one packet of ORS. Since undernutrition is the predisposing cause of death from diarrhoea, it is easy to see how social marketing that induces poor families to spend their limited food money on ORS packets may be counterproductive in terms of lowering child mortality. However, virtually no studies have been done to determine how family expenditure on ORS may negatively effect child nutrition and survival.

Apart from promoting needless spending by poor families, privatisation of ORS has made teaching about oral rehydration more problematic. As you know, here in India there is an array of ORS products on the

market, designed for mixing with quantities of water ranging from one litre to 1/3, 1/4 and 1/5 of a litre. This wide variation makes it impossible to teach families how to mix a safe and effective ORS drink. All the health worker can tell mothers is, "Follow the instructions on each packet". But in a land where most women cannot read, following such instructions is not easy. The probability of preparing dangerously concentrated ORS drinks has increased.

Wisely, in the last few years, UNICEF and WHO have begun to place more emphasis on increased home fluids and continued feeding (including breast-feeding) rather than such disproportionate emphasis on ORS packets. But after a decade of marketing the packets as a wonder drug, it is proving difficult to re-educate people (and especially health practitioners) that they can save both money and lives by using appropriate home drinks. Some health activists draw a parallel between the misdirected promotion of ORS packets and that of bottle-feeding. Both involve commercial products which are more costly, more nutritionally counterproductive, more dependency-creating, and more exploitative of the poor, than are the corresponding home drinks. Zimbabwe is one country that has taken a courageous stand in favour of home solutions and has refused to use ORS packets. The Zimbabwe health ministry firmly refuses to let ORS packets be used even in health centres, on the grounds that this would make people think home drinks are a second best substitute. Instead, nurses teach mothers how to prepare and give the same rehydration drinks they are encouraged to use at home.

STRUCTURAL ADJUSTMENT PROGRAMMES AND COST-RECOVERY PLANS

The next big set-back to primary health care has been the introduction, during the 1980s, of structural adjustment programmes (SAPs). Engineered by the World Bank and IMF, (SAPs are, in essence, a way of making poor people pay for the irresponsible lending by the rich in the north to the rich in the south. By the beginning of the 80s, the 'development' strategies imposed by the north on the south had begun to backfire. The Big Beautiful development paradigm – pushed in the 60s and 70s by huge loans from northern banks – made poor countries more dependent on the global market with its ruthless ups and downs. With the introduction of large-scale, machinery-intensive agribusiness and industry, land and wealth concentrated into fewer hands. Landlessness, unemployment, poverty, and hunger increased. Growing

unrest brought more repressive measures of social control. Even in countries that experienced 'economic miracles', like Brazil, real earnings of workers drastically declined. More trickled up than trickled down. In sum, for vast numbers of people development really meant underdevelopment. It brought deteriorating living conditions and denial of basic rights.

But troubles were just beginning. By the start of the 80s poor countries were faced with staggering foreign debt. Huge interest payments offset any benefits from economic growth. As third world economies began to falter, northern banks withheld new loans, and scores of countries went into a fiscal tailspin. Some – beginning with Mexico in 1982 – announced they simply could not pay. The banks with billions of dollars in loans to poor countries, feared economic collapse if debtor countries defaulted on their loans.

Then the World Bank and IMF came to the rescue (primarily of the northern banks). They gave countries in crisis bail-out loans to keep servicing their huge debts and hopefully to restore economic growth. But strings were attached to these loans, mainly in the form of structural adjustment programmes. SAPs were designed to streamline poor country economies so as to free up money for servicing foreign debt, and to bind poor countries into international trade accords that favour big business and 'free market' interests in the north. SAPs have usually included the following components: cutbacks in public spending, privatisation of government enterprises, freezing of wages and freeing of prices, increase of production for export rather than for local consumption, reducing tariffs and regulations and creating incentives to attract foreign capital and trade, and reducing government deficits by charging user fees for social services, including health.

In sum, such policies add up to "transferring resources to investors and lowering payments to labourers". "Inevitably, they hit the poor hardest. Budgets for so-called 'non-productive' government initiatives such as health, education, and food subsidies are ruthlessly slashed, while bloated military expenditures were mostly left untouched. Public hospitals and health centres were sold to the private sector, pricing their services out of reach of the poor. Falling real wages, food scarcity, and growing unemployment due to government layoffs all joined to push low-income families into worsening."

The overall impact of adjustment has been hotly debated. At first the World Bank denied that structural adjustment has hurt the poor. (This is like the tobacco industry saying there is no proof that smoking causes lung

cancer.) More recently, the Bank has conceded that adjustment may have caused temporary hardships for low income families, but that such austerity (starvation of children?) is necessary to restore economic growth. Ignoring the historical record, the Bank still seems to think that by helping the rich get richer, the benefits will somehow trickle down to the poor. But the evidence is overwhelming that structural adjustment, linked with other conservative trends in recent years has caused a major set-back to third world health.¹⁰ The World Bank defends its strategies with reports and graphs showing that over the past 30 years third world health has steadily improved. However, these reports shrewdly downplay the fact that in many countries improvements in health have slowed down or stopped since the mid-80s, and more so in the 90s.¹¹ In some countries rates of undernutrition, tuberculosis, cholera, STDs, plague, malaria, and other indicators of deteriorating conditions, have been drastically increasing.

In spite of a modicum of development aid from the north, in the 1990s more than \$ 60 billion net flows each year from the poor countries to the rich. GATT and recent 'free trade' agreement, as currently drafted, are more likely to increase than decrease this inequity. Today, the income of the richest 20 per cent of the world's inhabitants is 140 times as great as that of the poorest 20 per cent. And worldwide the gap between rich and poor has grown 30 per cent in the last 10 years. Although enough food is produced in the world to feed all people adequately, according to the UNDP nearly one quarter of the world's people do not get enough to eat.

User-financing or cost recovery schemes, together with privatisation of public health services are among the adjustment policies mandated by the World Bank and IMF. UNICEF has also promoted user-financing of village health posts through the so-called Bamako Initiative, now functioning in many African countries and elsewhere. While UNICEF has some reservations about the initiative, it argues that in today's hard times it sees no better alternative. Cutbacks in health budgets during the 80s resulted in closure of many rural health posts, largely for lack of medicines. UNICEF knows that people want medicines and are willing to pay for them. So through Bamako, consumers are charged enough for drugs to keep the health posts stocked and functioning. UNICEF has tried to make the Bamako Initiative user-friendly and community controlled (c.f. UNICEF's Adjustment with a Human Face).¹² Indeed, the programme does have a number of positive features. For one, only essential drugs are used (although, perhaps counterproductively, ORS packets

are sold as an 'essential drug' for home use). Also, in some of the Bamako community-run health posts I have visited, local participation has been active and enthusiastic. But many cost-recovery schemes have serious – and perhaps life-threatening – drawbacks. Just because poor families are willing to pay for medicines does not mean they can afford to pay for them. As we saw in the Philippines, poor families often spend for medicine the last pennies; they need to feed their sick children. And when health posts are financed through sale of drugs, the temptation to over-prescribe is great. Also, because the poorest families get sick most often and tend to require more medication, they may carry more than their share of costs for the health post. While Bamako has provisions to charge less to the poorest of the poor, such safety nets work better on paper than in practice. Studies in some countries have shown that when cost-recovery has been introduced, utilisation of health centres by high risk groups has dropped. For example, in Kenya the introduction of user fees at a centre for sexually transmitted diseases caused a sharp decline in attendance and an increase in untreated STDs.¹³

Whatever, their short-term impact, the introduction of these so-called cost-sharing schemes has disturbing long-term social and ethical implications. It represents a retreat from progressive taxation, where society takes from the prosperous to benefit the least fortunate, in a sense of fairness and sharing. Placed in historical perspective, when decision-makers begin to inflict destitute and undernourished people with an increased portion of health-related costs, this is a great step backwards. It means that for those in greatest need, health care is no longer a human right.

WORLD BANK TAKEOVER OF HEALTH POLICY PLANNING

The World Bank's 1993 World Development Report, *Investing in Health*, has put the last nail in the coffin of the Alma Ata Declaration.¹⁴ Turning Health into Investment would be a better title, for the Bank takes a dehumanisingly mechanistic marketplace view of both health and health care. When stripped of its humanitarian rhetoric, its chilling thesis is that the purpose of keeping people healthy is to promote economic growth. Were this growth to serve the well-being of all, the Bank's intrusion into health care might be more palatable. But the 'economic growth' which the Bank invariably promotes as the goal and measure of 'development' has invariably benefited large multinational corporations, often at great human and environmental cost. The World Bank tells

us it has turned over a new leaf: it now recognises that sustainable development must take direct measures to eliminate poverty. Yet the Bank has so consistently financed projects and policies which worsen the situation of disadvantaged people that we must question its ability to change its course. A growing number of critics suggest that perhaps the most effective step the World Bank could take to eliminate poverty would be to eliminate itself.

On first reading, the Bank's strategy for improving health status worldwide sounds comprehensive, even modestly progressive. It acknowledges the economic roots of ill health, and states that improvements in health are likely to result primarily from advances in non-health sectors. It calls for increased family income, better education (especially for girls), greater access to health care, and a focus on basic health services rather than tertiary and specialist care. It quite rightly criticises the persistent inequity and inefficiency of current third world health systems. Ironically, in view of its track record of slashing health budgets, it even calls for increased health spending ... So far so good. But on reading further, we discover that under the guise of promoting an equitable, cost-effective, decentralised, and country-appropriating health system, the World Bank's key recommendations spring from the same sort of structural adjustment paradigm that has worsened poverty and lowered levels of health.

According to the Bank's prescription, in order to save 'millions of lives and billions of dollars' governments must adopt "a three pronged policy approach of health reform: (1) Foster an enabling environment for households to improve health; (2) Improve government spending in health; (3) Promote diversity and competition in the promotion of health services."

These recommendations are said to reflect new thinking. But stripped of their Good Samaritan face lift, and reading the Report's fine print, we can restate these three prongs more revealingly: (1) "Foster an enabling environment for households to improve health" means requiring disadvantaged families to cover the costs of their own health care... in other words, fee for service and cost recovery through user financing; putting the burden of health costs back on the shoulders of the poor. (2) "Improve government spending in health" means trimming government spending by reducing services from comprehensive coverage to a computerised selection of cost-effective measures ... in other words, a new brand of selective primary health care. (3) "Promote diversity and competition" means turning over to private, profit-making

doctors and businesses most of those government services that used to provide free or subsidised care to the poor... in other words, privatisation of most medical and health services: thus, pricing many interventions beyond the reach of those in greatest need.

So we find the Bank's new health policy is old wine in new bottles: a rehash of the conservative strategies that have systematically derailed comprehensive primary health care – but with the added shackles of structural adjustment. In essence, it is a market-friendly version of selective primary health care, which includes privatisation of medical services and user-financed cost recovery.¹⁵ As with other selective PHC schemes, it focuses on technological interventions and glosses over the social and legislative determinants of health; issues such as legalisation of abortion and abandoned children. One reviewer (David Legge) observes that the World Bank Report is "primarily oriented around the technical fix rather than any focus on structural causes of poor health; it is about healthier poverty".¹⁶

The Bank prioritise health interventions by calculating their relative cost effectiveness. This is measured by the number of disability adjusted life years (DALYs) saved through each intervention. The cost of each intervention is weighed against the person's potential 'productivity' (i.e. contribution to economic growth). Each disease and ailment is classified according to how many years of productive (disability free) life the individual loses as a result. The Bank has studied and prioritised 47 different public health and clinical interventions, expressing their benefits in DALYs achieved. For example, leukaemia treatment is not cost-effective, only 10 DALYs being saved for \$ 10,000, while Vitamin A supplementation achieves nearly 1 DALY for \$ 1.

In calculating DALYs, years of productive life lost are weighted according to age and work potential. Hence children and the elderly have lower value than young adults, and presumably disabled persons who are unable to work are awarded zero value and therefore have little or no entitlement to health services at public expense. The very term Disability Adjusted Life Years is an affront to disabled persons. (The DALY prioritisation method which authoritatively deprecates disability has the stench of eugenics. Disabled activists need to join with health rights activists to protest this potentially neo-fascist policy.)

The *Investing in Health* Report advocates that governments should favour, an environment that enables households to improve health. But to do this it does not

call loudly for fairer wages or stronger labour unions. Instead, as always, it recommends economic growth policies backed by structural adjustment programmes which, it claims, will eventually raise income per capita. In making this recommendation, the Bank ignores the fact that in many countries with SAPs average per capita income has plummeted. Even in countries whose economies have partially recovered, most gains have been pocketed by the wealthy; poor people's real income has tended to decline.

With its call for "greater diversity and competition in the provision of health services, promoting competitive procurement practices, fostering greater involvement by non-government and other private organisations, and regulating insurance markets", the Bank's new policy for the third world sounds suspiciously like the health care model of the US. It argues that private health care for individuals gives more choice and satisfaction and is more efficient. But there is little evidence to support this claim. The US health system, dominated by a strong profit-hungry private sector, is by far the most expensive in the world, yet US health statistics are the worst among the northern industrialised nations. Indeed some US health indicators are worse than those of certain third world countries. Most striking is the extreme iniquity of the US health system; Washington, DC, with its large low-income population, has poorer child and maternal mortality rates than Jamaica.¹⁷ Several US inner cities have immunisation rates as low as 10 per cent and for the last several years deaths from measles in the US have been increasing.¹⁸

The commercial medical establishment and some large NGOs have celebrated the World Bank's Investment in Health strategy as a 'breakthrough' toward universal, more cost-efficient health care. But most health rights activists see the report as a masterpiece of disinformation, with dangerous implications. They fear the Bank will impose its recommendations on those poor countries that can least afford them. With its enormous moneylending capacity, the Bank can force poor countries to accept its blueprint by tying it to loans, as it has done with structural adjustment. In addition the Bank states that it will encourage the donor community "to assist by financing the transition costs, especially in low-income countries".

CALL FOR ORGANISED PROTEST

It is an ominous sign when a giant financial institution with such strong ties to big government and big business bullies its way into the field of health care. Yet

according to the British medical journal, *The Lancet*, the World Bank is now moving into first place as the global agency most influencing health policy, leaving the World Health Organisation in a weaker second place.¹⁹ Despite all its rhetoric about alleviation of poverty, strengthening of households, and more equitable and efficient health care, the central function of the World Bank remains the same: to draw the rulers and governments of weaker states into a global economy dominated by large multinational corporations. Its loan programmes, development priorities, and adjustment policies have deepened inequalities and contributed to the perpetuation of poverty, ill health, and deteriorating living conditions for at least one billion human beings.

In various parts of the world, concerned groups are attempting to engender a broad-based protest of the pernicious policies of the World Bank and IMF. Health Action International has put together a packet of writings from a wide variety of sources, criticising the 1993 World Development Report and alerting health activists to oppose it. Covering a broader critical analysis, "50 Years Is Enough" is an international coalition organised around the 50th anniversary of the World Bank and IMF. Involving scores of environment, development, religious, labour, student, and health groups, it represents an unprecedented worldwide movement to reform these International Financial Institutions. At the same time, many groups and networks around the globe are working on health and development issues from a grass roots perspective, trying to listen and respond to what people want. They are attempting to create broad public awareness of our current global crises, and to organise a groundswell of pressure from below on the world's policy-making bodies. Two such grass roots coalitions based in the south are the Third World Network based in Malaysia, and the *International People's Health Council*, based in Nicaragua.

It is urgent that all of us concerned with the health and rights of disadvantaged people become familiar with the World Bank's *Investing in Health* Report. We must speak out clearly about the harm its policies are likely to do, and clarify whose interests those policies serve. New communications methods are needed to alert ordinary people to far-reaching concerns, and to counter massive disinformation, which has become the most effective strategy of social control. Never has the need been greater for a co-ordinated global effort to demand that world leaders and policy-makers be accountable to humanity.

Panchayat Raj and India's Two Societies

T V Sathyamurthy

New Horizons for West Bengal's Panchayats: A Report for the Government of West Bengal by Nirmal Mukarji and D Bandyopadhyay; Government of West Bengal Publication, Calcutta, pp 69.

THE Indian Constitution was fashioned in an atmosphere in which the political elite was committed to a unitary view of the post-colonial state. The reason for this lay in a number of inter-weaving factors of which the partition was but one. Of equal importance to partition in this regard was the significance attached by the framers of the Constitution in general, and the Congress Party in particular, to the emergence of a single cohesive over-arching and all-encompassing nation state. The Indian national bourgeoisie and their supporters were of the view that the development of capitalist relations of production in India was bound up with the emergence of an ever-expanding market, and, towards this end, at least in the medium run, with the establishment of a system of centrally-planned production of the essential ingredients of a modern industrial economy. A power structure, in which the centre would be disproportionately powerful, was crucial to the achievement of this goal.

The central government, for its part, and the Congress Party that took control of it in 1946, strongly subscribed to the view that its role was to reflect and represent the interests of the Indian national bourgeoisie (equated with the industrial bourgeoisie during the first phase of India's post-colonial history), whilst acting as a controlling force in keeping the mass of the people (and, in particular, the working classes) in check. The homogeneity of the power wielding elite at the centre and in the states (as well as its interchangeability between the two foci of political power), during the first two decades of independence, gave rise to the illusion that the Indian state could be controlled in a harmonious fashion by those in power at the centre and in the state capitals at the head of the various state governments.

However, even the mildest tendency towards dissidence, let alone autonomy, was met with a disproportionate show of force by an intolerant centre, always ready to interpret independence of thought as an unpatriotic and anti-national act. Thus, over five years before the Kerala state democratically returned a CPI-led government to power (1957), the PEPSU government, which had changed hands as a consequence of a minor democratic *bouleversement* in the assembly, resulting in the Congress Party losing its majority, was

immediately brought to heel by the centre. President's rule was hastily invoked for the first time. The errant ministry was dismissed as a prelude to political manoeuvres aimed at restoring the Congress Party to power - an unusual augury of the political difficulties that were to be compounded in that sensitive area of the relationship between the different tiers of government.

BELOW THE STATE

Discussions of the tortured relationship between the centre and the state in India often ignore the reluctance shown by state governments to devolve political power to the district and sub-district levels. The behaviour of most state governments, at least until the mid-80s, in this respect, has been of a piece. Although at one level, it is no more than a replication of the ideology of the Congress Party towards the lower tiers of government, yet at another level even a regional party such as the DMK/AIADMK has been known to be an adamant concentrator of power at its own headquarters (which, in this case, is the capital of the state concerned).

To some extent, this constitutes a reflection of the relatively low level of differentiation of the agrarian economy, whereby intra- and inter-class conflicts do not come into sharp and conflictual focus on the political arena. At the same time, the character of industrial development of the state - which depends upon the centre's benevolence and on the rise of small and medium industry (for which the state government can act as a catalyst, and on occasion, even as a benefactor) - has been such as to pose no urban challenge to the ruling party at the state capital. For the rest, the life-line of the regime stretches over its ability to deploy a brand of populism with the aim of mobilising the lumpen elements in order to unleash anarchic violence against those who are critical of the government and demand a more democratic distribution of power.

In those regions (e.g., especially where the Green Revolution was introduced during the 60s) in which differentiation has been pronounced (and new class layers or strata of rich and middle peasantry as well as poor peasantry and agricultural labour have appeared), the state governments (and the

Congress Party) have been less able to resist persistent demands for greater devolution, democratisation and local autonomy. The approaches adopted by different states have been shaped by appropriate local (i.e., regional) factors. Thus, even during the early years of independence, the state of Bombay (subsequently, the states of Maharashtra and Gujarat) adopted a policy of devolving administrative responsibility through a system of modified panchayati raj (with the district administrative structure, under the collector, as the fountain of power). This is not the appropriate place to consider the precise circumstances under which such changes take place, but it is worth pointing out that even in a state such as Maharashtra, with the accretion of the districts of Vidarbha (which had a different background from, say, the relatively prosperous coastal districts of the former Bombay presidency), the blueprint for the devolution of administrative responsibilities, as originally conceived, could not be followed uniformly throughout the state.

The decade of the 60s ended with the splits (of qualitatively different kinds) within the ruling party at two levels. At the centre, the party split into the Congress (R), a major segment under Indira Gandhi's leadership, and the Congress (O), a minor segment under the control of the 'Syndicate'. At this level of the party, there was no difference in orientation between the two segments over the question of centralised unitary control of the power of the state.¹ At the state or regional level, however, the split was more complicated for two major reasons. First, the state Congress Party suffered serious internal splits in those states in which new classes with specific interests came into being as a direct consequence of the Green Revolution (e.g., Punjab, Haryana, western Uttar Pradesh, and certain parts of Bihar). In the Punjab, this phenomenon was uniquely combined with the movement for regional autonomy of the Sikhs whose loyalties were divided between the Congress Party and the Shiromani Akali Dal (SAD). In Uttar Pradesh, Haryana and Bihar, where there were no sizeable parties in opposition to the Congress, the Congress Party itself underwent splits, the 'splittists' in these cases being, invariably, the political representatives of the newly emerging agrarian classes (especially the

rich and middle peasantry), of which Chowdhury Charan Singh was the first pre-eminent inter-state leader.

At the level of the central party organisation, the split between Indira Gandhi and the 'Syndicate' was hardly ideological on the dimension of the centre versus the regions/states, and the former's donning the mantle of radical populism had nothing whatsoever to do with power-sharing between the centre and the states, let alone increasing the democratic content of Indian politics. A specific thrust to local power, albeit power confined to representatives of the rich and middle peasant classes, was given by the political forces which developed along Lok Dal lines (and its subsequent transmogrifications and internal realignments). The competition for power in these states, from the late 60s onwards, was between those who were seen by the rich and middle peasantry as more truly representative of their economic or class interests.

The premiss of the primacy of central power has never acquired the status of a hegemonic idea in India – not even in the halcyon days of the early phase of Nehru's prime ministership. The reason for this lies in the by no means negligible influence exercised by the ethos of decentralised, devolved or local power in the strands of political thinking associated with leaders such as Gandhi (and, since his death, in the Sarvodaya movement), Jaya Prakash Narayan, Ram Manohar Lohia, and Socialists of various hues, all of whom resisted the temptation of office. At a theoretical level, any discussion of the relations between central authority and local democracy that concentrates on the structures of power to the exclusion of movements of democratic resistance originating in a variety of forces of opposition – at the grass roots, in the regions, and in among the 'weaker' sections of society (e.g. dalits, adivasis, scheduled castes and backward class, poor peasantry, agricultural labour, marginalised workers and women) – can only throw partial light on the question of devolution of power, involving a double distortion. On the one hand, such accounts exaggerate the omnipotence and ubiquitousness of central power (and, by extension, power wielded in state capitals ruled by regional parties with equally centralising tendencies); on the other, they underestimate the potential of the locality or periphery, as the case may be, to liberate itself from at least certain aspects of dominance by the centre and to increase, to a corresponding degree, its democratic capability.

Regional parties in opposition to the Congress (e.g. DMK, AIADMK, Telugu Desam and, to a limited degree, the SAD and the Asom Gana Parishad and, latterly, the Yadav-dominated Samajwadi Party of

Uttar Pradesh and Janata Dal of Bihar) have, in differing degrees, mounted struggles to supplant dominant higher castes and replace them with middle and lower middle castes (reminiscent of the struggles between tenants and zamindars in the latter part of the 19th century) in executive political control of state governments. Exceptionally, in Bihar, this kind of struggle has, to a limited extent, taken on a slightly different colour – mainly due to the initiative of Karpoori Thakur who, as chief minister during the Janata interlude of the late 70s, did attempt to broaden the interpretation of the caste equation of power by reaching further down the caste hierarchy than any other regional party leader.² In the present decade, Laloo Prasad Yadav has added a somewhat variegated and successful caricature of the political experience bequeathed by the shortlived Karpoori Thakur regime.

I shall return to the question of democratic devolution of political power to the weakest sections of the population (at the grass roots level) towards the end of this essay. For the moment, I shall limit the discussion to the institutional aspects of the extension of democratically elected government by increasing the number of political tiers to five throughout the country (under the provisions of the 73rd and 74th Amendments to the Constitution) – the centre, the state, the zilla, the samiti and the panchayat (or cluster of villages). The interest of the report by Mukarji and Bandyopadhyay lies in the crucial role which the communist parties have played, since the 50s, in the consolidation of local power through elected local government in those states in which they have wielded considerable political influence and enjoyed popularity among the mass of the people. Nowhere has this role been so successfully played and on such a basis of continuity (over 17 years to date) as in the state of West Bengal which has returned four successive CPI(M)-led Left Front coalition governments to power since 1977.

EXPERIMENTS IN DEVOLUTION

The characteristic features of the experiments in the devolution of power in India can be best understood against this historical background. It is well known that the first systematic blow in favour of power-sharing between the centre and the states was struck by the multiple coalitions (and the DMK in Madras³) which defeated the Congress in eight states in the general election of 1967. These coalitions embraced the whole of the political spectrum from the ultra-conservative Swatantra Party to the most radical left wing electoral party (namely, the CPI-M).⁴

But it was not until 1977 that relatively stable opposition governments at the state

level became a reality in several states. During the 80s and 90s, a majority of state governments have emerged which are ruled by parties or coalitions opposed to the Congress(I). During the last two decades, too, the hold of the Congress(I) on the Indian state has been challenged by a variety of political forces – in the form of coalitions which have included both parties with a highly centralising orientation (and therefore in that respect no different from the Congress) towards political and state power, e.g. the BJP, the Congress(O) and other splinters of the Congress Party, and parties with a relatively decentralising general orientation towards state power and a more or less strong commitment to autonomy at levels below the centre and the state, often down to the village (e.g. the Socialist Party, the Lok Dal, Janata Dal and parties that have split off from these).

In practice, however, even the party with the greatest de-centralising tendency among those opposed to the Congress (such as the lower caste political formations in Uttar Pradesh and Bihar) has never shown a democratising propensity beyond empowering the more wealthy and influential rural segments of the lower middle castes at the expense of those castes which until recently have been entrenched in local power. Moreover, its assumption of executive control of the state government is invariably accompanied by repressive violence being directed against the politically articulate segments of the lowest castes, mainly consisting of adivasis, dalits, scheduled castes, poor peasantry, agricultural labour, and especially their women.

The efforts to devolve political power and to suffuse the three lowest tiers of government with it must be viewed against the backdrop of an extremely complex process of socio-economic differentiation and contradiction. This has been taking place under conditions of acute and endemic scarcity, and within structures consisting of layer upon layer of encrusted and entrenched influence and power stoked up by corruption and venality which have reached monumental proportions during the last quarter of a century.⁵

Of all the attempts made by state governments to institutionalise democratically elected local government at the district level and below, those during the late 70s and early 80s by the CPI(M)-led Left Front coalition government in West Bengal and by the Janata administration in Karnataka (under Ramakrishna Hegde as chief minister) represent the most far-reaching, serious and successful ones. In fact, so successful had the Janata experiment in local electoral democracy become that the Congress(I) ministry that was elected in the late 80s simply discontinued it, thus putting locally elected government in cold storage until

forced by circumstance (i.e., the passing of the 73rd Amendment) to restore it.

It is important to note the sociological background of the party or coalition in power in each of these cases. At the heart of the political system of Karnataka over which the Janata Party presided during the early and mid-80s, the norms of the Congress culture continued to prevail. This was amply reflected in the corruption which quickly became as pervasive a feature of political life under the Janata administration as it had been under Devaraj Urs (a former Congress chief minister) or any of the other of Hegde's predecessors, and would be under his successors. However, even though the state leadership of the Janata Party quickly succumbed to the atmosphere of corruption prevailing in the state capital, it did take seriously the party's commitment to establish electoral democracy at the three lowest levels of government.

The Janata regime's initiative in respect of panchayati raj was broadly consistent with its general orientation to devolution of power and the spread of autonomy to the local level. The CPI(M)'s enthusiasm for democratically elected structures of local power is derived from a more complex worldview. Unlike the Janata Party, the CPI(M) carries out its political work through cadres. It has to its credit a long history of (partial) consciousness-raising political activity in the countryside. In Kerala, Tripura and West Bengal, the ruling Communist Party (even from before the 1964 split) has pursued reformist goals to a greater extent than any other political organisation. The establishing of a strong democratically elected local government structure was seen as a strategic necessity for the realisation of the social benefits and the general ethos of Operation Barga, in the long run, in the countryside. Thus, the Janata Party in Karnataka (and also the Telugu Desam, during the 80s, in Andhra Pradesh) and the CPI(M) in West Bengal were motivated by different political considerations in their decision to introduce the three tiers of local administration on an elective basis. But, both were engaged in similar exercises of 'taking power to the people' (or, rather, 'taking power to the local elites').

The West Bengal and Karnataka experiments in establishing democratically elected and accountable local government structures during the late 70s and early 80s have provided the wherewithal for a blueprint applicable, with suitable modifications to take account of local/regional specificities, to the whole of India. Motivated in part by Congress(I)'s proverbial opportunism, and driven in part by necessity, the centre itself sought, during the latter part of Rajiv Gandhi's prime ministership, to put forward an alternative approach to democratically elected local government bodies. This would

have involved direct links between the Centre and the rural hinterland in different parts of the country (mediated through the district collector), conveniently overlooking the intermediate 'federal' layer of the state government structure (which, in a large number of cases, has been ruled from time to time by regional and national parties of the opposition) in the process.

In actual fact, however, with the surfacing of new political pressures (extending far beyond conventional party politics and spilling over, liberally, into areas of mass protests against the negative and anti-people policies of both the centre and various state governments) on the one hand, and, on the other, the emergence of new coalitions or the recycling of existing coalitions involving different political parties, this particular intervention of the centre never got off the ground. The only political alternative left to the central government with the dawning of the present decade was to push through amendments to the Constitution requiring all states to carry out the task of establishing democratically elected local governments at the three lowest levels (zilla, samiti and panchayat) as well as in all municipal centres. The initiative of the Left Front and Janata governments of well over a decade ago (followed by serious evaluations of their progress from time to time), can be said to have heralded the development of panchayati raj on an all-India basis. Before this millennium ends democratically elected panchayati raj will have been set in motion in all states.

FIRST SYSTEMATIC EVALUATION

It is particularly appropriate that the first systematic evaluation of panchayati raj, with pointers to the future (August 1992-February 1993) was entrusted by the government of West Bengal to two seasoned administrators. It is worth mentioning that both of them, in their different ways, are distinguished for an uncommon degree of political nous. The significance of the resulting report – along with earlier interim evaluations of panchayati raj in Karnataka (eg. by A K Ghosh) – lies not only in the light that it sheds on West Bengal but also on the general process of evaluation of elected local government which is relevant to all other parts of the country.

Nirmal Mukarji has an intimate knowledge of the problems entailed in devolution of power with special reference to the Punjab, where, as a young ICS officer, he was closely involved in the implementation of that government's policy of land consolidation. It is well known that he returned to that state as governor, from his retirement, during the brief interregnum that was presided over by V P Singh as prime minister. Debabrata Bandyopadhyay earned well deserved encomia for the crucial role that he played

in persuading thousands of bargadars to shed their feudal fears and claim their land rights under the laws passed by the Left Front government in pursuance of the policy enshrined in Operation Barga. Bandyopadhyay had had experience, as a young officer working under Harekrishna Konar (the land revenue minister of the United Front administrations of the 1967-1970 period) who, for the first time in West Bengal (or, for that matter, anywhere else in India with the exception of Kerala), took up cudgels on behalf of the poor peasantry and the agricultural workers. Until his (somewhat indecently hasty) translation to the central government in the early 80s (whereby hangs a tale which did little credit to the CPI(M) leadership), Bandyopadhyay was the heart and soul of the implementation side of Operation Barga.

The authors of this Report were concerned to gain an understanding of the issues of governance as viewed from below. To this effect, they "interacted with many small and marginal farmers, bargadars, patta-holders of vested lands, fisher-folk, landless labourers and others" (para 1.7, emphasis supplied). From the top drawer, of course, they were "privileged to meet Shri Jyoti Basu, .. Shri Benoy Chowdhury, .. Dr Ashim Dasgupta, .. and Dr Surya Kanta Mishra" (para 1.5, emphasis supplied). They also met, among others, a number of researchers, intellectuals and retired civil servants belonging to the middle drawers (para 1.6). It is necessary to make this 'hierarchical' point on the matter of who they met, and the different accents given to the various meetings, if only to draw attention to the fact that it is extremely difficult to reverse the order of importance given to informants chosen from different strata of society, even – and perhaps particularly – when the subject considered is the democratic devolution of power and the empowerment of the 'weaker sections of society'.

The language of euphemism in which we clothe our thoughts makes it wellnigh impossible even for the fair minded and forthright members of the elite such as the authors of this otherwise excellent and far-reaching Report to show a sufficiently keen appreciation of certain self-evident truths: among these is the fact that the 'vertically challenged', and economically, socially and culturally disadvantaged segments/classes/castes of society – which are also the putative beneficiaries of any 'trickle down' going in the process of development – cannot hope to obtain a fair deal for themselves, given the obstacles that they will have to overcome. This is a statement worth making in so many words not only because of its psychological and sociological salience, but also for the reason that it goes to the heart of the socioeconomic contradictions of India's caste-ridden and class-divided society.

Many parts of India are enmeshed in the dynamic interaction between the (dependent, fragmented, uneven and distorted) development of capitalist relations of production (especially, but not only, in agriculture) and the persistence (and, in some areas, even a deepening) of pre-capitalist (i.e. 'feudal') modes of production. It is difficult to exaggerate the built-in limitations in the way of "working the system" to the advantage of the disadvantaged". Mainstream political discourse is yet to become sufficiently liberated to disregard the taboos against dealing with conflict and contradiction (as opposed to consensus) as the essential prerequisites of change.

The panchayati raj initiative of the West Bengal government in 1978 evoked considerable participatory interest and generated fresh political energy. Yet, within a period of 10 years, "[a]nd with the coming of the new panchayats in 1988, [t]he innovative spirit of the early years is hardly to be seen" (para 2.6). The main task of the authors of the report was to address the question of why "the panchayats are tending to run out of steam" (para 2.7). This they do along two broad lines of enquiry – one conceptual and the other programmatic. The report correctly identifies the inherent structural weakness of the panchayats as the root cause of the mood of listlessness into which they appear to have sunk.

Fifteen 'conceptual' dimensions are identified in Chapter 3 of the report. Of these, self-governance and autonomy are theoretically and ideologically central to the long-term prospects of panchayati raj. The identification of functions, recruitment of staff, raising finances and defining the parameters of financial devolution and responsibilities, the task of managing the spread of urbanisation to certain parts of the countryside, ensuring the spread of the benefits of development to social groups which have been and are still kept out of its purview (e.g. plantations, forest villages), redrawing the politico-administrative map of the state to optimise, as far as possible, the size and sociological cohesion of districts, blocks and panchayats, widening the social base from which recruitment to local level politics is made, and, in particular, rendering panchayats accessible to new person drawn from the lower echelons (i.e. the lowest castes and the poorest sections) of local society, developing a collaborative style of well-coordinated inter-level functioning at the district, block and panchayat levels with the necessary links made in an imaginative and efficient manner, ensuring that open accounting procedures are being followed and local government accounts are being properly and regularly audited, manifesting the same thoroughness and diligence in the conduct of local elections and by-elections, at the three local levels of government as

at the state level, and evolving a suitably unauthoritarian day-to-day relationship with the state government bureaucracy and ministry – these are the subjects on which the Report has reflected in depth and against a background of a wide sampling of feeling, opinion and experience gathered in the course of their peregrinations and audiences with the powers seated on high. Quite why these should be treated as belonging to the conceptual rather than the operational level of discourse is beyond this reviewer's comprehension.

WAITING FOR SELF-GOVERNMENT

Be that as it may, let me briefly return to the general critique of local politics embodied in the chapter (paras 3.1 to 3.10). Two points are made in these paragraphs. First, the 'political kingdom' shall be extended to the lowest levels: in other words, the bureaucratic domination of the periphery by the state government should be broken. In positive terms, this would involve the conferring of such powers and authority on the panchayats by the state legislature as would enable them to function as "credible institutions of self-government". The authors draw attention to the fact that, despite its sensitivity to the question of taking politics to the people as far down the ladder as possible, the Left Front government has not yet amended the West Bengal Panchayat Act passed by the Congress administration in 1973 which completely and pointedly ignored 'self-governance' as a guiding principle of local government.

As a government which played an active role in promoting the aims of the 73rd Amendment to the Constitution, the government of West Bengal should clearly enunciate policy to the effect that the fundamental objective of panchayati raj is self-government at each level, ensure its effective communication (presumably, in the long run, through educational means) throughout society, and overhaul the panchayat law "not simply to bring it in line with the 73rd Amendment, but more importantly to give centrality to the principle of self-government" (para 3.6).

As the first state to introduce political panchayats, West Bengal was well placed to embark on the task of establishing self-governing panchayats. Under the rubric of self-government, some fine distinctions are made in the report between (devolved) powers, responsibilities, functions, duties and authority. The authors quite rightly remembering the authoritarian nightmare of the Internal Emergency of 1975-77, recommend steering clear of the terms 'authority' and 'duties'. They recommend developing the meaning of the term 'functions', which necessarily involve considerations appertaining to 'powers' and

'responsibilities'. Functions could be usefully defined as a blend between 'autonomy by right' and 'entrustment by discretion' (para 3.10).

Chapter 4, dealing with 'programmes', touches on a number of sensitive and substantive areas. Programmes constitute the life blood of the panchayats. The bulk of Chapter 4 thus properly and naturally deals with different aspects of the land question. In this sense, Operation Barga, which represents the first serious attempt at comprehensive land reform within the limits prescribed by the Indian Constitution, gave the panchayats a substantial programme of far-reaching socio-economic change in the countryside. Yet, after a high tempo of activity which lasted a period of hardly three years, the implementation of land distribution to bargadars, under the new legislation literally lapsed into a small trickle of an annual average of less than 10,000 acres of vested agricultural land. Even more alarming than the very slow rate of recording, the half a million bargadars whom the new law had not yet reached is the onset of an insidious process of reversal of certain crucial aspects of the reform. Thus, the authors came across numerous instances

in which crop sharing is not according to law and is adverse to the bargadars' interest. In Jalpaiguri it is almost universally on 50:50 basis against the 75:25 ratio prescribed by law. It is the duty of the panchayats to see that the law is enforced and that bargadars retain the crop share they are statutorily entitled to (para 4.5, p. 25).

Those who are familiar with the conditions prevailing in rural Bengal until the late 70s can only shudder at the thought of such a retrogression to the past after so brief a flicker of serious reform.

One of the remedies suggested in the report for dealing with feudal practices thus creeping in by the back door would be, following the example of Punjab (1952), to undertake a state-wide programme of consolidation of landholdings. Punjab's experiment in decentralised planning is also held up as an example in a special Appendix consisting of a paper specially prepared by the Financial Commissioner (Development), Punjab (pp 53-57). A policy of land consolidation will secure advantages for peasants with an optimum level of landholding but will also have the effect of intensifying downward differentiation among poorer peasants and agricultural labourers. This point has not even been alluded to, let alone given the importance that it deserves.

Closely related to the recent land reform is the need to reorientate, if not restructure, the system of land administration in the light of the agrarian programmes of the panchayats and, in particular, the maintenance of a detailed mauzawise record of the crops grown on each field during every crop season.

Moreover, an integrated programme of agricultural development, placing emphasis on raising environment-consciousness of rural folk and promoting educational training for them in science, is strongly urged in the Report. The authors have also made detailed recommendations on programmes involving agricultural marketing, co-operative marketing, rural credit facilities and access to these, on the establishment of "all G[ram] P[anchayat] headquarters as *focal points* for the setting up of facilities within walking distance from people's homes" (para 4.37, emphasis supplied), and of "all P[anchayat] [S]amiti headquarters as *growth centres*" (para 4.38) (constituting an intermediate level, in a developmental context, between the gram panchayat and the district), and the introduction of systematic training of panchayat level officials and elected representatives at the State Institute of Panchayats (Kalyani), as well as research in academies where our knowledge and understanding of local problems can be extended and deepened.

A long list of desiderata in the functional sphere of panchayat government and administration has been brought together in this report. It is based on West Bengal's already rich and varied experience in the sphere of local government (though not, as yet, local self-government). As such, the elective local government structures in a number of states in the country that are now being ushered in to existence (by mid-1995, all states in India will have elected self-governing local structures of power in place at the zilla, samiti and panchayat levels) already have a reasonably well-tried blueprint to go on in West Bengal. The authors of the Report have rendered a signal service by using the occasion provided by the West Bengal government's initiative to draw up a check list of functions and methods in this sphere.

IN A STRAITJACKET

Despite the enormous amount of work that has gone into the researching and putting together of this report, two major problems have been swept under the carpet, through no deliberate intention, it must be added, on the part of the authors. First, by virtue of its provenance, the remit of the Report has been limited to the sphere of institutional politics (as defined in political practice and constitutional verbiage) which are literally beyond the reach of a vast majority of the Indian masses – the disinherited, the dispossessed, the marginalised and the submerged sections of society existing below the poverty line. Even in a state (such as West Bengal), continuously ruled by a left-of-centre government (for 17 years now), noted for its sensitivity to the fluctuations of the rural social scene, and reputed for its relative lack of antipathy towards the mass

of the people, the authors have noted that the rural upper crust has begun to flex its muscle again as evidenced in the partial reversion to certain past practices in certain districts at least.

We return to the difficult question of how political power can be democratically devolved to the weakest sections of the population. The magnitude of this problem can be comprehended by visualising India as consisting of two halves – a smaller segment made up of those who, by virtue of their economic and social position, are able to benefit from the structure of power by exerting pressure of various kinds, and a major segment, consisting of the relatively undifferentiated poor, which is beyond the pale. Whilst it is true that the exercises now under way in the sphere of decentralisation of power and responsibilities (with, it may be added, no change in the pattern of central control over the purse strings) will produce a 'trickle down' effect from which the rural and local elites (e.g. small business, small retailers, etc., including members newly recruited from the lower castes, as a consequence of power at the state level changing hands from the erstwhile dominant upper castes to middle and lower middle caste elites) will benefit, they will leave the poorest 40-50 per cent of the society untouched and, perhaps, even worse off (if that can be imagined!).

Therefore, there are two societies in India, one of which is poised to receive marginal benefits from the broadening of the institutional base of power that is being promoted under two recent amendments to the Indian Constitution on the subject of decentralisation and elected self-governing local authorities. The other is left to fend for itself under regional, national and international conditions more hostile than ever before experienced, at least in India's post-colonial history.

There is and can be nothing in such a report as this for the latter of the two societies identified above. The future of the different segments of which it is composed can be charted only through political action, activism carrying a variety of impulses, and movements of resistance to institutional power in all its forms including the new avatar of decentralised power. Perhaps the authors of the Report, now that they have been released from the shackles of institutions, will offer us their meditations on the subject and tell us what the outside looks like from the inside now that they themselves are outside (I should like to think, not only physically and metaphorically but also psychologically and emotionally).

Entailed in the question raised above is the intellectual issue which can be formulated quite simply as follows: can one focus on 'decentralisation' in a straitjacketed framework of institutional power by adopting

a method of approach which addresses 'conceptual' and 'programme-based' issues separately before linking them together? After reading Report, I was left with the impression that in view of the limitations built into the approach, no serious contribution can be made on the 'conceptual' side unless the basis of state power in India is challenged and a radical interpretation of it offered which could act as a springboard on which alternative programmes may be hammered out with a view to generalising, if not universalising, the benefits of development. Questions of theory, conceptualisation, methodology and issues relating to the operational, functional and programmatic realms could thus be vigorously and democratically debated and fresh solutions aimed for. Here again, we need transfusion and suffusion of new intellectual blood imbued with an imaginative commitment to the goals of development.

Notes

- 1 Morarji Desai as prime minister was inflexible towards the Assam student movement and Sikh dissent in the Punjab which began as an agitation for greater autonomy for the state within the meaning of the Anandpur Sahib Resolution. Even Chowdhury Charan Singh (or, for that matter, Vishwanath Pratap Singh) was relatively speaking more 'centrist' or 'centralist' than 'federalist' in his political orientation. In this sense, all the prime ministers of India and their cabinets to date have been uncompromisingly 'centralist'.
- 2 Rami Manohar Lohia was the first socialist leader in India who advocated the primacy of the 'caste struggle' as differentiated from the 'class struggle'. During the last decade of his life he propagated the view that unless caste discrimination was removed there could be no future for India. Karpooi Thakur was the first politician in India's post-colonial history who attempted to put Lohia's idea into practice during his brief stint as chief minister of Bihar.
- 3 Neither the DMK nor the AIADMK was serious about devolving power to sub-state structures even though the former pioneered the agitation for more powers for the state down from the centre by appointing a committee which produced the celebrated Rajamannar Report. Thereby a start was made in the history of centre-state relations which ended with the publication of the Sarkaria Report in 1987.
- 4 Since the late 70s even some of the CPI(M-L) factions have entered the parliamentary process, mainly at the level of state legislatures. The Indian Peoples Front (IPF), a front organisation of the CPI(M-L) movement, takes part in elections at all levels.
- 5 At the lower levels, this edifice of corruption and nepotism has been maintained intact mainly through collusion between the local elites on the one hand and the all but omnipotent local bureaucracy on the other.

Liberalisation, Unemployment and Capital Reform

Ranjit Sau

The finance minister has outlined a model of economic development that envisages liberalisation and globalisation of the economy. Asset distribution in India is very skewed. Using the efficiency wage theory this paper proves with simple geometry that a competitive equilibrium in an economy with highly unequal asset holding will entail involuntary unemployment of the assetless poor. Although both are competitive, the equilibrium here sharply differs from that of an Arrow-Debreu economy which presumes sufficient assets for all agents.

East Asia had satisfied the Arrow-Debreu presumption through radical land reforms before the economic 'miracle' was initiated. South Asia and Latin America fare miserably in this respect.

If land reform is not feasible, capital reform can serve the same purpose. A scheme of capital reform has been suggested here for India. It transpires that the consumption dynamics in India may aggravate the problem of unemployment of the poor.

ON various occasions the finance minister has revealed his views on the Indian economy. His address at the Europe-east Asia economic summit, Singapore, in October 1994 rounds up the model he has in mind. Since June 1991, Manmohan Singh has been pressing for deregulation, liberalisation and globalisation. Freedom of private enterprise and competition in the marketplace, combined with provision of essential public services by the government, would unleash initiatives of the individual, ensure efficiency of resource utilisation and promote human development.

In his Singapore speech Manmohan Singh has drawn a subtle picture of the world economy where India occupies a central place. East Asia is the site of an economic miracle [World Bank 1993]. To continue the prosperity it requires external markets. Meanwhile a long recession has settled over Europe with no sign of going away too soon. In any case, the western countries are saturated with consumer durables, and their demand has become price-inelastic. Under the circumstances, India can come to east Asia's rescue.

East Asia would find in India a large market for trade and investment. With east Asia's capital investment in key sectors of India, specially infrastructure, production will rise, people will have greater purchasing power, and their appetite for import will be heightened. East Asia will then reap more than what it sows today.

India will have an open economy of private enterprise, with a social conscience. Enough wealth will be produced in the private sector, and plenty of tax revenue will flow into the public exchequer. Government will look after those who do not benefit from the market mechanism. Thus, in short, is the Manmohan model to replace the Mahalanobis model that has informed India's policy-making so far.

We consider full employment an elemental objective of the economy and society. This aspect does not figure in the Manmohan model. The present paper will show that, given the presence of a large number of assetless poor people in the country as an initial condition, a competitive equilibrium will have a sizeable volume of involuntary unemployment consisting mostly of these very poor people. Put another way, liberalisation, which essentially means introduction of market competition, cannot resolve the unemployment problem so long as sharp inequality in asset distribution persists.

The theoretical content of our essay draws upon the literature on efficiency-wage theory [Bliss and Stern 1978, Leibenstein 1957, Stiglitz 1976], in particular a most illuminating article of Dasgupta and Ray [1986]. However, the proof at a crucial step of the argument – pertaining to the shape of curve ABCD in Figure 4 – is ours, given in the Appendix.

The logic is simple. Inequality of asset distribution implies initially poverty for the deprived. Assume a direct relationship between income, which is entirely consumed, on the one hand, and the productivity of labour on the other. Poverty thus entails low productivity. Potential employers would find the services of a poor person too expensive to employ while those of a relatively well-to-do person are also available. So, poverty leads to unemployment, and vice versa. A vicious circle is thus complete. So long we have heard that unemployment causes poverty; now the table is turned: poverty spells unemployment, and thereby reinforces itself. The initial condition matters.

Adam Smith's doctrine of invisible hand as well as the Arrow-Debreu competitive equilibrium presumes an economy of asset-rich agents. India does not answer this

description. Here land is very scarce, and so is capital; and both distributions are heavily skewed.

There are two ways, it will transpire, of combating involuntary unemployment. One is to accumulate assets over time; the other is to have a more even distribution of existing assets. East Asia started out with the latter through most radical land reforms. South Asia has a miserable record on this front. Latin America fares even worse.

I

Unemployment in Competitive Equilibrium

Production takes place with two inputs, namely, labour and land. We distinguish between labour-power and labour-time. "By labour-power" is to be understood the aggregate of those mental and physical *capabilities* existing in a human being, which he *exercises* whenever he *produces* a use-value of any description" [Marx 1867: 167, italics ours]. By contrast, labour-time is fixed uniformly at, say, eight hours a day. The labour-power that a worker actually renders during a given labour-time depends, by assumption, upon the income he receives and consumes. Higher wages, beyond a threshold, means greater efficiency of labour. It is the labour-power that is an input in the production function.

A labourer may own land which enables him to receive rent. In that event his income consists of wage and rent.

This essay turns on the distinction between the wage rate per unit of labour-time and that of labour-power. A worker has one unit of labour-time to supply. There is a minimum acceptable wage rate below which he will not supply his labour-time; it is called his reservation wage. Note that reservation wage relates to labour-time.

FIGURE 1: LANDLESS LABOURER

FIGURE 2: SMALL LANDOWNER LABOURER

FIGURE 3: BIG LANDOWNER LABOURER

FIGURE 4: UNEMPLOYMENT IN COMPETITIVE EQUILIBRIUM

An employer knows that a worker's efficiency responds to the latter's income including wage. So he offers that wage which minimises the wage-cost per unit of labour-power rendered by the worker for him. The following symbols will be used.

y = income of a worker = wage + rent
 c = consumption. w = wage per unit of labour-time. r = rent per unit of land. a = land owned by a worker. f = labour-power rendered by a worker. $f = f(y)$. w' = "reservation wage". It rises with landholding. w^* = market-offered wage per unit of labour-time: it is optimal (cost-minimising) for the employer = "efficiency wage". v = market approved supply-price of labour-power = "effective supply-price" of labour-power.

Figures 1, 2, 3 and 5 show the $f(y)$ -function. Its shape is given by the following: $f(y) = 0$ for $y < m$; and $f(y) > 0$, $f'(y) > 0$, and $f''(y) < 0$ for $y > m$, where m is a parameter.

To begin with, suppose there are three persons in the economy, indexed respectively by 0, 1, 2. Person 0 has no land; person 1 owns a plot of land with rent-income less than m ; and person 2 is a big landowner defined as one having rent-income greater than m . In what follows subscripts will refer to the persons concerned. A variable common to all persons will have no subscript.

- (1) $a_0 = 0$, and $a_2 > a_1 > a_0$
- (2) $y_0 = w_0$
- (3) $y_1 = w_1 + ra_1$
- (4) $y_2 = w_2 + ra_2$

Figure 1 shows the computation of w_0^* . An employer will offer a landless worker this wage, if at all, so as to minimise the wage-cost per unit of labour-power $w/f(y)$. This efficiency wage occurs where a ray through the origin is tangential to the labour-power curve $f(y)$. By assumption, the reservation-wage of the landless worker is less than his efficiency-wage. So he accepts the job if offered at w_0^* .

Figure 2 similarly depicts the efficiency-wage of person 1 who has rent-income ra_1 . The method of derivation is much the same as in Figure 1. And the geometry clearly shows that w_1^* is less than w_0^* . This is an interesting feature.

Now there is an asymmetry. For person 2 the efficiency-wage coincides with the

the areas actually distributed was only 1.29 million acres" (Planning Commission 1978:12). The total net area sown in the country was 355.5 million acres. So land reform had not touched even 1 per cent of the cultivated area. Since then the picture remains very much the same except in some parts like West Bengal.

Evidently the landless poor are also capitalless. If the government could not do land reform it can possibly think of an alternative which is politically less demanding. Capital invested in the centre's public-enterprises stood at Rs 1,020 billion as of 1990-91 [GOI 1992:20]. Here is a possible scheme. Let the ownership of 10 per cent of this capital be granted to the poorest of the poor in the country, or to those who are just below the poverty line. A trust may be formed with this capital fund, and the annual proceeds distributed to the beneficiaries. By the theory of the preceding section, then segment AB of Figure 4 will be lowered, and full employment of the previously assetless people may become possible should a sufficient amount of capital be available for this purpose. In the absence of such a project, economic liberalisation, that by definition brings about market competition, would end up with a huge volume of involuntary unemployment of the assetless people causing widespread poverty, malnutrition, and low productivity of labour. No amount of foreign capital, accompanied by latest technology, would be able to address this denouement. The Manmohan model is likely to founder on this rock.

To put the proposed capital reform in perspective, we reckon that one-tenth of Rs. 1,020 billion is equivalent of three billion dollars at current exchange rate. As we have argued elsewhere [Sau 1994] India has suffered an avoidable deadweight loss of two billion dollars on the foreign exchange reserves of the country since 1991. The Reserve Bank of India has pegged the value of rupee to dollar. To defend that rate the RBI has been purchasing excess dollar from the market and putting it into US Treasury bills. The associated sterilisation also costs a great deal. The rate of interest on US Treasury bills is about 4 per cent; but the bonds issued by the RBI in open market operation at home for sterilisation carries interest rate of 11 per cent. Clearly the RBI loses 7 per cent on this account.

We shall argue that

$$(7) \quad v_{-} \leq v_{+}$$

From (6) and (7) the shape of ABCD-curve of Figure 4 will be deduced, for a large population with unequal distribution of land. A very simple geometric proof of (6) and (7) is given in the Appendix.

employers. So only LM people – all landowners – will be employed OL people will not get jobs even if they are prepared to work at a lower wage rate. This is involuntary unemployment. Of them OK are landless, and KL are small landowners. MN people are unemployed too; but they are big landowners; for them it is voluntary unemployment.

As for dynamics, improvement in the quality of land or accumulation of more land can raise the productivity of labour across the board; then VE-curve in Figure 4 shifts up. If such shift continues, eventually full employment of all landless and small landowning workers may be possible. Alternatively, an appropriate redistribution of the existing land can flatten ABCD-curve into VFCGE, thereby ensuring full employment for all. On the other hand, a certain pattern of consumption dynamics may force the ABCD-curve to move up, aggravating unemployment. Such a phenomenon in the case of India is not unlikely, as we shall see in a moment.

Land distribution in India is heavily skewed. The Gini coefficient is around 0.7. Paucity of land reform is amply illustrated by the following figures. "As on July 31, 1977, the estimated surplus area was only 5.32 million acres, the area 'declared surplus' was 4.04 million acres, the area 'taken over' by government was 2.10 million acres, and

Meanwhile the dollar has been depreciating relative to mark and yen, while India's foreign exchange reserves are being kept mostly in dollar assets. Therefore, the value of the RBI portfolio has shrunk in terms of mark and yen.

These losses could have possibly been avoided if the rupee was pegged to a basket of currencies like dollar, mark, and yen, rather than to the dollar alone. The RBI portfolio of foreign exchange reserves also could have been diversified across currencies. Here are some relevant data. The US accounts for 19 per cent of India's export and 13 per cent of import, the European Union 28 per cent of export and 40 per cent of import, and Japan 8 per cent of both export and import. The secular decline of dollar had begun in March 1985. During 1991-93 it was obvious that tying the rupee with dollar would mean its depreciation *vis-a-vis* the mark and the yen.

A country that can evidently afford to waste two billion dollars over three years on account of its monetary and exchange rate policy should not hesitate to distribute three billion dollars worth of public capital to its own poor. We are confident the proceeds of that capital will be put to best possible use from micro as well as macro point of view. Above all, labour productivity will rise. If anything, the Manmohan model of capitalist development will be facilitated.

III

Consumption Dynamics

A very critical assumption of the theory is that labour productivity rises with a worker's income. How strong is this presumed linkage? The findings of a consumer survey, 1992-93, conducted by the National Council of Applied Economic Research (NCAER), New Delhi, tend to raise some doubt about it. Poor households, barely above the poverty line, are absorbing a good deal of luxury products and consumer durables, probably at the expense of essential food items and nutrients. Low-income people (with less than Rs 18,000 a year) account for 18 per cent sales of lipsticks, 33 per cent of nailpolish, and 20 per cent of face cream. It was once thought that these people had barely enough to eat. But, reportedly, they are buying most of the country's detergent soaps (58 per cent), toilet soaps (80 per cent), as well as 48 per cent of tea, 38 per cent of electric bulbs, and 31 per cent of toothpaste [*The Economist* 1994 31].

Some of these numbers may be open to further scrutiny. But the behaviour pattern is not implausible. Felix (1983) had observed a very similar consumer dynamics in Latin America. Such a consumption dynamics that sacrifices essential nutrients for fancy entertainment will have the effect of shifting the ABCD-curve up in Figure 4, thereby

aggravating the problem of unemployment of the poor. The Manmohan model will require a proper reorientation in such a milieu.

Let us recall that it was Indira Gandhi who took a major initiative in the early 1980s for liberalisation of the Indian economy. Soon she had to retrace her steps, and recoil back into that time-tested slogan of 'garibi hatao' (remove poverty) which had retrieved her from the brink of the precipice on several occasions in the past. There is a school to assert that it was the Khalistan revolt which forced her back once again into populism, away from the bumpy road of economic liberalisation.

One ignores the political economy of a country at one's own peril. The Manmohan model is likely to heighten certain tensions of the polity. In a not very far-fetched scenario it will strain the social fabric of India to the limit that is too structural to be subsidised away by the government. Attainment of full employment as soon as possible is the best insurance for the Manmohan model. And herein rests the model's weakest point at the moment.

Appendix

First (6) will be proved. Figures 1 and 2 are superimposed on one another to get Figure 5 with a bit of relabelling. The new diagram is self-explanatory once we recognise that OO_1 of Figure 5 = ra_1 of Figure 2. We have to show that OA/AB is greater than O_1A_1/A_1B_1 . Proof. Evidently, in Figure 5, angle $B_1O_1A_1$ is greater than angle BOA . Therefore, A_1B_1/O_1A_1 is greater than AB/OA . Hence, OA/AB is greater than O_1A_1/A_1B_1 . QED.

The reservation wage of a big landowner can be very high even infinity. So his v

is larger than v_0 . This proves (7). Curve ABCD in Figure 4 is drawn for a population of N where people are represented in a continuum along ON. The underlying logic for its shape is given above.

Transportation, Energy and Environment

A Case Study of Bangalore

B Sudhakara Reddy

Urban transportation in India is dominated by road transport where automobiles and trucks consume about 90 per cent of the total transportation energy out of which 80 per cent accounts for passenger transport. In Bangalore, an urban centre of South India, personal transport, particularly by two-wheelers, accounts for 60 per cent of total vehicle kilometres and their share in energy use accounts for 30 per cent of the total

This article, based on econometric analysis of annual data (1980-90), disaggregates passenger transport by vehicle type (two-wheelers, cars, buses, etc) and studies its impact on passenger kilometres and energy intensity. The study investigates the relation between transportation and energy consumption and its environmental impacts.

I Introduction

THE existing system of transport in any country greatly influences the economic and social status of its people. Development will always be slow where transportation is bad and inadequate. Indeed, poverty and immobility are closely related. Quick and efficient means of transportation has made our world smaller than that of our grandparents. In one way or the other, transportation has revolutionised our lives in the 20th century. A measure of development is the level and extensivity of transportation available. In poor countries, a vast amount of energy and time are spent in an effort to get things moved.

Transport is almost synonymous with energy. Even though commuting through efficient mode of transport reduced travel time, the demand for energy increased due to the spatial expansion of society. The conquest of distance by the destruction of time is fueled by the large increase in energy consumption. There is no doubt that transportation is the main root of our energy crisis. The current debates about global warming and ozone layer depletion are directly related to the consumption patterns of present generation. Automobile is the single largest cause of air-pollution which has serious effect upon the health of human and all other animals, plants and structures [1,2]. Even with all this negative impact, transportation has become indispensable in the life of man. Therefore, understanding these facts is essential from two standpoints. First of all, it should provide an insight into the impact of the increasing vehicle population on the energy consumption and environmental considerations. Also, it is important to study the technological alternatives to increase the efficiency of vehicles and substitute other forms of fuels. From this perspective, transportation, energy and environment and the emerging situations need a fresh look.

The present paper analyses some of the changes that had taken place in the past decade (1980-90) in the transportation sector of Bangalore, a fast growing metropolis of south India. Transportation accounts for nearly 50 per cent of total petroleum products consumed of which 90 per cent is for road transport [3]. The rapid growth in passenger vehicles, particularly two-wheelers (15.41 per cent p.a.) is partly due to the inadequacy of public transport, and partly due to substantial increase in the city's population. This not only increased the total fuel consumption, but also the number of passenger kilometres. The result is the increasing density of vehicles and the environmental pollution. The present study focuses on road transport where two-wheelers, three-wheelers, cars, and buses play a dominant role. The impact of energy use on passenger transport volume, modes

of transport, energy intensiveness of each mode and their environmental effects are discussed in this paper.

II Background Data and Information

Bangalore is the capital of Karnataka state in the southern part of India with a population of about four million (1991 census). The corporation of the city of Bangalore covers an area of 500 sq km and has a population density of 8,000 persons/sq km. Between 1981 and 1990, the population grew by about 8 per cent p.a. The major land use in Bangalore is residential (35 per cent), followed by transportation (20 per cent). The remaining land is used for commercial, industrial, and other purposes. The present and future patterns of the land usage indicate that between

FIGURE 1: COMMERCIAL ENERGY CONSUMPTION (1980-90)

1991 and 2000 AD, the share of residential, and commercial sectors will increase and those of transport and industrial sectors and parks will decrease (Table 1) [4]. These figures indicate that the land area provided for transport is inadequate and may not keep pace with the growth of traffic. Also, the increasing vehicle population and the encroachment of footpaths by street vendors have resulted in congestion of roads with the consequence of fall in traffic service. These traffic hurdles result in low travel speeds, frequent stops with the acceleration and deceleration of vehicles resulting in increased fuel consumption and exhaust pollution.

The transportation picture of Bangalore is characteristic of many metropolitan cities in India. In Bangalore, passenger road transportation is provided primarily by public transport and autorickshaws (three-wheelers) and private vehicles, viz., cars and two-wheelers. There is a predominant automobile traffic much of it involving daily work trips consisting mainly of buses

and two-wheelers. A fairly well developed Bangalore Transport Service (BTS) exists with its major fleet operating from Bangalore Bus Station, the centre of the city. There is no electric suburban system for mass transport, although there are periodic discussions on this subject. Many of the roads in the city are narrow. There

are a series of one-way streets in the city. There are many significant junctions in the city without any flyovers.

Generally, BTS operates its services mainly between 0600 and 2100 h. Many of the buses operate on fixed routes from points around the city centres and to suburban areas. Also, BTS operates Peak Hour Services (PHS) to some important industrial suburbs. There are pronounced peaks of person movements into and out of the city, i.e., 0800-1100 h and 1700-2000 h. Majority of the commuters are employees and working class categories belonging to the middle and low income groups. Higher salaried people use personal transport such as motor cycles and cars.

III Transportation 1981-90

The growth of Bangalore city has been phenomenal. It achieved 80 per cent population growth between 1971 and 1980 and 50 per cent between 1981 and 1990. The growth pattern indicates that, within the next few years, all of the satellite town centres will be a part of Bangalore. And, the Public Transport Service, BTS, is not keeping pace with the expansion. Between 1980 and 1990, its fleet strength was doubled from 820 to 1,675. Thus the number of vehicles/million of population increased only marginally, i.e., from 266 to 280 and the route km travelled

Sources: Primary data from Indian Oil Corporation, Bharat Petroleum Corporation, Hindustan Petroleum Corporation, and Indo-Burmian Petroleum Corporation.

FIGURE 2: PETROLEUM PRODUCTS CONSUMPTION (1980-90)

increased by 67.53 per cent (Table 2) [5]. Therefore, at present, the only solution for a Bangalorean who wants to reach his destination in time is to have access to a private vehicle, be it a two-wheeler or a car. That is why, private vehicle population increased by 300 per cent during the same period. Thus, personal transportation occupies a significant part of road transportation, thereby, increasing the per capita energy consumption. Thus, the use of automobiles and their fuel demands is central to a discussion of energy in transportation.

Data pertaining to the number of vehicles of different categories for a period of 10 years (1980-81 to 1989-90) was obtained from the office of the transport commissioner, Bangalore. It gives information on the number of vehicles of each category, viz., two-wheelers, autos, cars, jeeps, buses, trucks, etc. The information on the quantity of the consumption of petroleum products, i.e., petrol, diesel, fuel oil, light diesel oil, and kerosene was obtained from the offices of the oil corporations, viz., Indian Oil Corporation, Hindustan Petroleum Corporation,

Bharat Petroleum Corporation and Indo-Burman Petroleum Corporation.

IV Data Analysis

The consumption of commercial energy between 1980 and 1990 (Figure 1) indicates

that the shares of transport sector are high when compared to other energy carriers. In the case of petroleum products also, the transportation sector is the largest consumer and its share is increasing over the years (Figure 2). During 1989-90, Bangalore consumed 18519 TJ of energy, out of which 69.80 per cent went to the transport services and the remaining to the power generation and process heating. In the transport services, diesel, which is used by railways, buses and trucks, etc., is the main fuel accounting for 59.32 per cent of the total while the rest is met by petrol (Table 3). Between 1980 and 1990, the share of energy for transport sector increased from 46.3 to 49.5 per cent while that of industrial sector's decreased. No changes are noticed in the shares of residential and commercial sectors (Table 4).

Modern transport sector in most developing countries exhibits another predominant trend, viz., the major share is held by the road transport. The share of road transport which was 64.7 per cent during 1980-81 increased to 91.28 per cent in 1989-90, whereas railways show a corresponding decrease. The main reason for this may be the shift from coal to oil. The breakdown of fuel type by mode of transport provides an interesting glimpse of the variability in transport energy use pattern (Table 5). A study of the variation of the number of

FIGURE 3: GROWTH OF VEHICULAR POPULATION (1980-90)

different vehicles over time (i.e., from 1980-81 to 1989-90) shows that two-wheelers and cars have increased steadily with time while the increase in other types of vehicles is marginal (Figure 3). The variation of different categories of vehicles between 1980 and 1990 indicates that, during 1980-81, two-wheelers constituted 64.63 per cent of the total whereas they increased to 76.75 per cent during 1989-90. All other categories showed a declining share in the total. During the same period the average growth rate of vehicular population was 13.22 per cent (Table 6).

The growth of two-wheelers is remarkable after 1980. They achieved an average growth rate of 15.41 per cent per year during this period, certainly, the highest among developing countries [6]. During the same period, the growth rate of petrol consumption was 6.79 per cent (Table 7). In the case of diesel-driven vehicles (Table 8), trucks achieved an average of 8.18 per cent growth per annum while that of buses was only 5.11 per cent whereas the diesel consumption reported an average growth rate of 8.15 per cent per annum. The characteristics of different categories of vehicles (Table 9) shows that the fuel consumption (l/km) varies widely with the type of vehicle. It is 0.03 for a two-wheeler and 0.09 for a car. In the case of specific fuel consumption, it is 290 g/km for a two-wheeler and for a car the value is 182 g/km [7].

V

Vehicle Type and Energy Use

VEHICLE CENSUS APPROACH

The total petrol/diesel consumption discussed in this study does not reveal the contribution of various categories of vehicles to the total consumption.

Therefore, the effect of different categories of vehicles on the total consumption is an important parameter to find out. Instead of finding out these values by sample surveys, the vehicle-wise consumption can be estimated using statistical methods. This method can be referred to as vehicle census approach. Using this approach, the fuel consumed by different vehicles was estimated by regressing the average monthly fuel consumption on the number of vehicles in different categories. The form of equation to estimate the monthly fuel consumption of *i*th category of vehicles is:

$$Y_i = \beta_0 + \sum X_i \beta_i$$

where

X_i = number of vehicles of *i*th category

Y_i = consumption of fuel (kl/year)

β_i = average rate of fuel consumption per *i*th category of vehicle (kl/y)

The regression coefficients indicate the marginal increase in fuel consumption per

unit increase in the number of vehicles of the *i*th category. If the increase is linear, then the regression coefficient is also the average energy consumed per month through that category of vehicles.

The resulting equations are:

For petrol-driven vehicles

$$= 19030 + 0.1286 \text{ 2W} + 1.2256 \text{ 3W} + 0.4533 \text{ Car} \\ (0.06123) \quad (1.0927) \quad (0.3166) \\ + 0.6258 \text{ Jeep} + 2.8801 \text{ Taxi} \\ (0.3215) \quad (1.7235)$$

$$R^2 = 0.98$$

For diesel-driven vehicles

$$= 21306 + 15.4311 \text{ Bus} + 7.5411 \text{ Truck} \\ (7.024) \quad (2.15)$$

$$R^2 = 0.96$$

(Figures in parentheses are standard errors.)

The results (Table 10) show that on an average two-wheeler consumes 10.72 litres of petrol per month whereas a car consumes 37.7 litres. The high values of *t* indicate that the regression coefficients are not zero and there exists a relationship between the number of vehicles of different categories and the consumption of petroleum products. Using the fuel consumption per vehicle the total energy consumed per each category of vehicle is estimated. Two-wheelers consume 42.19 per cent of the total petrol whereas 26.29 per cent is used by cars. Trucks are the major consumers of diesel with 63.31 per cent followed by buses with 27.29 per cent. In the passenger transport, buses consume 33.42 per cent of the total followed by two-wheelers with 28.22 per cent (Table 11). As shown in Figure 4, trucks are the major consumers of petroleum products with 40.84 per cent of total consumption followed by buses with 17.7 per cent.

VEHICLE CATEGORY AND ENERGY USE

In this section, energy use is disaggregated into vehicle category use. In each category, energy use is expressed as the product of a level of activity and an energy intensity.

TABLE 8. GROWTH RATES OF MOTOR VEHICLES AND DIESEL CONSUMPTION (1980-90)

									8.15

FIGURE 4: SHARES OF DIFFERENT TRANSPORTATION MODES IN THE TOTAL ENERGY CONSUMPTION

For example, for automobiles, the activity selected is vehicle-km travelled and the energy intensity is then expressed as Joule/km. Total energy use is the sum of such products

$$E = VKM_i * (EI_i) \quad (2)$$

where

- i = Category of vehicle
- E = Total energy use (Joules)
- VKM = Vehicle kms
- EI = Energy Intensity (J/km)

Using this equation, the change in energy use over time is then decomposed into a change due to changed activity levels and a change due to changed energy intensities.

Energy consumption of any mode of transport depends mainly on its energy intensity, i.e. the inverse of efficiency (expressed as joules per passenger km). This index is not only related to fuel efficiency but also the use rate of modes (e.g. the loading rate of city buses) [8]. The energy intensity of any transportation mode

is calculated as:

$$EI_{ij} = \frac{F}{EF_{ij} * LF_{ij}} \quad (3)$$

where

- i = Category of transport
- j = Type of fuel
- EI = Energy intensity (J/passenger km)
- EF = Fuel efficiency (vehicle km/litre of fuel)
- LF = Loading factor (persons/vehicle)
- F = Energy content of the fuel (J/litre)

To calculate energy intensity, one should estimate the distance travelled per vehicle category and the estimation of per vehicular consumption of fuel. Table 12 shows vehicle kms and energy activity in detail for all modes of transportation during 1989-90. Two-wheelers accounted for the highest number of vehicle kms (53.3 per cent). In the case of passenger kms, between 1980 and 1990, two-wheelers achieved an annual growth rate of 25.96 per cent and their share in energy consumption increased from 16.71 to 29.66 per cent. During the same period,

the share of BTS buses decreased from 81.89 to 76.62 per cent for PKMs, and 45.92 to 35.12 per cent for energy use (Table 13). Figure 5 shows the shares of different vehicles in the total energy use.

The energy intensiveness for different transportation modes indicates the efficiency of any system. An average car has an energy intensity of 0.99 MJ/passenger km and a two-wheeler 0.72 MJ/passenger km. The BTS bus has an energy intensity of 0.16 MJ/passenger km (Table 14). This wide variation between different categories of vehicles is due to various factors such as energy consumption per km, average vehicle load, speed of the vehicle, etc. Even in the same category, there will be considerable variation depending upon the age, quality of the vehicle, traffic congestion, etc., which works against efficiency.

TRANSPORTATION AND ENERGY DEMAND

The structure of energy demand for road transportation can be studied as:

$$PTE_t = PKM_{it} * [(V_{it}) * (KM/V_{it}) / PKM_{it}] * [(E/VKM)_{it}] \quad (4)$$

(travel demand) (capital intensity of use) (energy intensity)

where

- t = Index for the year
- i = Index for the vehicle category
- j = Index for the fuel type
- PTE = Passenger Transport Energy Demand (GJ/year)
- P = Passengers travelled (no)
- KM/P = Intensity of transport demand (km/passenger)
- PKM = Passenger kilometres demanded = P * (KM/P) (km/year)
- V = Number of vehicles in operation
- KM/V = Intensity of vehicle use (km/vehicle)
- VKM = Annual vehicle kilometres
- E = Energy consumed (GJ)
- E/PKM = Energy intensity factor (GJ/PKM)

Using equation (4), the energy demand, PTE, can be disaggregated into different factors

FIGURE 5: SHARES OF DIFFERENT TRANSPORTATION MODES IN THE TOTAL VEHICLE KILOMETRES

The first factor, V , is the number of vehicles. With increasing incomes and availability of vehicles on loan/lease, the rate of growth of vehicle population increased rapidly over the years. Average number of two-wheelers per family was 0.185 during 1981 which increased to 0.45 in 1990 [9]. This indicates that one out of every two households in Bangalore possesses a two-wheeler. The respective figures for cars are 0.05 and 0.08. This is because, with increasing urbanisation, the need and the demand for passenger transport increases simultaneously. Also, with increasing population, the number of people travelling increases, thereby increasing the number of vehicles. Thus, with increasing urbanisation, and population, not only the P_{ij} increases with respect to t , but the proportion of P_{ij} allocated among different categories of j changes with respect to the growth rate of population, availability of vehicles, income of the population, rate of urbanisation, and the relative transport fuel prices.

The second factor, km/V , is the average run per vehicle per year. These values are 4,530 km/year for car and 3,860 km/year for two-wheeler. With almost explosive growth of urban centres, the distance between the home and work place increases, thereby increasing the distance travelled.

The last factor to be considered, E , is the fuel consumption. This depends on the efficiency of the mode of transport which can be measured by the energy input required to transport passengers to a given unit of distance. Thus, the efficiency of a vehicle can be defined in terms of $(E/VKM)_{ij}$, or the product value of load factor $(VKM/PKM)_{ij}$ and the energy intensity of a vehicle can be defined through $(E/PKM)_{ij}$. For a stated vehicle energy intensity, energy efficiency

can be maximised if the vehicle is operated at 100 per cent passenger capacity. Thus when a private car is driven by one person or when the public transport buses run without the full capacity, the energy intensity per passenger km increases. At present norms, the energy intensity of a car

is 0.99 MJ/PKM whereas for a two-wheeler, it is 0.72 MJ/PKM and for a bus 0.16 MJ/PKM. With the introduction of fuel efficient two-wheelers and cars, the consumption per vehicle seems to have come down. However, this fact is yet to be tested.

As the above results show, in the near future, two factors play an important role in the reduction of energy demand and one factor contributes to its acceleration. The former are improvements in the efficiency of the vehicle engine and less average run per vehicle and the latter is an increase in the total number of vehicles

VEHICLE ELASTICITY

Vehicle elasticity is an important factor in determining the impact of vehicle penetration in the future. The elasticity of a particular category of vehicle can be defined as the rate of change in total consumption of energy with respect to its percentage penetration. This can be given by the equation:

$$\eta = \frac{\Delta X_{ij} \cdot \beta_i}{\Delta Y_i} \quad (5)$$

Y_i = fuel consumption of i th category of vehicle (kl/year)

X_{ij} = number of vehicles in the i th category using j th fuel

β_i = average fuel consumption of i th category of vehicle (kl/year)

η = vehicle elasticity.

TABLE 10: PER VEHICLE CONSUMPTION OF PETROLEUM PRODUCTS

Fuel Type	Vehicle Type	Regression Coefficient	t-value	Per Vehicle Consumption (l/m)

Total	4086 (100.00)	7349 (100.00)	5963 (100.00)	5350 (100.00)	11252	100.00

Note: Figures in parenthesis represent percentages

FIGURE 6: CO EMISSIONS THROUGH DIFFERENT TRANSPORTATION MODES

This η is considered as the index representing the consumption-penetration relationship. It is dimensionless and lies between zero and one. Elasticity of zero implies that the total fuel consumption is not affected by the i th vehicle whereas elasticity of one implies that the total fuel consumption is affected only by the i th vehicle category.

The value of η in the equation (5) indicates that a one-point increase in the penetration of a vehicle category results in certain percentage increase in petrol usage. For example, in the case of two-wheelers, the consumption of petrol per annum is 128.64 litres and the vehicle penetration is 0.5023. Hence, the two-wheeler elasticity of petrol consumption is 0.47 which means that with a one percentage increase in the penetration of two-wheelers results in a 0.47 per cent change in the consumption of petrol. Table 15 contains the elasticities of different vehicle categories. On this basis, a 1 per cent increase in the penetration of two-wheelers can be estimated to lead to an increase in Bangalore's petrol consumption to 387.90 kl per year. Similar calculations have been carried out to estimate the effects on petrol and diesel consumption of increase in the penetration of other vehicles (Table 16).

INTERDEPENDENCE

The interdependence of one vehicle on the other is an important factor that must be given due consideration. A ratio of one type of vehicle to the other can be formulated as given in Table 17. For example, the ratio of the number of cars to the number of two-wheelers decreased even though there is an individual increase. In the case of cars to

auto, and two-wheelers to auto, the ratio increases. This indicates that two-wheelers are increasing fast when compared to other categories of vehicles. In the case of public

transport service (BTS), the ratio is decreasing with all other categories of vehicles indicating that it is not keeping pace with others.

VI Discussion

IMPACT ON ENVIRONMENT

Vehicles emit carbon monoxide, unburnt hydrocarbons, nitrogen oxide and sulphur dioxide which pollute the environment thereby causing serious damage to the health of human and other living things. In this study, an attempt was made to estimate the emissions through various vehicle categories based on the emission measurements carried out by Pundir and Sudhakar [10].

The contribution of various categories of vehicles to the air pollution is given in Table 18. An important observation from these figures is that the contribution of two-wheelers to the total emissions is very high for carbon monoxide and hydrocarbons. For 1989-90, the total CO emissions were 33,043 tonnes in which the contribution of two-wheelers and cars were

FIGURE 7: HC EMISSIONS THROUGH DIFFERENT TRANSPORTATION MODES

38 and 21.5 per cent respectively. In the case of HC, the estimated emissions were 14,296 tonnes in which the share of two-wheelers is around 54 per cent. Diesel-driven vehicles are the major contributors of NO (90 per cent of total). Figures 6 and 7 show the contribution of emissions for different categories of vehicles and Figure 8 gives detailed information on the relative impact of different modes of transport on energy consumption and environment.

As the results suggest the quantity of emissions particularly by two-wheelers is alarming. And in the coming years, the figures will increase further due to increase in the vehicle population. Unless steps are taken to reduce emissions, there will be a serious damage to the environment. Some fundamental approaches to the fuel economy improvement enable percentage emission reductions, e.g. in an efficient engine, the combustion temperature lowers reducing NOx formation. Also, the increase in unburnt hydrocarbons, with air to fuel ratio, can be prevented, by improving ignition and can be mitigated by improved exhaust after-treatment [11].

Also, in the long run, vehicle-emission standards should be formulated on the basis of pollutants emitted by different categories of vehicles under actual driving conditions. Necessary test procedures should be developed and the requisite facilities should be established. Assessment of present engine technology, monitoring air quality and establishment of laboratories for vehicle certification for emissions should be made obligatory.

Actually, automobiles pollute in several ways and control of engine emissions deals with but one of these. For example an auto tyre reduces its weight by about 1/3 kg less every year, the loss being in the form of rubber dust abraded away against the road. Thus, each road vehicle contributes some 1/3 kg of rubber dust to the ambient each year. While there has been no definite study of the flow and ultimate end of this pollutant, it can be assumed that a portion of it goes into the air we breathe while some is washed down to earth - perhaps to pollute the drinking water [12].

Asbestos dust is one of the known, identified carcinogens. Every time an automobile's pedal is pressed, asbestos dust is put into the atmosphere. Autobraking linings are made up of asbestos, and in the course of converting the machine's kinetic energy into heat, these linings are converted into asbestos dust.

IMPACT ON LAND RESOURCES

In the case of transport, another serious waste related to auto and taxi use is that of land resources which necessitates large amounts of valuable land for the movement and parking of vehicles. In Bangalore, the availability of the land for transport is limited (20 per cent of total, including parking space) and it is not possible to expand it because the living areas are densified, thus permitting the services to be available with minimum travel requirements. Also, the cost of building and maintaining the streets, roads and highways, cleaning them, providing them with light and traffic signals, etc. is no way related to the direct users' willingness and ability to pay. Thus the question is whether to invest in the increase of transportation facilities like construction of more roads, increasing the number of operations per vehicle, etc., or utilise the existing infrastructure more efficiently.

IMPACT ON ENERGY

The consumption of energy in transporting people is only a part of the total energy consumption. Vehicles account for significant energy consumption in their manufacture and transport, extraction and processing of raw materials required for their manufacture. Similarly, the construction and maintenance of roads consume energy.

TABLE 15. VEHICLE ELASTICITIES

FIGURE 8: IMPACT OF DIFFERENT TRANSPORTATION MODES ON ENERGY CONSUMPTION AND ENVIRONMENT

DEMAND SIDE MANAGEMENT

The solution for solving transportation problems should be seen in terms of technological, and policy perspectives. They are:

Technological

(a) Fuel economy. Since 80 per cent of transport energy is through two-wheelers and cars, a shift to small cars and to lighter two-wheelers, which are fuel economic, could save significant quantities of fuel. In this direction, the major fuel economy improvements in the past decade are:

(i) Propulsion system efficiency: Engineering improvements give 36 per cent increase in power/unit of engine size.

(ii) Vehicle design: Improved design and use of new materials, the ratio of weight to interior volume of vehicles has been reduced, thereby reducing the fuel consumption.

(ii) Trade-offs. Trade-offs among the performance, emissions, cost, safety and fuel economy have been used by the manufacturers in meeting this.

(b) Alternative fuels: In Bangalore, 90 per cent of the total transport energy is through road vehicles. Thus, there is a clear need to reduce the energy for road transport which

depends on oil-based fuels and this requires changes to engine/motor technology. The most promising alternative technologies appear to be Compressed Natural Gas (CNG) and electric motors.

(i) CNG: CNG is obtained by compressing gas to 2300-2600 psi. This is most suited for the vehicles with high mileages and restricted range of operations such as buses and taxis, and thus urban areas are most suited for CNG operations [13,14].

(ii) Electric vehicles: Electric vehicles require a wire feed or heavy batteries to provide power. Because wayside connections are not feasible for most vehicles, electric vehicles can be battery powered. Improved battery vehicles will result in traffic compatible vehicles capable of limited application such as in urban areas [15].

TABLE 19: REDUCTION IN ENERGY USE (MJ) FROM SHIFTING ONE MODE OF TRANSPORT TO ANOTHER THROUGH ONE PKM

Change in Mode of Transport	Energy Intensity (MJ/PKM)		Saving (MJ)
	One Mode	Another Mode	
Two-wheeler to bus	0.72	0.16	0.56
Three-wheeler to bus	0.82	0.16	0.66
Car to bus	0.99	0.16	0.83

1989-90	401811	15591	71078	2218	4215	0.039	0.177	0.006	0.010	0.219	0.270	0.059

(c) Communications: The improvement in electronic communications will reduce travel need of the people. Many financial transactions which require sheets of paper to be transported can be done more quickly using the improved telecommunication systems. Remote work stations, armchair shopping, train/air reservations, tele-conferences, etc., allow the user to avoid physical travel.

To develop and exploit technological opportunities to further reduce fuel consumption, it would be valuable to strengthen technological policies (such as R and D programmes) as well as to enact still more effective air pollution standards. In designing more effective standards, greater attention should be paid to (a) fuel economy-emission interaction and (b) non-standard situations. Also taxes and rebates based on emission performance might be effective.

Policy Formulations

(a) Planning: Transport planning policies offer greater scope for reducing energy consumption. Since the two-wheelers and cars consume 50 per cent of total energy for passenger transport, shifting of modes of transport from two-wheelers/cars to buses could save energy. If one passenger km is shifted from a high energy intensity mode to low one, the savings will vary from 0.49 to 1.32 MJ (Table 19). Also, the long-awaited rail transit system is urgently needed since the present bus system cannot sustain the increasing load. Land planning is also an important factor to be considered.

(b) Pricing: Generally, fuel price increase would motivate fuel economy, but, as the recent trends suggest, the effect is not thought to be strong. It has been estimated that price elasticity is -0.5 for the new fuel efficient vehicles [16]. That is, for every 10 per cent increase in fuel price, the average buyer would opt for a vehicle with 5 per cent higher fuel economy.

Therefore, alternative pricing strategies should be given importance. This should go further than just road pricing. There should be ecological taxation reform which shifts the present taxation burden progressively over a 30-year period away from income tax. This should penalise those activities which consume space, energy and create pollution leading to ecological and environmental degradation. If applied, these policies can steer the economy towards a state which encourages environmentally friendly activities and discourages the opposite.

VII Conclusions

In Bangalore, transportation energy particularly by road vehicles constitutes nearly 90 per cent of total energy consumption

out of which 80 per cent is through passenger transport. Between 1980 and 1990, there was a significant growth in personal transport, particularly by two-wheelers (15.41 per cent p.a.) which accounted for 60 per cent total vehicle kilometres. In energy use the share of two-wheelers and cars was around 25 per cent of the total. This growth in personal transport, which has a high energy intensity, will increase energy consumption. As our results suggest, the energy intensities of each mode of travel could have a significant impact on energy use. Also the environmental impacts of transport are significant.

Since the economic growth, technological advancement and transportation are inter-related, the increase in transportation's share of energy will be quite high in the coming years. As the vehicle elasticity results indicate, a one percentage point increase in two-wheeler population results in 0.47 per cent increase in petrol consumption. Thus, with increasing use of transport services, the level of energy consumption, and thereby, the atmospheric pollution increases. This poses a major environmental dilemma.

If there is an increase in petroleum prices, the level of travel may decrease, thereby decreasing the energy intensities of each transportation mode. However, with increasing incomes, personal transport will increase and so also the per capita energy consumption. Thus, the impact of growing volume of personal vehicles more than offset the impact of reduced energy intensities. Modal shifts to less energy intensive modes (from two-wheeler to bus) could contribute to energy savings. To achieve this, the government should make the public transport bus system more efficient and also consider seriously about the rail transit system. Pricing of transport services based on some sort of bus operating index, incentives for economic operations, fuel conservation, punctuality, etc., will improve the performance of BTS. Also, the introduction of point to point travel by public transport, education on conservation of fuel, etc., are important factors to be considered. Fuel-efficient vehicles should be encouraged with some incentives in the form of tax concession, etc. Also, the environmental consequences of transportation should be given importance while framing transportation policies.

Since the economy of a country depends to a major extent on energy, particularly from liquid fuels, the availability and advancement of alternative technologies like electric vehicles, CNG, methanol, etc., for transportation should be investigated.

A developing country like India cannot afford to neglect the development of an efficient transportation system.

[The author wishes to thank Amulya K N Reddy, president, International Energy Initiative for providing valuable suggestions.]

Dalit Protest Literature in Telugu

A Historical Perspective

A Satyanarayana

Although there was no literary genre distinctively known as 'dalit literature' during the pre-independence period in Andhra, an examination of the literary works of certain dalit intellectuals indicates that the agony and anger of the dalit masses are reflected in their writings. This paper analyses the nature of literary representation of dalit problems and the emerging consciousness in the writings of selected dalit scholars.

THE objective of this paper is to discuss the historical context of the emergence of a literary genre which reflected the growing identity, awareness and consciousness of the dalits during the colonial period. Although there was no literary genre distinctively known as 'dalit literature' during the pre-independence period in Andhra, an examination of the literary works, i.e. poems, novels, plays, etc. of certain dalit intellectuals indicates that the oppression, agony and anger of the dalit masses is reflected in their writings. An attempt is made in this paper to analyse the nature of literary representation of dalit problems and the emerging consciousness in the writings of selected dalit scholars. It focuses on the treatment of caste oppression, untouchability and dalit sensibility in the writings of dalit intellectuals.

In recent years the socio-cultural and political assertion of the oppressed masses belonging to the lower sections—the dalits—has been accompanied by a distinct literary genre called dalit literature. It is noted that "the distinctiveness of dalit literature lies in its authentic unity of language and content. In it the disillusionment and disgust of young dalits, often accompanied by a desire of revenge, come alive. It revives the memory of the pain and suffering of past generations. It confronts centuries of hypocrisy, deceit and violence sustained in the name of tradition".¹ In Andhra Pradesh, the Karamchedu episode² marks a turning point in the growth of the dalit movement. A series of upper caste attacks on the dalits in different parts of the state resulted in the formation of various organisations of dalits, which are presently channelling the assertion and political articulation of the dalit masses. A wide variety of political formations, cultural organisations and ideologies (ranging from liberal bourgeois to radical marxist) represent the growing consciousness of the dalits in the state.

Broadly speaking, since the 1970s an increasing number of poets and writers drawn from the dalit communities of the states of Maharashtra, Karnataka, Andhra Pradesh, etc. have been producing literary works such as poems, short stories, novels and dramas representing the themes of caste oppression, untouchability, poverty, repression and revolution. The writings of dalit scholars

also contain powerful denunciations of and fierce attacks on the caste system and on brahmanical Hinduism. It has been pointed out that the dalit Sahitya is considered to be a unique genre of modern Indian literature, for now untouchables themselves using the traditionally-denied weapon of literacy, are exposing the conditions under which they have lived, as well as directly rebelling ('vidroha') against the Hindu institution which has assured their perpetual subordination to the Varna order.³ As far as Andhra Pradesh is concerned, it can be said that both the radical left movement and the Dalit Maha Sabhas have thrown up a new generation of dalit scholars, intellectuals and philosophers whose writings sharply reflect the changing perceptions and consciousness of the dalit masses. In their writings the dalit question is posed in terms of the annihilation of the caste system and the building up of a casteless egalitarian society.

HISTORICAL ANTECEDENTS

However, the emergence of dalit literature in recent times is not without its historical antecedents. In fact, since the medieval period the Telugu-speaking region of the Deccan witnessed the development of the bhakti movement, which led to the emergence of a literary tradition among the non-brahman scholars, Vemana, Potluri Veerabrahman et al., which propounded anti-caste movements and denounced the caste system, social inequality and oppression. The saint-poets emphasised in unequivocal terms the inequalities and injustices suffered by the lower and untouchable castes due to the varna order. The medieval bhakti tradition, therefore, first raised certain themes and issues regarding the life and sufferings of those at the bottom of the caste hierarchy. By and large, the themes of the bhakti tradition reappear in the dalit literary tradition both during and after independence, even though the perspectives of the two traditions is different.

In Telugu literature the problems of untouchability and the poverty and misery of dalits were represented by nationalist and liberal scholars drawn from the upper castes.⁴ In particular, the literature which was generated during the time of social reform movements contained various problems

confronted by different segments of society. Social reformers such as Gurajada Appa Rao and Veereshalingam broadened the base and scope of literature as well as transformed the traditional character of Telugu literature "into a modern tool of communication".⁵ In contrast to the conservative elitist literary tradition, modern writers such as Appa Rao and Gidugu Ramamurthy favoured and popularised the use of spoken language in literary creation. Though Gurajada and Veereshalingam are acclaimed, as the 'founders of new epoch in modern Telugu literature', their writings focused mainly on themes and problems such as brideprice, widow remarriage, etc. related to women of upper castes, mainly brahmins. Neither *Kanyasulkam* (Bride Price) nor *Raja Sekhara Charitram*, written by Appa Rao and Veereshalingam respectively, addressed the basic, fundamental problem of caste oppression and alienation of dalit masses from the mainstream society. This does not mean that their contribution to social reform is negligible, yet strangely problems central to the varna system escaped their attention. While they sought to reform certain evils of the Hindu social system, they failed to grapple with the ideological and institutional framework of brahmanical Hinduism. Their reading of classical texts and scriptures was only aimed at reforming some aspects of Hindu society, but not to question and negate the varna system itself.

Thus the social reformers of modern Andhra did not inherit and continue the medieval bhakti tradition, it was discontinued. This discontinuation was possible perhaps because the fact that unlike the bhakti saint-poets, the social reformers compromised with the existing social order. Also, given their social background and intellectual and cultural tradition, they could not profess anti-feudal and anti-colonial/caste ideology and consciousness. Unlike the saint-poets they did not revolt against all kinds of social evils. They were selective in their philosophical and ideological standpoint. In this sense the modern social reformers failed to generate and build up a popular cultural and ideological movement against the caste system.⁶

Nevertheless the nationalist literature generated since the time of the

Vandemataram movement reflected the problem of the dalit masses, though to a limited extent. It was put to both social and political use. The Gandhian movement inspired a number of scholars who argued that national liberation will herald a new epoch in which discrimination and oppression of all sorts will be abolished. In order to build a united and coherent anti-colonial movement, they exhorted the people through their writings to eradicate social evils and unite. In this context novels such as Unnava Laxinarayana's *Malapalli* (1922, 'Harijan Hamlet') and Ranga's *Haryana Nayakudu* (1933) are socially significant literary works. Both of them depicted the problem of untouchability and the misery of dalits, but they suggested that with certain changes and modifications, the existing caste system could be maintained. The solution to the dalit problem is offered within the existing framework of the caste system. In a sense, it was not truly a realistic representation of the dalit question. Therefore, in the writings of non-dalit scholars the problems of untouchability and caste discrimination was reflected not as a serious and fundamental one. They advocated minor reforms and adjustments, yet favoured continuation of the existing unequal social hierarchy. For them the dalit masses became an object of pity and sympathy. The nationalist intelligentsia, which was isolated and distanced from the dalit masses, failed to fully grasp and comprehend the oppression and discrimination faced by the dalit masses in their everyday life. Though they were inspired by the ideology of nationalism, they were insensitive to the socio-cultural and economic oppression of the dalit communities. The aspirations and emotional feelings of the dalit masses were not adequately taken cognisance of by the middle class intellectuals, who were predominantly drawn from the upper castes. It was precisely for this reason that the Gandhian programme of 'Harijan upliftment' was a failure. A dalit poet ridiculed the commitment of pseudo-Gandhian upper caste activists towards the upliftment of untouchables. He wrote:

You prove that you are the descendants of
sages
Outwardly you call us brothers
You boast to have listened to the teachings
of Gandhi
Nobody follows (him), is not it injustice
You forget the words of Mahatma Gandhi
You burn with anger at the untouchables?

The constructive programme (harijan upliftment, temple entry, etc) of Gandhi was popularised in Andhra with a view to integrate the dalit masses into the fold of the mainstream nationalist movement. The socio-political programme of Gandhi was not fully realised due to the alienation of the dalit communities. For them (dalits) the

nationalist appeal was meaningless insofar as it did not incorporate their sufferings, emotions and aspirations. Thus a dalit poet opined, "Equality is Swaraj".

However, if the nationalist literature of the 1920s partially reflected the dalit question, the progressive literary tradition of the 1930s and 1940s was no better either. Undoubtedly the progressive writers who were guided by the philosophy and ideology of Marxism⁸ propounded the building up of a classless society. The marxist literary and cultural movement became a powerful social force. But the basic flaw in this literary tradition was that it did not adequately take note of different kinds of non-class exploitation such as by caste, gender, ethnic group, religion, etc, which existed in society. Class struggle and class oppression were seen as universal laws. As Ambedkar pointed out, marxist scholars in India failed to adequately understand and comprehend the caste-specific character of Indian society.⁹ Though the progressive writers guided by a socialist perspective pleaded for socio-economic justice, their writings did not reflect caste oppression and discrimination to the extent that it deserved. Attacks on the caste system, abolition of caste oppression, social equality and self-respect of the dalit masses were not the themes which characterised their writings. Barring a few, a majority of the progressive writers were drawn from the upper 'savarna' castes. Thus just as their predecessors (i.e. the nationalist intelligentsia of the 1920s) did, the progressive writers tended to address the problems confronted by the middle classes and advocated piecemeal social reform.¹⁰ It has been noted by a literary critic that the progressive writers association was dominated by middle class intellectuals mostly drawn from the non-dalit upper castes. He wrote, "the progressive literature was mainly created by middle class youth who were influenced by the Communist movement. In actuality the progressive literature did not go beneath the middle class readers".¹¹ Another scholar remarked: "...the literary activities of the PWA which were... confined primarily to middle class intellectuals, and also, to some extent, to the literate and marginally to a few people from lower middle and middle and poor peasants and working class sections. By and large, the major sections of lower order were left out of its impact."¹² It was so because "all those drawn into the PWA were not a part of the Communist Party cadre. Some of them were fellow travellers and some were not even that."¹³ It was no wonder that many scholars and intellectuals of dalit background were not a part of this progressive literary tradition. At the political level also, the Communist party failed to integrate the vast majority of the dalit masses into the larger struggle for liberation.

An examination of the nature of social participation in the freedom struggle in Andhra indicates that there was no considerable participation of the dalit masses in it. It was mainly due to the fact that economically and educationally advanced upper caste groups dominated the Congress. Social inequality, caste discrimination, illiteracy, poverty, etc, kept the dalit communities away from the mainstream nationalist struggle, at least until the 1930s. The ideology of nationalism did not inspire them as they were subjected to severe socio-cultural discrimination and oppression by the same upper caste forces which championed and led the anti-colonial national movement. The upper caste leadership also failed to evolve a programme and perspective of socio-cultural emancipation of the dalits. Hence they distanced themselves from the liberation struggle. The Gandhian programme and technique also did not completely succeed in integrating them into the fold of the freedom struggle. The aspirations and emotional feelings of the dalit masses did not become an integral part of the nationalist ideology and programme. The nationalist literary and cultural tradition denied a legitimate place and role for them. Thus the political and socio-cultural assertion of the dalit masses developed independently and outside the organisational framework of the Congress Party.

In Andhra, the struggle for emancipation of dalits from the clutches of upper caste domination and for achieving social equality was launched by the Adi-Andhra Mahasabha. Its first conference was held at Bezwada on November 4-6, 1917, under the presidency of Bhagya Reddi Varma. It was the beginning of dalit self-mobilisation for self-respect and social equality. A series of Adi-Andhra conferences were held between 1917 and 1938 in different parts of Andhra, which helped in the mobilisation of the dalit masses in their struggle for social justice.¹⁴ The educated and enlightened sections within the dalit communities provided the direction, programme and leadership for the movement. Persons such as Bhagya Reddi Varma, Sundu Venkiah, Kusuma Dharmanna, Vemula Kurmaiah, et al, provided leadership for the dalit movement. The basic thrust of the movement was to critique the ideology of brahmanical Hinduism and counter the socio-cultural hegemony of the upper castes. It also sought to organise the dalit masses for achieving socio-economic and political equality. The main item in the agenda of the movement was abolition of untouchability, caste oppression and discrimination. The counter-cultural movement and ideology propagated by dalit intellectuals contained a critique and negation of brahmanical Hinduism and undermining of the cultural

tradition of caste Hindus. These aspects were well-represented in the literary and cultural traditions of the dalits in the 1930s and 1940s. The literary, cultural and ideological articulation of dalit identity and sensibility was projected by the first generation of dalit intellectuals. They were the products of western education, which was made available to them by Christian missionaries and the Brahmo Samaj. The spread of education (though limited) during the first quarter of this century among dalit communities was possible due to the prolonged activities of missionaries in coastal Andhra. Therefore, the Krishna, Godavari and Guntur districts witnessed the active movement of the Adi-Andhra Mahasabha. The dalit literary and cultural tradition was also established in Coastal Andhra. Below a random survey of the writings of dalit scholars is undertaken, with special reference to the literary works of Gurram Jashuva, Bhoi Bheemanna, Kusuma Dharmanna, and Bhagya Reddi Varma.

In an effort to create solidarity and identity among the dalit masses, Bhagya Reddi Varma asserted that the so-called untouchables were never a part and parcel of caste Hindu (Aryan) society.¹⁴ He criticised the Aryan gods such as Rama who perpetrated injustices and atrocities on shudras and dalits. He went on to suggest a break from Hindu tradition and religion as the primary necessity for putting an end to the plight of the dalit communities as well as to maintain their separate identity. He stressed that dalits were the original inhabitants of the land ('sons of the soil') and called themselves the 'Adi-Andhras'. This term was coined and consciously put to use to denote unity of the dalits. He opposed and rejected the derogatory term 'panchamas' used by the upper castes. Maha kavi Gurram Jashuva questioned the creation of the panchama varna. He also questioned the wisdom of the upper caste Hindus in treating the dalit masses as panchamas/outcastes.¹⁵ His poem reads.

We heard that for the old Brahma
Born Four Sons
The wretched lower than the animal
Who is this Fifth Caste person?
Savithri! (Mother)

The Adi-Andhra Mahasabha demanded that the government designate the dalits as Adi-Andhras and this was conceded. Similarly Bhoi Bheemanna coined another term MaMas which indicated the two main sub-castes within the dalits (Ma = Mala; Ma = Madiga). This term was deliberately used by him to foster the concept of unity among the dalit communities.¹⁷ Jashuva was critical of sub-caste rivalry among dalit communities. He felt that ignorance was the main reason for this.

In addition to these terms the dalit writers also traced the common ancestry of dalit communities. They claimed that they are

the children of 'Matangi Kanya' and the descendants of Arundhati. In his drama *Ragavashistham*, Bheemanna offered a critique of the brahmanical interpretation of the origin and status of dalits. It is intended to reject the brahmanical reading of certain Hindu classical texts. It is also a negation of the brahmanical view which attributes the lowest and meanest birth to the untouchable castes. The marital relationship between Arundhati (the Matangi girl) and Vasista (the brahmin sage) is interpreted by Bheemanna to claim the highest social status for the dalits. The message conveyed through this drama is that the dalits are not the outcastes and that they have a legitimate claim for the higher social status and prestige/privilege enjoyed by the caste Hindus. Jala Ranga Swamy, in a long poem entitled 'Who are the untouchables', criticised the upper caste Hindus for caste discrimination and asserted the rights of dalits to social equality. He reasoned that the so-called panchamas were the original people ('anaryas') of Telugu country. The Aryan invaders defeated the anarya rulers and subjugated them. Further, the Aryan conquerors imposed their rule and culture on the anaryas. The latter were oppressed, discriminated against and relegated for slavery (out-caste). The poem reads:

Some occupations were created and assigned to us
We were named as serfs
Caste discrimination was introduced, we were suppressed
We were troubled with slavery/serfdom
Occupational difference were imposed, we were alienated¹⁸

While denouncing the Aryan conquest, which led to the enslavement of the dalits, the poet (Ranga Swamy) proclaimed the glory of their (anaryas) past by claiming the great sages and pious/chaste women of the ancient times. The poem is as follows:

The great warriors of Puranas were our people
Vashistha, Valmiki etc, belonged to our dynasty
Vedavyasa, Parasara were our people
Hahuman, Sugreeva were our brothers...
Did not the great mothers of Heros born amongst us
Did not they observe chastity
Is not Arundhati, the daughter of our caste
Sabari, Matangi were our women...
A caste in which such great people were born being alienated
We were made lowly people, excommunicated¹⁹

Bhoi Bheemanna pleaded for social equality. He wrote:

Around the neck of the powerful Indian Nation
Caste, Religion are the hangman's ropes...
Destroy the guile of caste and religion
Eradicate the human inequalities²⁰

The most forceful attack on upper caste Hindus, who are said to be responsible for the perpetuation of caste discrimination and excommunication of the dalit masses, was launched by Kusuma Dharmanna. He was a bitter critic of brahmanical Hinduism. In his long poem, 'we do not want the rule of black landlords', he portrayed the miserable and pathetic living conditions of the dalit masses. He wrote:

(We have) only small huts outside the village
We do not have big houses
An, light do not trifle
(We have) no delicious food, curry
To wear (we have) no Saree. Loin cloth
(We have) no tail, ornaments
(We have) no land to plough, eat food
(You have) no sympathy on our poverty²¹

The claim for social equality was widely propagated by the Adi-Andhra Mahasabha through its resolutions and demands for the use of public wells, educational institutions, temples, etc. by the dalits. The aspirations of the dalit masses for social equality was negated and vehemently opposed by the arrogant upper castes, and many a time the dalits were subjected to physical attacks and reprisals. In the Andhra countryside a number of violent incidents occurred in the 1930s and 1940s when the dalit communities persisted in their struggle for equality and self-respect. A few instances will suffice to make this point clear. In Gajularega village (Vizagapatam district) a newly married dalit couple were taken in a procession on horseback through the main streets of the village, in Mangalagunta (Chittoor district), dalits walked in the streets wearing footwear; in Eluru (west Godavari), dalits took out a religious procession on a festival day through the same street which was used by the upper castes; a dalit disciple worshipped the goddess Aluvolu Manga (wife of Lord Venkateswara) in Tirupati for which a case was foisted against him.²² These acts by the dalit masses enraged the upper castes in the respective villages and resulted in physical attacks on them. Such assaults from the caste Hindus helped in strengthening the feeling of their distinct identity. Thus caste oppression and discrimination became the central themes in the writings of dalit scholars. In particular, Kusuma Dharmanna in his writings and speeches (inaugural address to the Dalit Mahasabha Conference, Vizianagaram, 1936) exposed the false, hypocritical and cunning nature of Hinduism and ridiculed the brahmanical double-standards. He freely quoted verses from the works of the medieval saint-poets/scholars such as Vemana and Veerabrahman to denounce the unequal and inhuman Hindu social order.²³ He appealed to the dalit masses to unite and fight for socialism. He felt that it was through achieving social equality alone

that the dalit masses could hope for a decent living and self-respect. By socialism ('samyavadam') he meant "a society where there will be no distinctions based on caste, religion, rich and poor. A society in which there will be no place for discrimination and internal rivalry."

The urge for dignified living, self-respect and social equality is powerfully presented in the works of Jashuva and Bheemanna. Jashuva, a great creative poet and a literary genius of the modern times, was humiliated and subjected to intense mental agony by the inhuman caste system as well as by arrogant and casteist scholars. He was treated as a literary outcaste by the scholarly world which was dominated by the upper castes, mainly the brahmins. His creative genius, merit and literary talent were not recognised and encouraged because of his low birth and dalit background. But he was not a coward. He resisted and exposed the cruelty of caste oppression through his pen. He said, "Life taught me many lessons. I have two teachers (Gurus) - poverty and Caste/Religious discrimination. If one taught me patience, the other one increased my power to resist. But did not convert me as a slave. I intend to pierce through caste distinction, poverty and prove that I am a human being. I wield a sword. My sword is my poetry. It has no hatred against the society as such. But hatred on its policy."²⁴ In the poetry of Jashuva the anger, agony, disgust, misery and the daily bitter experiences of the dalit masses/communities is most authentically and realistically represented. His famous poetical works, 'The Bat', 'The Orphan', etc., indirectly mirror the bitter experiences and stark realities of his personal life. It is noted that 'The Bat' graphically reflects his growing resistance consciousness and longing for better human values. In it he posed a number of questions to Hindu society, religion and culture which is responsible for the perpetration of untouchability. 'The Bat' is the first poetical work in which a dalit is the hero. The poet speaks through him. It depicts the miserable life and sufferings of the dalit masses:

When his (Dalit's) hands do not work
The green fields hesitate to yield crops
He sweats, provides food for the world
But he himself has no food.²⁵

The material condition of the dalit masses who worked as agricultural labour is revealed in such poems. He ridiculed the brahmins who treat the dalits as untouchables but use the food-grains produced by them as offerings to the gods in the temples; when they (the dalits) do not produce food the gods will go hungry.

By swallowing the blood of the
wretched (dalit)
Lives the iron ankleted Mother
Upon smelling his air hisses with vengeance
The four-hood Hindu Cobra

This poem is a reflection of how the poisonous snake called Hinduism perpetuates oppression of dalits by savarnas.

Jashuva wrote his bitter and moving poetry at a time when the dalit masses were launching struggles for self-respect, independently and outside the framework of both the Congress and left parties. Bhoi Bheemanna captured the intensity and essence of struggles of the dalits for achieving socio-economic and political justice and reflected them in his two plays, *Paleru* ('Annual Servant') and *Cooli Raju* ('The Labourer King').

Paleru depicts the village life of coastal Andhra, which was characterised by socio-economic stratification in which the agricultural labourers were drawn basically from the dalit communities, while the landlords belonged to the upper castes. The dalits were economically and educationally the most backward. Government efforts and

Gandhian programmes played no significant role in their upliftment. Social evils like untouchability and caste discrimination were practised unabated. Moreover, the caste ideology denied them any access to knowledge and education. The hero of the play, Venkanna, a dalit 'paleru', works for the same landlord who employed his forefathers. He was a victim of hereditary bonded labour which was practised by the upper caste landlords with the sanction of the caste system and in the name of custom and tradition. In spite of rigid customary sanctions the hero, with the help of an upper caste school teacher, was encouraged to go to school and study. The little paleru, on seeing the upper caste children of his age going to school, was also inclined to study. But his landlord would not tolerate such an idea. He did not even like the paleru singing songs in the fields. However, with the help

of the school teacher and an upper caste girl, the paleru decided to escape from the village and go to Rajamundry (a nearby town) and join the school run by the Brahma Samaj. One day when the landlord came to know about the intentions of the paleru, he scolds his father. The dialogue is instructive of the attitude of the upper castes toward the efforts of the dalit masses to educate themselves and acquire knowledge

Kuberaiah (landlord): O, son of a he buffalo! Did anybody go to school in your family? Pullatah (Dalit): Yes sir, Ah Ah is it? No sir no.

K: Is not it a sin for you to read (and write)?

P: Big sin lord Very big sin indeed Neither during the time of my grandfather, nor my father, myself, nor even my son Yenkadu ..

K: Stop It is alright until your time With your son Yenkadu the tradition of your family is destroyed

P: No my lord I swear, I pledge my life My son is not like that

K: You son of a donkey Why does a son of a slave need education?

P: To whom my lord? Even if you cut my stomach, there is not word in it

K: Osh! Your Yenkadu.

P: Oh my goodness

K: He will be of no use

P: O my God! (beats chest).

K: He is not doing any work He always sings and reads books Stop him from doing agricultural labour. Educate and make him a collector Get lost

P: We are your slaves my lord Save us my lord I will kick that son of a donkey. I will bury him What stops you my lord? You should have broken his bones

K: Well, I did something. If you can teach him good manners and behaviour keep him here or else look for some other way. As you are dependent on me since your childhood I am just thinking OK you can go

The father goes home and beats his son. Later the boy runs away from the village, pursues his studies and secures BA degree. After that he becomes a deputy collector. He also marries the upper caste girl, his childhood friend.

The central theme of this play is an urge for social equality and the acquisition of knowledge and education by the dalit masses for a decent living as well as for a respectable place in the society. In it there is a suggestion that through education and inter-caste marriage social mobility is possible. The author opined that the problems of dalits is not only that of class. In Indian society the dalits unlike other castes have no opportunity to lead a respectable life. Hence dalits should be educated first and obtain good official positions. This play also represents the educational and professional needs of dalits, for education was seen to be a social leveller and a means to acquire secular and political power. The play is imaginary no doubt, but it is a guide to many real life experiences of the dalit masses. It was staged in many villages of coastal Andhra. As a literary

creation it became a basis for social change/mobility. The author remarked that many young dalits, inspired by the play, left their traditional occupation and took to education. The popularity of this play is indicated by the fact that in 1953, Bheemanna (the author) was facilitated in Ponnur village, Guntur district, on the occasion of its hundredth performance

In this paper we have presented an analysis of the beginnings of a literary genre which can be broadly called dalit literature.²⁶ Although most of the scholars whose writings are examined in this article did not exclusively write about and/or for the dalit masses, yet being products of dalit communities they represented the problems of the dalit masses and their emerging consciousness in their works more sympathetically and realistically than the non-dalit scholars who preceded them. There seems to be a fundamental difference between the savarna scholars who projected the dalit problem in their writings and the dalit scholars. The non-dalit (upper caste) scholars were distanced and stood aloof from the dalit masses. They were also unfamiliar with their emotions, aspirations and living conditions. If at all there was any solidarity, affinity and link between them it was purely emotional. Such an emotion was guided by an ideology of nationalism and marxism, about which the large majority of the dalit masses were ignorant. In contrast, the dalit intelligentsia had good knowledge of and insight into the life experiences of the masses about whose problems they wrote, their thoughts and feelings were fused with those of the masses. The subject matter for their works was provided by the everyday life experiences and existential problems of the dalit masses. These writers, who found inexhaustible raw material in the society and community in which they and the masses were born, shaped it into a realistic literary representation. The main characteristic feature of dalit literature was its contemporaneity and realistic presentation. The savarna scholars who depicted the dalit problems in their writings were guided neither by the philosophical and ideological tradition of the bhakti saint-poets nor by the liberation ideology and philosophy of Phule and Ambedkar. The dalit scholars critiqued the brahmanical social order and Hindu ideology based on the philosophy and ideology of both the bhakti saint-poets as well as Phule and Ambedkar. In this sense it can be said that the dalit intellectuals of the pre-independence period were the forerunners to the contemporary dalit literary and cultural movements in the state.

Redefining Irrigation Potential

Don't Damn the CV Alone

S M Vidwans

MY critique (EPW, December 4, 1993) of the paper 'Redefining Gujarat's Irrigation Potential' (EPW, June 26, 1993) by D H Parikh, A J Vora and Y K Alagh (PVA for short) showed that PVA's paper failed in its objective of establishing variability of rainfall as the reason for redefining (i.e., down-rating) Gujarat's irrigation potential. But, as the critique pointed out, rainfall variation obviously affects irrigation potential in terms of the volume of water stored in the reservoir – the very reason why the dependability factor comes into play. If dependability is 75 per cent, in that much per cent of years over a long period full potential will be realised and in 25 per cent less than full. One can therefore think about an *average potential* that will be obtained over a long period, an average of (1) full potential in 75 per cent of years, and (2) less than full potential – less by varying amounts – in the remaining 25 per cent. The difference between the full and the average potential gives the extent of down-rating of the former that will be required because of rainfall variation. Thus, the maximum, though unlikely, extent of down-rating will be 25 per cent when dependability is 75 per cent, and 50 per cent when the latter is 50 per cent. It is therefore a truism that full irrigation potential requires to be down-rated on account of rainfall variation; it is surely not a discovery. The only point of interest perhaps is the *extent of down-rating* and its relationship with rainfall characteristics. Possibly a minor point, it becomes statistically interesting to pursue because PVA raised it and handled it rather unsuccessfully. That is the limited objective of this follow-up paper.

IRRIGATION POTENTIAL

There may be several project-specific reasons for a less-than-full realisation of its irrigation potential. Some of them arise after water is released from the reservoir; they apply even if the reservoir were full. Other reasons such as rainfall variation and environmental degradation of the catchment area affect the very volume of water in the reservoir. We are not concerned with the first type of reasons, and of the second, only with rainfall variation assuming that the rest were taken into account when the project was designed and remained unchanged after its construction. This assumption is neces-

sary to measure the effect of rainfall variation unconfounded with other changes that may have occurred. Thus, the scope of the study is confined to measuring the effect of rainfall variation on the volume of water in the reservoir, and the latter is taken to mean the same as irrigation potential, with the two terms used synonymously in the paper.

Using a fairly long series of rainfall data for low-rainfall centres of Maharashtra, the paper studies the relationship between water-storage and rainfall parameters and offers an empirical basis for the main assertions of my critique. It also gives estimates of the main measure for PVA's sample centres and a few other centres from Gujarat-Saurashtra based on an empirically tested model of rainfall distribution. Finally, it quantifies certain implications of the suggestion to reduce dependability. The results would show that neither rainfall variation nor its effect on water storage is of such a magnitude as to cause a disturbing pre-occupation with the need to redefine (down-rate) irrigation potential in Maharashtra because of either of them. It is not suggested that the same conclusion would apply to Saurashtra or Gujarat. Thinking that they succeeded in their objective, PVA appeared to generalise their Saurashtra findings for the whole of Gujarat. The results given here will argue against such generalisations.

Let

- v = The volume of water that gets stored in the reservoir at the end of a year;
- V = volume of water when the reservoir is full, that is the full irrigation potential;
- y = total rainfall in a year in the catchment area;
- M = mean of y ;
- S = standard deviation of y ;
- C = S/M , the coefficient of variation (CV) of y ;
- d = the dependability factor, that is the probability that in any year the reservoir will be full, i.e., of $v = V$;
- $P(1/2)$ = the probability that in any year the reservoir will be less than half-full, i.e., of $v < V/2$, the main variable of PVA's paper.

The values of proper fractions: d and $P(1/2)$, and of C may be expressed as

percentages. Other notation will be introduced as the need for it arises.

ANNUAL YIELD AND RUN-OFF: ENGINEERS' FORMULAE

Since an inch of rainfall on one square mile of an area equals 2.3232 Mcft of water, with y inches of it in a year on a catchment area of A sq miles the total volume of water that falls on it, i.e., the annual yield: Q , is given by

$$Q = 2.3232Ay \text{ Mcft} \quad \dots(1)$$

However, not all of this flows down the catchment because of losses in absorption, evaporation and transpiration which depend upon several physical and topographical characteristics of the catchment and the amount of rainfall itself. Irrigation engineers' different formulae use only a certain percentage of y to work out Q ; the reduced y is called run-off: R . The basic logical structure of almost all the formulae is, however, seen to be the same, that is, the percentage of y that will be effective as run-off will be $(y-H)$, and the run-off given by

$$R = y(y-H)/100 \text{ inches} \quad \dots(2)$$

where H , the technical parameter, and 100 are both in inches.

The annual yield is then given by

$$Q = 2.3232AR = BG(y) \text{ Mcft} \quad \dots(3)$$

where $B = 0.023232A$, and $G(y)$ stands for the quadratic expression: $y(y-H)$, in y .

The technical parameter: H , varies in different formulae ranging from 3" to 7", its lower value reflecting better run-off conditions in the catchment. It is assumed that the annual rainfall is at least H inches and does not exceed $(100+H)$ inches, the latter holding good for the low rainfall areas to which the formulae apply. As an example, with $y = 20"$ and $H = 7"$, though the amount of rain water per sq mile of catchment is 46.464 Mcft, only $(20-7) = 13$ per cent of it will run off and the annual yield will be 6.04032 Mcft. In one type of formula, the value B differs from the one given above, but as we shall see, this does not affect our results.

We should note in passing that the formulae use total rainfall and do not take into account its distribution over time. Also, one of them uses total monsoon rainfall while the others the total annual rainfall.

Given the value of H , the percentage of rainfall which is effective as run-off, i.e. $(y-H)$, thus depends on the amount of rainfall itself, and this essential structure of the formula (3), and the value of H have certain important implications for our problem. The run-off or annual yield not only increases with the amount of rainfall, but increases in proportion to much more than the square of the rainfall amount, and

more so when the initial amount is small or H large. If the amount doubles, the run-off more than quadruples; conversely, to get half of the run-off (for a particular rainfall amount), rainfall has to be more than 0.7071 time the initial amount, that fraction being the square root of $1/2$. (See mathematical note: 1.)

VARIATION IN RAINFALL AND WATER STORAGE

Let Y_d be the rainfall in inches such that $\text{Prob}(y \geq Y_d) = d$... (4)

Then, if dependability of the full potential, V , is to be d

$$V = BG(Y_d) \quad \dots (5)$$

For 75 per cent dependability, Y_d is the first quartile, and for 50 per cent Y_d is the median of the rainfall distribution. When rainfall exceeds Y_d , v does not exceed V as the excess water will overflow. This ensures that

$$\text{Prob}(v=V) = \text{Prob}(y \geq Y_d) = d \quad \dots (6)$$

and

$$\text{Prob}(v < V) = \text{Prob}(y < Y_d) = (1-d) \quad \dots (7)$$

If we consider now only those years when the reservoir does not fill to its full capacity, i.e. $v < V$, or $y < Y_d$, the average value of v for such years, $\bar{v}_1$ will be given by

$$\bar{v}_1 = BE_1\{G(y)\} \quad \dots (8)$$

where E_1 , in standard notation, stands for the conditional expected (average) value operator, the condition here being: $y < Y_d$ or $v < V$. Obviously, $\bar{v}_1$ will be less than V . From this, the unconditional average of v , that is, its average over all years $\bar{v}$, will be

$$\bar{v} = Vd + \bar{v}_1(1-d) \quad \dots (9)$$

Clearly, $\bar{v}$ will also be less than V and the relative extent to which it is so gives the down-rating factor, DR, by which V should be reduced to obtain $\bar{v}$. Thus,

$$DR = (V - \bar{v})/V \quad \dots (10)$$

and using (9),

$$DR = (1-d)(1-\bar{v}_1/V) \quad \dots (11)$$

DR is a proper fraction and may be expressed as a percentage. Further, (11) shows that its maximum value is $(1-d)$, as stated in the first paragraph. *Ceteris paribus*, DR increases with H . It would also tend to do so when Y_d decreases (see mathematical notes: 2 and 3). Also, it measures the relative average variation of v from V .

We have thus derived an expression for the extent of down-rating of full potential on account of rainfall variation. For its calculation, all that is needed are a long series of annual rainfall data and values of the dependability factor and H . We may also note for this purpose that for any year with rainfall $y < Y_d$, by (3) and (5),

$$v/V = G(y)/G(Y_d) = y(y-H)/\{Y_d(Y_d-H)\} \quad \dots (12)$$

and consequently, by (8),

$$\bar{v}_1/V = E_1\{G(y)/G(Y_d)\} = \{E_1(y^2) - HE_1(y)\}/\{Y_d^2 - HY_d\} \quad \dots (13)$$

In (12) and (13), y , Y_d and H , all can be expressed in inches or metric measures. The procedure of calculation is straightforward: From the annual rainfall data, work out the value of Y_d and, from it and H , the value of $G(Y_d)$. Taking all values of y which are less than Y_d , calculate their average: $E_1(y)$, and the average of their squares: $E_1(y^2)$, then $\bar{v}_1/V$ by (13), and DR by (11). Alternatively, one may calculate v/V by (12) for all such values and take their average to obtain $\bar{v}_1/V$ and then DR by (11).

One can also derive an expression for $P(1/2)$ in which PVA are interested. If Y_d is the rainfall needed to fill the reservoir to half its full capacity, then using (3) and (5), we get

$$2Y_d(Y_d - H) = Y_d(Y_d - H) \quad \dots (14)$$

With Y_d known, H can be calculated as the solution of this quadratic equation, and from it $P(1/2)$ by the equation

$$P(1/2) = \text{Prob}(y < Y_d) \quad \dots (15)$$

with the RHS worked out from the rainfall data as the proportion of years in which rainfall was less than Y_d . Like DR, $P(1/2)$ increases as H increases and tends to do so when Y_d decreases. (See mathematical note: 6). It should be clear that DR and $P(1/2)$ are different measures although PVA used the latter to infer about the former.

MAHARASHTRA

We shall now apply these formulae to work out the values of DR and $P(1/2)$ for a sample of low-rainfall centres in Maharashtra on the basis of their rainfall data. Before that, it would be instructive to note a few important characteristics of the rainfall distribution in the state

The values of the mean: M , the coefficient of variation: C , and the minimum rainfall were available for 334 centres in Maharashtra based on data on annual rainfall for varying

TABLE 1 DISTRIBUTION OF CENTRES BY AVERAGE ANNUAL RAINFALL AND CV
Maharashtra

3000 and more	-	1	-	4	9	-	14	49.41

Note: Fractional part of value of average rainfall (mm) and of percentage (minimum/average) ignored in classifying centres.

number of years of the period: 1900-80. Only those centres with data for 50 or more years were considered assuming that their estimates of M and C would be relatively firm. Omission of centres with questionable values of the minimum further reduced the number to 180 whose data have been used in making Tables 1 and 2. Centres with low annual rainfall: 400 to 800 mm, numbered 87, with 76 having data for 70 or more years.

Table 1 classifies the 180 centres by ranges of M and C and also gives the average values of C for ranges of M. The expected inverse relationship between the two emerges from the table.¹ For the low rainfall centres the average value of C is a little over 30 per cent with most values between 25 and 35 per cent. As we shall see later, Saurashtra centres have generally a much higher coefficient of variation than this.

Another parameter of rainfall distribution which might be relevant is the threshold value below which rainfall rarely measures. The observed minimum in a long series provides a good approximation to it. Table 2 classifies the centres by ranges of M and the percentage ratio of the minimum to the average. One would expect the ratio to tend to increase with M. The table shows this tendency, but not very strongly. It is rather weak for low values of M with the ratio lying between 20 and 50 per cent and averaging to around 35 per cent.

For studying the relationship of DR with rainfall parameters, a purposive sample of 24 low-rainfall centres was selected to represent the range of values of M, C, and the relative minimum: R_m . The selection was made in pairs of centres within each M-group spread over the range of the C-values in that group; each centre in a pair had roughly the same C but as widely different value of R_m as the data permitted. The names of the sample centres, and the values of the mean, CV and the minimum are given in Table 3 which also gives the values of the first quartile and the median. (The values of R_m are given in Table 5.) Annual rainfall figures for each centre were then used to work out the values of DR and $P(1/2)$ by the application of the first procedure based on formula (13). The calculations were made for two dependability factors: 75 and 50 per cent, and two values of H: 3" and 7", or 76.2 mm and 177.8 mm. The results are given in Table 5.

The alternative procedure of calculation of DR is illustrated in Table 4 to help in understanding the relationship between rainfall and v/V . The table also illustrates the calculation of $P(1/2)$.

The table is self-explanatory. Nevasa has 80 years' rainfall data. After arranging the 80 values of annual rainfall in an ascending order, the first quartile, for 75 per cent dependability, works out at 453.0 mm. The

table shows the first 20 lowest values of annual rainfall arranged in an ascending order. Using equation (12), the next two columns give, for each rainfall value, the percentage ratio: v/V , for the two values of H. Note that although the first rainfall value is nearly half the first quartile value, the ratio: v/V , is less than one-fourth for the lower value of H, and very much less for the higher value of H.⁴

Consider $H = 76.2$ mm; the average of the 20 values of v/V is 63.13 which gives, by equation (13), the percentage value of $\bar{v}/V$. From this and by equation (9), $\bar{v}/V$ is 90.78 per cent, and by equation (11), DR works out at 9.22 per cent. With higher H, DR is 10.74 per cent.

To work out $P(1/2)$, we first solve the quadratic equation (14) with Y_0 equal to 453.0 and obtain Y_1 equal to 332.71 mm and 353.92 mm for the two values of H respectively. The proportion of years when the rainfall was less than these two values gives the corresponding two values of $P(1/2)$. The proportion is obtained by interpolation using the first two columns of the table, after applying continuity correction, as 8.86 and 10.99 per cent respectively.⁵ Note that as H increases so do DR and $P(1/2)$.

Table 5 shows the values of DR and $P(1/2)$, for two values of H and two values of the dependability factor, for every sample centre. It also gives the values of the three rainfall parameters: M, C, and R_m to help study the relationship of DR and $P(1/2)$ with them. The serial numbers of the centres are the same as those in Table 3. The commonly used two engineers' formulae take $H = 7"$

TABLE 4: ILLUSTRATIVE CALCULATION OF DOWN-RATING FACTOR: DR, AND OF $P(1/2)$, THE PROBABILITY OF RESERVOIR FILLING TO LESS THAN HALF THE FULL CAPACITY, FOR NEVASA WITH 80 YEARS' DATA Dependability: 75 Per Cent

or thereabouts; the third takes it to be 3". Results are shown for both to help study the relationship of DR and P(½) with H. (Table shows H in metric measure.)

When dependability (d) is 75 per cent, DR does not exceed 10 per cent in most cases for H = 76.2 mm and 12 per cent for H = 177.8 mm. The design of the table helps one see how DR varies according to the three rainfall parameters and H. As a direct consequence of the structure of the run-off function: G(y), lower mean rainfall, higher CV, and lower relative minimum, all separately push up the DR. Also for every centre, DR is higher for the higher value of H, though the difference is quite small. (As we shall see later, the difference could be large in other cases.) Thus, although rainfall variation leads to the consideration of DR, its value – that is, the extent of down-rating – is determined by other rainfall parameters also and the rainfall-runoff relationship in the catchment.

With DR small enough and varying in a narrow range of 7 to 14 per cent, there is little point in quantifying its relationship with the rainfall parameters. However, to broadly gauge the relative importance of the latter, a regression analysis was carried out which yielded the following results. DR refers to d = 75 per cent and H = 177.8 mm. The mean: M, is measured in decimeters.⁶

$$DR = 13.86 - 0.94M + 0.16C - 0.07R \\ (4.72) \quad (-4.84) \quad (2.94) \quad (-3.57) \quad \dots(16)$$

$$R^2 = 0.8373 \quad F_{1,20} = 34.32 \\ \text{and}$$

$$\log_e DR = 2.56 - 0.56 \log_e M + 0.46 \log_e C \\ t_{20}: \quad (3.40) \quad (-5.48) \quad (3.06) \\ - 0.23 \log_e R_m \quad \dots(17) \\ (-4.11) \\ R^2 = 0.8641, \quad F_{1,20} = 42.40$$

All t-values are highly significant, even at 0.5 per cent level of significance, and so are the F-values. The analysis of variance shown in Table 6 points out that every one of the three parameters makes a significant contribution in explaining the variation in DR. Equation (17) shows that the mean rainfall is a little more important than the CV in determining DR and the relative minimum also influences it substantially. Not merely a high CV but a low mean also increases DR (see mathematical notes 4 and 5).

As one would expect, reduction of dependability, from 75 to 50 per cent, invites larger DR which, as the table shows, then lies between 16 to 25 per cent (H = 177.8 mm), nearly 2.5 times its value for 75 per cent dependability. Its relationships with H and the rainfall parameters continue to be the same.

For all sample centres P(½) is also small for 75 per cent dependability. It exhibits the same relationship as DR with H and the rainfall parameters for both values of the dependability factor. Curiously enough, it differs from DR by a small margin of one or two percentage points, although it is slightly less than DR on the average and has greater relative variation than that in DR. The two are positively related with correlation coefficient ranging from 0.87 to 0.96;

the larger the P (½) the larger the DR, vice versa, an observation made in my critique.

In sum, the down-rating of full irrigation potential in Maharashtra, for projects with low-rainfall catchment areas, that may be required due to rainfall variation will be between 8 and 12 per cent for 75 per cent dependability and between 20 and 25 per cent for 50 per cent dependability. Major and medium irrigation projects are generally designed with 75 per cent dependability, and they account for a large percentage of total irrigation potential. Even if their catchment areas have low rainfall – which may not be the case always – down-rating of full irrigation potential on account of rainfall variation does not appear to be a serious problem and should be the least of the worries of policy advisers. It is also observed that the extent of down-rating depends not only on the CV but also on the mean rainfall, and the two affect it in opposite directions.

GUJARAT

The above approach could not be followed for Gujarat centres since a long series of annual rainfall data for them are not available to me. Only the values of the mean and the standard deviation are available for PVA's centres and for some additional centres. Using these values, I attempt to give reasonably good approximations to DR-values for these centres based on a tested statistical model of frequency distribution of annual rainfall. Scientists of the Institute

of Tropical Meteorology (ITM), Pune have done considerable work to discover the model, found that the two-parameter Gamma distribution fits the Indian data well, and concluded that "the seasonal and annual rainfall at stations in different parts of India can be taken to be Gamma distributed".⁷ The two parameters of this distribution can be estimated from the known values of the mean and standard deviation or CV, and the distribution completely specified.⁸ All the calculations that would have been done on the observed distribution can be done by appropriate calculus on the specified Gamma distribution."

For our problem too the Gamma distribution seems to work well. The values of DR were calculated on its basis for the 24 centres of Maharashtra, and when compared with those in Table 5 were observed to differ from them by a small margin, not exceeding two percentage points, for most centres and were on the average lower by a half percentage point. For our problem this degree of approximation is very satisfactory. Table 7 shows the comparison for $H = 177.8$ mm only for the sake of brevity and also because that value is perhaps more appropriate for low rainfall centres of Maharashtra and Gujarat.

Based on the Gamma distribution, Table 8 shows values of DR for PVA's centres and some additional centres.¹⁰ PVA's centres are grouped first according to the mean rainfall, and then within each group arranged in an increasing order of CV; the additional centres are arranged in an increasing order of the mean. As stated in my critique, PVA did not give the value of dependability factor for each project; the table shows DR for both

the values. PVA's estimates of mean and CV are based on an inadequate sample; the additional centres have data for a much longer series of years and perhaps represent the Saurashtra situation better. It appears that values of CV exceeding 60 per cent for PVA's centres are suspect, especially for Moj.¹¹ Such cases excluded, DR lies for PVA's centres between 12 and 16 per cent for 75 per cent dependability, and between 25 and 30 per cent for 50 per cent dependability.

Values of $P(1/2)$, not shown in the table, differ little from corresponding DR values as in Maharashtra's case. Because PVA's $P(1/2)$ values, based on the observations on reservoir filling, also reflect the effects of factors other than rainfall variation, they are not strictly comparable with DR and $P(1/2)$ values based on rainfall distribution. Also, the number of observations is small. On the whole, they are much higher than the DR values shown in the table for 75 per cent dependability. Even for 50 per cent dependability, they are too high for centres with low enough CV and not so low mean.

Four of the additional five centres are from Saurashtra: for two of them, with low means and high CVs, the DR is outside the above range and higher. A comparison of Veraval and Bhuj, which have about the same CV, brings out the considerable effect the low mean has in pushing up the DR. (Sapda-Vartu comparison shows the same but to a less extent.) It appears that in Gujarat and Saurashtra, except when the mean rainfall is less than 400 mm, the extent of down-rating in most cases will not exceed 15 per cent for 75 per cent dependability,

and 30 per cent when dependability is 50 per cent.

SEPARATION OF EFFECTS OF MEAN AND CV ON DR

The Maharashtra exercise attempted to quantify the separate effects of mean and CV on DR. But such a separation by an analysis of cross-sectional data has limitations because of the relationship between the two—both arithmetical and observed: The larger the mean, the smaller the CV. The use of a model distribution however enables us to separate the effects.¹² Table 9, prepared for this purpose, shows values of DR based on the Gamma distribution for all combinations of five values each of the mean and CV, and two values each of H and the dependability factor. The lowest two values of CV roughly cover its range in Maharashtra, and the other three in Saurashtra and Gujarat. The highest mean value may not be perhaps applicable to Saurashtra. In a sense, the table is a ready reckoner for DR. The set of four equations given at its foot approximates the DR values in it. The coefficients of $\log M$ and $\log C$ in them give the average elasticity coefficients of DR with respect to M and CV .¹³

The first point to note is that if all other parameters remain the same, DR increases with CV, as expected, and much more so when the mean is low and H higher. Second, the mean makes a large difference to DR when it is low; an increase in a low mean reduces DR to a considerable extent, and this effect is more pronounced with higher CV and H . Third, the parameter, H , has a significant effect on DR when the mean is

TABLE 6. REGRESSION OF DR ON C, M AND R_m

24	Kalvan	10.36	11.12	21.57	24.38

low; the higher H leads to a larger DR with a low mean, and more so when CV is also high. The equations show that the positive elasticity coefficient of C is large but less than unity, and decreases with dependability. The coefficient of M is negative and sizeable for higher H, and quite large for 75 per cent dependability. It thus counters the effect of CV on DR. Evidently, there is also some "interaction" effect of the three parameters on DR.

It should be thus clear that if DR is to be investigated, all relevant parameters should be taken into account and not merely the CV. As I pointed out in my critique, we are dealing with a case of physical relationship of the variables with these parameters, and, to be useful, a statistical analysis has to incorporate the relationship. If, disregarding it, as PVA did, observations for projects with differing mean values of catchment rainfall, different dependability factors, and, perhaps, different types of catchment are all put together, and subjected to a regression analysis between the DR and the CV, such an exercise will be misleading even if, unlike PVA's it is based on sound data.

REDUCTION IN DEPENDABILITY

PVA make a reference to a suggestion made in 1987 by one of them to lower dependability from 75 to 50 per cent in regions "with high value of water", and to Gujarat government's corresponding action in drought-prone areas that followed. The suggestion is not a new one: the Maharashtra Irrigation Commission (1960) made the same recommendation observing further that: "It is true that with a lower dependability the average annual utilisation over a period of years would be less in comparison to the projected utilisation and that this would increase the cost, but this increase would be counterbalanced by economies inherent in large scale construction and operation of irrigation schemes. In any case, the need for more water makes the harnessing of larger supplies imperative." The Commission also assessed that about 33 per cent additional water would become available in the process.¹⁴

Our analysis of rainfall data or model-based distribution can be extended to quantify the implications of this suggestion. Suppose V, $\bar{V}$, and DR refer to 75 per cent dependability, and V', $\bar{V}'$ and DR' to 50 per cent dependability, when the project is redesigned with the same dam-site so that the catchment area is not altered. Note that each of the latter three is greater than its corresponding previous value. The factor by which V will increase, i.e. the escalation factor

$$EFV = V'/V = G(Y_{0.75})/G(Y_{0.50}) \quad \dots(18)$$

The capacity of the reservoir will have to be increased and other infrastructure augmented to serve the increased full potential. The escalation factor: EFV, will thus indicate, but not measure, the implied cost escalation. The benefits, in terms of the increase in the average potential, would not however increase in the same proportion. The escalation factor for the average potential

$$EF\bar{V} = \bar{V}'/\bar{V} \\ = EFV(1 - DR)/(1 - DR') \quad \dots(19)$$

using (10) and (18). Since DR' is larger than DR, EF $\bar{V}$ is less than EFV. Thus the increase in the average potential will be proportionately less than that in the full potential as the Maharashtra Irrigation Commission noted. For example, for Nevasa, using Tables 3 and 5, and with H = 177.8 mm, EFV is 1.9276 and EF $\bar{V}$ 1.6736..

The percentage difference between the two escalation factors, with EFV as 100, has much significance. Suppose K and K' are the costs per Meft of V and V' respectively. The costs per Meft of the average potential in the two cases will be KV/ $\bar{V}$ and K'V'/ $\bar{V}'$, and if the latter is not to exceed the former

$$K'/K \leq V\bar{V}'/V'\bar{V}$$

that is

$$K'/K \leq EF\bar{V}/EFV$$

$$\text{or the percentage reduction from K to K', i.e.} \\ 100(K - K')/K \geq 100(EFV - EF\bar{V})/EFV \quad \dots(20)$$

(For the above example of Nevasa, the right hand side equals 13.18.) While K and K' are taken into account when the project is designed, it is the unit cost of average potential that is the effective cost. If this cost is not to increase in the process of reducing dependability, the reduction in unit cost of full potential (K to K') should be at least equal to the percentage difference between EFV and EF $\bar{V}$ with EFV as 100.¹⁵ (In Nevasa example, the reduction in unit cost has to be at least 13 per cent.) Based on the Gamma distribution, Table 10 gives the values of the two escalation factors and their percentage difference (for the same set of values of M, CV and H as of Table 9).

The proportional increase in the average potential is always less than that in the full potential. Both display the same trend as DR for variation in H, the mean and the CV. But changes in the mean affect them much less except when it is low and CV and H higher. Their very large values in certain cases reflect the very low volume, per unit of catchment area, of the 75 per cent dependability full potential. In these situations, unless the catchment area is very large it may be impractical to create this potential.

v	Ahmedabad (92)	779.00	39.02	10.99	24.25

Note: Figures in parentheses after the names of additional centres are numbers of years of data on which the mean and the CV are based

The percentage difference between the two escalation factors varies in a very narrow range: 10 to 20. It varies only a little with the mean unless the latter is very low, or with H; the CV affects it the most. The conclusion would be that with lowering of dependability from 75 to 50 per cent, the cost per Mcft of new full potential has to be less than before by at least 10 to 20 per cent depending upon the CV. Otherwise the lowering of dependability will become a more expensive proposition in terms of the unit cost of average potential.

Results in Table 10 will perhaps support PVA's argument for lowering of dependability of Saurashtra projects.

CONCLUDING REMARKS

Variations in annual rainfall, a natural phenomenon, causes variation in annual potential of an irrigation project; more of it if dependability of full potential of the project is relatively low. If policy advisers are seriously concerned with this unredressable variation in potential, they should note – as this exercise has made it abundantly clear – that not only the CV but the mean also of annual rainfall determines the extent to which the down-rating of the full potential would be required on this account. The principal argument of PVA's paper that DR increases with CV is unexceptionable. But it is only partially true; it is true if the mean remains the same. And the effects of changes in the mean and the CV on DR are in opposite directions; just as a larger CV causes a larger DR, so also a smaller mean. Nature is not always kind and the two often go together. It would be incorrect to hold the CV as the sole offender.

Ideally, one should estimate DR and study its relationship with rainfall parameters on the basis of data on annual discharge of a river and the annual rainfall in its catchment. In the absence of the former data, we have carried out the exercise using only the latter and the rainfall-runoff equations of irrigation engineers. The centre piece of the exercise is the structure of these equations. But it will be unrealistic to suppose that G(y) precisely defines this structure or that a particular value of H specifies it for a particular project.¹⁶ After all, G(y) is only an approximation – perhaps a good one – of reality. The values of DR and other measures given here are therefore, only as good as the engineers' formulae. These have been in use for many decades now and could be refined, and in consistence with their refined versions the DR values could be also reworked. The thrust of the present exercise is, however, only to demonstrate how, once the formula defining rainfall-runoff relationship is given, DR and other measures can be worked out using a long series of annual rainfall data. Further, DR is a direct

TABLE 9: VALUES OF DR (PER CENT) BASED ON GAMMA DISTRIBUTION FOR DIFFERENT VALUES OF MEAN, CV, H, AND THE DEPENDABILITY FACTOR: d

d (Per Cent)	H mm	Mean mm	CV (Per Cent)

Note: Per cent difference, absolute, with EFV as 100. All figures rounded after calculations.

result of the physical relationship between the run-off and the rainfall and a meaningful exercise investigating DR and its relationship with rainfall and other parameters cannot ignore this physical reality.

A large amount of data should now be available for completed projects on annual and seasonal rainfall in the catchment, run-off and discharge, and the volume of water in the reservoir every year, classified by different types of catchment. The refinement of the old – almost ancient – formulae on the basis of these data would be worth the attention of irrigation engineers.

Finally, this exercise ends on a congratulatory note. It is observed (Table 5) that the values of DR and $P(1/2)$ are generally close to each other though the latter show a greater variation and are on the average slightly lower than the former. Their values based on the Gamma distribution also exhibit the same closeness. Some mathematical relationship must be at work, and unaware of it, I did not expect this closeness before I started this exercise. PVA do not refer to the mathematical relationship nor do they explain why $P(1/2)$ would be a good proxy for DR, to measure which was their objective. It cannot be that $P(1/2)$ was easily observable, for DR was equally so from the same data on the filling of the reservoir on which $P(1/2)$ was based. PVA thus deserve compliments for their serendipity in choosing $P(1/2)$ to stand in for DR so satisfactorily.

Mathematical Notes

The implications of the structure of $G(y)$ follow from a high school algebra theorem: A ratio of lesser inequality (i.e., less than one) between two positive numbers decreases when a positive number less than both is subtracted from the numerator and the denominator. As a corollary, the ratio increases when a positive number is added to both. Conversely, with the same arithmetical operations, a ratio of greater inequality changes in the opposite direction. Thus, if $0 < H < H' < y < Y$

$$(y - H')/(Y - H') < (y - H)/(Y - H) < y/Y < 1 \quad \dots(i)$$

(1) From this it follows that with $G(y) = y(y - H)$

$$G(y)/G(Y) < y^2/Y^2 \text{ or } G(Y)/G(y) > Y^2/y^2 \quad \dots(ii)$$

Thus, if y increases to Y , $G(y)$ increases by a factor larger than the ratio of their squares. Further, the ratio of the two ratios:

$$[G(Y)/G(y)]/[Y^2/y^2] = (1 - H/Y)/(1 - H/y) \quad \dots(iii)$$

which is always greater than one, reduces to one as a limit when both y and Y tend to infinity, and tends to infinity when both decrease so that y tends to H . The ratio: $G(Y)/G(y)$, thus becomes a larger multiple of (Y^2/y^2) as y becomes smaller. A little

derivation will show that the ratio behaves similarly when H increases to y .

(2) If $G(y)' = y(y - H')$, then by inequality (i), $G(y)'/G(Y)' < G(y)/G(Y) \quad \dots(iv)$

Therefore, when H is changed to a larger value: H' , all values of v/V for a given set of y -values less than a given Y_d decrease, and as a result $\bar{v}/V$ decreases, and by (11) of the paper, DR increases. Thus, DR is an increasing function of H .

(3) We consider only those cases when $d \geq 0.5$. Because of the positive skewness expected in the rainfall distribution, Y_d will then be less than the mean. For a given d , a change in Y_d is caused by changes in y -values. Generally, Y_d will increase or decrease because all lowest $(1 - d)$ proportion of y -values do so. Three simple models of change are considered below in which all original ordinal relationships remain unchanged. The changed values are denoted by y' and it is assumed that their minimum value continues to be greater than H .

If, (A): all y -values change by the same amount, or (B): they change in the same proportion, Y_d will also change similarly, and in both cases it will be easy to show by the application of the theorem or its corollary that DR will be a decreasing function of Y_d .

(C) In the third case, all y -values less than the mean, M , increase (decrease) and those above the mean decrease (increase) by varying amounts but their ordinal relations are not changed. The new values are given by $y' = ky + (1 - k)M$ and $Y_d' = kY_d + (1 - k)M \quad \dots(v)$

where k is positive. If $k < 1$, Y_d and all y -values less than it increase. Further, since

$y' - H = k(y - H) + (1 - k)(M - H)$, using the corollary to the theorem, it will be seen that for all $y < Y_d$, $y'/Y_d' > y/Y_d$ and $(y' - H)/(Y_d' - H) > (y - H)/(Y_d - H) \quad \dots(vi)$ and consequently,

$G(y')/G(Y_d') > G(y)/G(Y_d) \quad \dots(vii)$ which leads to a decrease in DR. If $k > 1$, Y_d and all values less than it decrease, all relationships are reversed and DR increases. In the case (C) too, DR is a decreasing function of Y_d .

From these simple models, it will be clear that DR would generally – but not always – decrease (increase) when Y_d increases (decreases). When more complex changes take place in the lowest $(1 - d)$ proportion of y -values that change Y_d , one needs the knowledge of the specific distribution of y to work out the effect of the change in Y_d on DR.

(4) When $d \geq 0.5$, for a given mean, Y_d is a decreasing function of CV, and for a given CV, an increasing function of the mean. The three cases considered above represent the situations when, (A) the mean and CV change in opposite directions, (B) only the mean changes but not the CV, and (C) only the CV changes but not the mean.

In the fourth case: (D), when the mean and the CV change in the same direction, opposing changes affect Y_d and the net change in it and its effect on DR can be worked out only if the distribution of y is fully specified. While it may be intuitively clear that DR, for a given mean, will be an increasing function of CV, that it will be related to the mean may itself be an unexpected result. The above derivations will show how, through the changes in Y_d and values below it, DR tends to become a decreasing function of the mean for a given CV.

(5) It is relatively easy to see how the value of the minimum affects DR. If, for a given d and Y_d , the minimum increases (or decreases), it would generally push values lower than Y_d towards it (or pull them away from it) which will result in a higher (lower) value of $\bar{v}/V$ and consequently a lower (higher) DR. Even by itself, the minimum, when it changes, will affect DR similarly to some extent.

(6) In the case of $P(1/2)$, from equation (14), with a little calculus, it will be seen that the ratio: Y_d/Y_d' , increases with the ratio: H/Y_d' . Thus, when H increases, the former will increase leading to an increase in $P(1/2)$ because $\text{Prob}(y < Y_d)$ remains fixed at $(1 - d)$. When Y_d decreases, $P(1/2)$ for the same reason will tend to increase.

Notes

[It is not easy for a solitary research worker like me to carry out a statistical study such as this without help which I received in generous measures from past and present government officials and friends. V B Mujumdar, director of economics and statistics of the Government of Maharashtra (GOM), readily provided me with data on rainfall in the state and that too with some preliminary processing. R H Patil and W D Bhide, retired superintending and chief engineers of GOM respectively, took interest in the problem, clarified its technical aspects and provided me with the necessary material. D A Mooley, former scientist of the Institute of Tropical Meteorology, Pune, was generous with his time and gave me the benefit of his experience of the statistical work he did on rainfall distribution. Very importantly, he provided me with the formulae for working out the incomplete Gamma integral without which the exercise could not have been done with ease. A large part of the complicated computational work this study entailed was not possible but for the use of a PC which my friend V J Puntambekar kept at my disposal with considerable technical input of his own. I am grateful to all of them for their enthusiastic support to this work. Needless to say, any errors in it are mine.]

1 Basically, three formulae are in use, with rainfall y , in inches
By Inglis' formula for non-ghat catchment:
 $R = y(y - 7)/100$ inches
The other two, Binnie's and Strange's formulae are in the form of tables which give R and Q for values of y . For the range: 15" to 30" (375 to 750 mm), I find after some derivation that Binnie's formula: $R = y(y - 3)/100$ inches, and

Strange's formula: $R = \text{constant} \cdot y^{1/6}$, $y = 6.6568/100$ inches give exactly the values in Binnie's table and very good approximations of those in Strange's table. For rainfall below 15", the formula gives exact values in the former table but underestimates those in the latter, leading to overestimation of DR slightly. The latter classifies catchments in three classes. Good, average, and bad, the value of the constant is 1.1267 for a good catchment, and 0.75 and 0.50 time this value for the average and bad catchment respectively. For a particular catchment the relative magnitudes of R and Q are unaffected by the value of the constant. Thus the structure of the three formulae is the same with H taking three values: 3", 6.6568" and 7". There is a small variation though, y is total monsoon rainfall in Strange's table and total annual rainfall in the other two. Inglis' formula for ghat catchments is not, I think, applicable to low rainfall areas and hence not considered (Ref: Minor Irrigation Manual, Government of Maharashtra, I and P D, 1966)

- 2 The average absolute deviation of v from V is $(1-d)(V - \bar{v}_1) + d(V - V) = (1-d)(V - \bar{v}_1)$ and relative to V, the average deviation equals $(1-d)(V - \bar{v}_1)/V$ which by equation (11) equals DR
- 3 Dhawan (EPW, October 23, 1993) also acknowledges the expected inverse relationship between the mean and the CV
- 4 In a year when rainfall was less than H, v, which cannot be negative, was taken to be zero, but the year was counted for calculations. The same rule was applied to calculations based on the Gamma distribution
- 5 Instead of counting frequency 1(one) for any observed value of rainfall, a frequency of 0.5 was reckoned below that value and another 0.5 above that value. The numbers in the first column of the table also stand for the cumulative frequencies, and they were, as a result, taken as: 0.5, 1.5, 2.5, etc., for successive rainfall values before interpolation.
- 6 A substantial part of computation was done on a hand-held programmable calculator. To keep the number of decimals comparable, M was read in dm; on second thought, I should have read it in cm. The log-linear equation would be more appropriate because of the underlying model of rainfall distribution and the far from simple manner in which DR gets determined
- 7 In the paper: Distribution Function for Seasonal and Annual Rainfall over India, by D A Mooley and G Appa Rao, Institute of Tropical Meteorology, Poona-5, India, published in Monthly Weather Review, US Weather Bureau, Department of Commerce; Vol 99, No 10, October 1971
- 8 The probability density function: $f(y)$, of the two parameter Gamma distribution is $f(y) = \text{Constant} \cdot y^a \cdot \exp(-y/b)$, $y \geq 0$. Its mean = $b(a+1)$, and $CV = 1/(a+1)^{1/2}$. Given the values of the mean and the CV, a and b are estimated from these equations. Mooley and Rao however, employ a more sophisticated method of maximum likelihood estimation
- 9 The calculations involve incomplete integrals of the Gamma distribution which were done by formulae Mooley provided.
- 10 The paper at (7); the values of mean and SD are given in its Table 3 and the sample

number of observations in Figure 1, which were read with a magnifying glass.

- 11 See Dhawan at (3).
- 12 This assumes additivity; however, as stated later in the paper, some interaction is present
- 13 These are not strictly regression equations because the Table 9 gives the exact values. The value of R^2 is given only to indicate the degree of approximation
- 14 The Report of Maharashtra Irrigation Commission (1962), published by Government

of Maharashtra (1963); paragraph 2.5.1 (Marathi).

- 15 The latter also equals $100(DR' - DR)/(1 - DR)$
- 16 My information is that engineers work out run-off by alternative formulae and use the safest (i.e., the lowest) value in designing a project. As a result, the actual dependability factor may be different - a little higher perhaps - than the planned

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

INDIAN SOCIALISTS : SEARCH FOR IDENTITY

Sonal Shah

This is an analysis of the frequency and magnitude of the splits suffered by India's Socialist Party, after independence.

The term Socialist Party encompasses the Congress Socialist Party and its various offspring — the Socialist Party, the Praja Socialist Party and the Samyukta Socialist Party.

In a period of 17 years, between 1955 and 1972, the party underwent four major splits and mergers and during this time was reduced from being one of the principal opposition parties in India to a small and inconsequential one.

This book reviews the history of the socialist movement since its inception in 1934. It provides an insight into the quality of the leaders, their differences, the ideological perceptions of the Indian socialists in general, the influence of the Congress Party and Jawaharlal Nehru on opposition politics, particularly on the socialist movement and the struggle for power which a small party within a one party dominant system faced.

The leaders of the Socialist Party — Acharya Narendra Dev, Jayaprakash Narayan, Dr Rammanohar Lohia, Achyut Patwardhan, Acharya Kripalani, Asoka Mehta, S.M. Joshi, N.G. Goray — played a vital role during the freedom struggle and influenced many events in Indian politics. And yet the movement (started and led by them) has all but frittered away. What led to this state of affairs? Why has this been the fate of many other opposition parties? These are the questions which haunt many political observers.

For anyone who wishes to understand Indian politics in a proper perspective this book is indispensable

ISBN 81-7154-699-4 demy hardbound xvi + 194pp Rs. 250.00

Sonal Shah (b. 1955) has a doctorate in political science from Bombay University. At present she is connected with *Jhanta*, a weekly magazine with democratic socialist leanings, which was once the organ of the erstwhile Socialist Party. Her parents Dr. G.G. Parkhi and Mangla Parkhi have been actively involved in the socialist movement for several decades. Dr. Sonal Shah had been privileged to witness socialist politics from first-hand — and from a very young age.

China's Tryst with Globalisation

Rejecting neoliberal diagnoses, China has created a transitional economic system that combines in a most original way seemingly contradictory elements of central and local planning, the domestic market and a relatively small window looking out into the world outside. Above all, China's experience illustrates most vividly the contemporary relevance of 'economic self-reliance' as the motor of growth in a developing country.

PE-2

Colonial Ethnography

The task of re-examining colonial ethnography and demystifying and exposing the colonial conspiracy is far from easy, especially when post-colonial scholars remain captives of the premises of colonial soldiers, administrators and ethnographers. The crucial issue is to bring out the extent of enmeshment of ethnographic reports with imperial power as reflected in colonial brutalities to silence the indigenous peoples' struggles for autonomy, survival and independence.

220

Undoing of Green Revolution

The current internationalisation of capital has the effect of transforming the state into a 'transnational state' in which domestic, social and political relations are increasingly shaped by global capital circuits. In contrast to the green revolution period, the current phase of internationalisation of agribusiness impedes the ability of third world states to formulate self-sustaining and pro-poor agricultural policies.

How Will Muslims Vote?

A survey of Muslims in Bombay brings out the strong anti-Congress sentiment prevailing in the community. Irrespective of the Ulema council's directive, a majority of Muslims are for an alliance with Hindu backward caste political forces.

197

Two Cultures

Getting time and uncertainty into economic theory has truly been a pons asinorum of mainstream economics, with even the most elegant model that we have, that of Arrow-Debreu, being essentially static. In this context it has been a tragedy for economics that its practitioners have resolved themselves into two distinct compartments, those who indulge in high theory and others who dirty their hands with empirico-computational work.

PE-31

Beyond Food 'Surpluses'

The present phase in our economy and agriculture is indeed an appropriate time to give serious thought to the past performance, present status and the priorities for the future directions of change in the food security system.

215

Cardboard History

With the divine blessings of Jayalalitha, the eighth world Tamil conference in Thanjavur concluded successfully, showering praise on its patroness. The distinguished participants demonstrated their scholarly disengagement from the world of *realpolitik* by maintaining a cautious silence about the deportation of their colleagues from Sri Lanka.

201

Value in Negation

The value of postmodernism derives from its power of negation. Its critique of objectivism and the 'metaphysics of presence' offers a new philosophical framework within which elements of the early critiques of enlightenment/modernity can be incorporated and given a more comprehensive form and analytical depth. However, when the concepts employed in the critique are transformed into affirmative norms, they yield an attitude of scepticism and nihilism within which every kind of 'coherent' and 'meaningful' enquiry becomes suspect.

PE-45

Premature Obituary

The dismissal of Marxism as either an intellectual tool or a potentially politically relevant force in the contemporary world is profoundly mistaken. The collapse of bureaucratic collectivism in central and eastern Europe in fact signifies the definitive vindication of Marxism in theory and political practice.

LETTERS TO EDITOR

Pleasing the Master

SOME five years ago Ashok Rudra had enunciated in this journal his thesis on the emergence of the intelligentsia as the third ruling class in India. Were he alive today he would have definitely felt compelled to revise his thesis to add that not only has the intelligentsia emerged as the third ruling class but, like the dominant partner of the erstwhile ruling class combine of big bourgeoisie and landlords, has acquired strong compradore characteristics as well. Watching the proceeding of a 'seminar' on Indo-US Relations at A N Sinha Institute of Social Studies (ANSISS) in Patna on December 14 last, one was consistently haunted by this thought.

ANSISS, one of the premier research institutions of its kind in the country, can boast of having had such illustrious scholars on its faculty as A K Das Gupta, R N Maharaj, Pradhan H Prasad and Sachidanand, to name only a few, all known not only for their intellectual achievements but equally for their integrity, independence and academic honesty. This institution once upon a time had seen these traits reaching such pinnacles of glory that one of the economists of this institute did not feel shy of presenting a damning indictment of the Sarvodaya Programme even though the leading light of Sarvodaya movement, Jay Prakash Narayan, happened to be the chairman of the institute. Such academic integrity alas is a thing of the past now.

The main speaker in this so-called seminar was E T Emree, advisor to the US Ambassador in India. The gathering at the seminar was bigger than any of the seminar held at ANSISS in recent times. After Emree had given his long sermon on how much the US valued democracy, civil liberties, human rights and all the virtues on this earth and how India was its natural partner even though it figured quite low in the list of foreign policy priorities of the US, those present, and they included leading lights of ANSISS, Patna University and other intellectual stalwarts of the city, presented a show as if they were vying with each other to please the virtuous speaker from the land of all 'virtues' in the world. Emree was showered with encomiums – 'how true', 'how noble', 'how kind' and what not.

Nobody remembered the ghastly bombarding of civilian targets in Iraq, the firings by the US army on queues of hungry people in Somalia, the events in Haiti, the inhuman embargo on food and essential life-saving medicines imposed against Cuba, the bloody interventions in Panama, the backing to military dictatorships the world

over, not to speak of the numerous killings and assassinations hatched by the CIA. All these were conveniently forgotten by the intellectuals assembled at the seminar hall of ANSISS on that wintry afternoon. The only thing that the 'distinguished' gathering seemed to remember was that an 'angel' from the lord of the world was there and he had to be pleased. So all of them waited in the wings to have some crumbs thrown by the angel in the form of grants, projects and so on.

The only one who stood up in the end and modestly challenged Emree's sermons was promptly damned as a confused man by the one presiding over the 'seminar'. Nobody in fact had the patience to listen to this man. After all in this gathering of distinguished intellectuals, he was a rank junior having no credentials, such as voluminous books or scores of papers, to his credit to call himself an intellectual except that he was a teacher of economics in Patna University. And in any case it was already getting dark and the distinguished gathering's attention had now shifted to the high tea financed by US dollars that awaited them outside the seminar hall. And if this man was to be allowed to continue, with the 'nonsense' which he was 'pontificating' it would have displeased the white master and the expected dollars would have been threatened. So the man presiding over the seminar promptly drubbed this speaker as "a confused man wallowing in his numerous confusions".

Next day the newspapers dutifully reported the sermons of Emree making no mention at all of the person who stood up and got damned as a confused man. Later on in the day, the same crowd of intellectuals was seen chattering over the noble views of Emree and making jibes about the 'confused man'.

The entire jamboree underlined one thing – the intellectuals of this supposedly great land have lost a modicum of self-respect and have acquired strong compradore traits.

Patna

Socialism or New Democracy?

DULY bemused as we are by post-Foucauldian wisdom, we refuse to see in the striking juxtaposition of a vituperative letter on 'non-class socialism' by Prabodh Dutta of Calcutta and another letter on the crucial question of a 'mass struggle' from Niranjana Phukan (*EPW*, December 3, 1994), the trace of any agency. But surely,

in a climate where democracy has come to mean the right of might alone and sane reason is often buried under vulgar abuse of childish spite, one expects a modicum of fair play from a journal devoted to social justice.

It is clear that Phukan has not espoused any variety of non-class socialism at all, though he has not cared to spell out the class angle for the benefit of diehard dogmatists. In fact, he has pleaded for a series of mass campaigns for a people's democracy.

Unlike Dutta, Phukan does not assume that India is a full-fledged and stable bourgeois democracy. In fact the combination of feudal and imperialist support continuously sabotages its democratic pretensions. Hence, the goal of people's struggles should be a people's democracy, a genuinely democratic constitution against the designs of imperialism and feudal interests.

Phukan proposes that the left lead the struggle, freed from its bondage to parliamentary criticism and adventurist violence. The masses to be led are not merely the working class, but an alliance of what he calls 'the oppressed classes'. In a country where smaller nationalities, the minorities, and the petit – bourgeois are among the oppressed, and where the concept of law itself remains confused, even a struggle for genuine democracy has revolutionary implications.

Dutta's lack of understanding stems from a sterile dogmatism of the left that can neither learn from its past mistakes nor can make creative applications of received ideology to Indian situation. People like him find themselves surrounded by narrowing walls of a dream of pure socialism which they do not know how to turn into reality. Frustration leads to accumulation of impotent spite and lunatic fury revelling in imaginary atrocities on their critics. The fear of the new goads them ultimately into the arms of their traditional enemies.

A Correction

In the article 'Arunachal Pradesh: Tension over Chakma Issue' (December 31, 1994) on page 3312, column 2, the period of the Assam movement was wrongly mentioned as 1985-90. It should read 1979-85. The error is regretted.

Ed.

At Stock Market's Mercy

THE precipitate fall in equity prices on the Indian stock exchanges in the past four months or so should not be a surprise to a keen observer of the stock market scene. The post-scram buoyancy in share prices up to September 1994 and the subsequent retreat have been dictated by the actions of foreign institutional investors (FIIs). Even the steps taken by the authorities in recent months in introducing various regulations with a view to enforcing a degree of discipline on the markets have essentially been guided by the adverse reactions of the FIIs to the various questionable practices and structural problems of the Indian stock market system.

Initially, the FIIs had swarmed in when there were both push and pull factors in operation. Low interest rates in the US accompanied by the persistence of recessionary conditions in Europe induced the FIIs to look to the emerging markets in Asia for portfolio investments. The offer of an attractive 20 per cent tax rate on investment income and 10 per cent on long-term capital gains was made by the Indian finance minister in 1992-93, but the FIIs began making sizeable investments in the Indian markets only in the July-September quarter of 1993 when share prices began to look up. The BSE sensitive index (base: 1978-79 = 100) which was around 2,200-2,300 between end-March and end-July 1993, with average price-earning ratios of shares ranging from 28 to 32, shot up to 3,346 (or by 52 per cent) and the price-earning ratio to 40 by the end of December 1993. Thereafter, for about nine months up to September 1994, FIIs' investments, and consequently share prices, rose sharply. During that nine-month period the FIIs made gross purchases worth as much as Rs 7,265 crore or an average of Rs 807 crore per month. Correspondingly, equity prices as represented by the sensdex touched a peak of 4,618 on September 16, 1994, registering a rise of over 110 per cent since mid-March 1993 and taking the P/E ratio beyond 48. The daily turnover of the Bombay stock exchange galloped from Rs 163 crore in June 1993 to Rs 1,010 crore in December 1993 (partly due to PSU shares); it remained high at Rs 384 crore and Rs 340 crore in August and September 1994. There was a spectacular rise in market capitalisation of BSE-quoted shares from Rs 1,60,952 crore in April 1993 to Rs 4,46,884 crore in August 1994, a rise of 178 per cent.

Then came a series of adverse factors, on both the pull and push sides. Quick and sharp increases in US interest rates and economic recovery in the industrialised countries reduced the incentives for fund managers to move to the Asian emerging markets. In India there occurred some major micro and macro developments which went to reinforce the FIIs' natural inclination to be fair-weather friends. First, it was time for the FIIs to book profits in those investments which had crossed the

12-month lock-in period to qualify for the low long-term capital gains tax of 10 per cent. Then in October 1994 came the private placement of 7 per cent Reliance Industries (RIL) shares worth Rs 900 crore mainly with the UTI, followed by the merger of two subsidiaries with RIL in early November, which shocked foreign as well as domestic investors insofar as transparency in share transactions was concerned. There was in consequence a quick fall in GDR prices of Reliance and other companies quoted abroad. And as these developments coincided with the calendar year closing for the FIIs, there was a sharp decline in their investment. From Rs 648 crore in September and Rs 611 crore in October 1994, their gross monthly purchases came down to Rs 808 crore in November, Rs 364 crore in December and Rs 316 crore in this January (up to January 20). More than the decline in gross monthly purchases, it was the steady rise in gross monthly sales by FIIs that brought down their net investment. The FIIs' sales went up from Rs 108 crore in July 1994 to Rs 316 crore in December and Rs 233 crore in January (up to January 20), as a result of which their net investment fell from Rs 755 crore in June 1994 to Rs 345 crore in October, Rs 34 crore in November, Rs 48 crore in December and Rs 84 crore in January so far.

The decline in FIIs' investment has been reflected in steady losses in equity prices and a general slackness in market activities. The sensdex dipped to 3,411 on January 24, registering a fall of nearly 25 per cent from the peak of 4,618 reached in September 1994, with the price-earning ratio touching a low of 30. The average daily turnover slipped from Rs 441 crore in October 1994 to Rs 250 crore in December 1994 and has slumped to less than Rs 200 crore so far this month. The FIIs' disinclination to make substantial commitments has made the authorities sit up and initiate a few long overdue steps to discipline the market, which have in turn dampened the speculative activities of share brokers. Apart from banning the archaic *badla* system, the government has insisted on corporate bodies retaining abroad the proceeds of their GDRs and Euro funds till these proceeds can be used for project financing in India. Further, with the ban on *badla* transactions, brokers' attention shifted to cash scrips in which the daily turnover has expanded significantly. In 1993-94 the total turnover in group A or specified shares was Rs 62,213 crore against Rs 22,324 crore in group B or non-specified shares, or 36 per cent of that in group A scrips. The tables have been turned in 1994-95, with the turnover in the group B shares overtaking that in group A shares. In September 1994, the turnover was Rs 1,540 crore in group A and Rs 6,558 crore in group B, or 425 per cent of that in the former. Even in December 1994, when share prices and general share market activity suffered a setback, the respective

turnovers were Rs 680 crore and Rs 4,248 crore. Apart from the PSU shares being now traded as group B securities, a major factor has been the repeated renewal of transactions as a backdoor form of badla by brokers with the connivance of the stock exchange authorities. Renewals have reportedly increased from about 20 per cent of transactions to over 40 per cent, with some select cash scrips crossing even 80 per cent, forcing SEBI to ban renewal of transactions in non-specified shares and insist on the seven-day settlement procedure. SEBI has also insisted on strict segregation of clients' and brokers' accounts as required by the government notification amending the BSE by-laws effective from December 5, 1994. Finally, in the face of the sharp fall in share prices following the reduced net investment by FIIs, the government has, through an ordinance, opened the doors to the writing and trading of options in stock markets and substantially strengthened the regulatory powers of SEBI over capital market intermediaries as well as corporate bodies insofar as they concern the issue of capital, transfer of securities and other related matters.

While some of these measures were long overdue and hence are to be welcomed, what is objectionable is that the government's actions are being increasingly guided by short-term considerations. In the present instance, the overwhelming concern is about the FIIs' investments. This approach is seriously flawed from the viewpoint of the long-term development of the capital market. In the first place, options trading is an independent derivative essentially intended to enhance speculation based on average price variations of a composite set of scrips or indices of scrips. Apart from the fact that the scope for rigging prices is all the more in the Indian situation as the volume of transactions is not only not large but also now distributed between three major exchanges, the crying need is to address questions of basic reform such as the introduction of depositories and screen-based transactions so as to ensure transparency and essential disclosures.

At a more fundamental level, the government has still not realised the dangers of relying on FIIs for boosting share prices. Such portfolio investment is both expensive and volatile. The volatility can hurt the process of capital market development. In the long run, a healthy market is one in which prices are set by the fundamentals of the economy and by investment emanating from cash flow of corporate bodies and saving of households. Even injection of bank money may at times create unsettled conditions in the market, as happened during the scam. Excessive dependence on portfolio investment may also tend to artificially heat the market, as happened in September 1994 when share prices surpassed even the peak of the scam. Further, financial structures of companies may tend to get distorted with overwhelming dependence on equity

financing even for working capital purposes - a phenomenon noticed in the recent past. Detailed studies of the experience of different countries have shown that stock market exuberance does not serve any macro-economic goal, whether generation of additional domestic saving or more efficient allocation of investment or even disciplining of corporate managements. Claims to these effect have been proved to be myths. Instead, excessive stock market activity encourages corporate bodies to expand or diversify through takeovers and similar devices rather than through organic growth making for long-term economic development. The stock market-dominated economies of the US and UK have found themselves at a competitive disadvantage *vis-a-vis* the economies of Germany and Japan which prospered with bank-based financial systems. The perverse aspects of stock markets can hinder corporate sector development, particularly in developing countries where entrepreneurship has a strong bias for trading. India is certainly no exception to this.

CONGRESS PARTY

Cynical Game

DESPITE his attempts to put a brave face on his suspension from the Congress Party, Arjun Singh must be conscious deep down of the risks of his political gamble. For all his talk of mobilising support by working among common Congress activists, he knows very well that he cannot make any dent in the party anywhere without sustenance from the provincial Congress 'satraps'. The latter are divided and are only too willing to throw in their lot with the highest bidder. Prime minister Narasimha Rao, being in power, is in a more advantageous position than Arjun Singh in distributing largesse. The mood among Congress workers and middle-ranking leaders was summed up by one such leader from West Bengal recently who was reported to have said that if Arjun Singh achieved anything they would be behind him, otherwise they would forsake him. What else can one expect from a party which is totally devoid of any ideology, and has become a bloated body of corrupt leaders and lumpen activists?

Since his suspension from the primary membership of the party debars Arjun Singh from campaigning in the coming elections, he will have to bide his time for any effective intervention till the elections are over. During the elections, he and his followers may do their best to ensure the defeat of Rao's candidates - in order to demonstrate that the party under Rao has collapsed and therefore needs a new leader (in the form of Arjun Singh). But it is doubtful whether, even if the Congress is defeated in most of the six states, Arjun Singh will be accepted as replacement for Rao. There is too much of jockeying for the top position among the ageing leaders of the Congress. Sharad Pawar, one of the claimants, has already

blamed Singh for "exceeding limits". The Kalpnath Rais and the ND Tewaris who are now supporting Singh may well evaporate in the next stage in the tussle for power.

The other option for Arjun Singh then is an honourable exit from the party with a chunk of followers. By clamping a show-cause notice on him, paving the way for his eventual expulsion, Rao has in fact pushed him to the wall. We might therefore see the mushrooming of yet another Congress Party - a Congress(A) perhaps? What are the prospects of such a rump headed by Arjun Singh in the next general elections?

By accusing Rao of compromising with the Hindu chauvinist forces on the Babri masjid issue, Arjun Singh hopes to win the Muslim constituency. By playing on the popular resentment against corruption, he is perhaps dreaming of emerging as another Jayaprakash Narayan, harking back to the 1974-75 period. By harping on the alleged suppression of evidence and delay in the Rajiv Gandhi assassination case, he is trying to ensure the support of the enigmatic lady at 10 Janpath and the Rajiv loyalists within the Congress Party. By shedding tears over the plight of the people due to Rao's acceptance of the economic liberalisation policies, he expects the Left to support him.

But on all these counts in his multi-pronged electoral strategy, Arjun Singh stands on a sticky wicket. First, the Muslim leaders appear to be sceptical about his rather belated conciliatory gestures towards their community. One of them, Ebrahim Sulaiman Sait, the convenor of the All-India Muslim Personal Law Board, has dismissed these gestures of his as coming "two years too late", and has demanded nothing short of the rebuilding of the mosque at its original site. Can Arjun Singh afford to make that promise and carry it out - if he is voted to power? For all his anti-BJP rhetoric, and pretensions to secularism (which are calculated to woo the Left), in practice he has always been careful to adhere to the traditional superstitious Hindu practices (like expensive 'yagnas' and obeisance to god-men) in order to ensure support from the Hindu vote bank in north India. As the minister for human resources development in the Rao cabinet, his last act of compromise with the Hindu chauvinist forces was his advice to the foreign delegates to the World Archaeological Congress in Delhi to refrain from bringing up the issue of the destruction of the Babri masjid at the conference.

As for the other issues which Arjun Singh has raised in his campaign against Narasimha Rao - whether the question of corruption or that of the ill effects of the economic liberalisation - he had been a part of, and a party to, all these developments during the years of his tenure as a member of the Rao cabinet. If he was all that conscientious, he should have resigned much earlier - in 1992 when Rao allowed the Hindu fanatics to demolish the Babri masjid, or when he felt that Rao was shielding corrupt politicians (one of them being Kalpnath Rai who, after

being dismissed from the cabinet, has now snuggled up to Arjun Singh).

Given this dubious political background, it is doubtful whether Arjun Singh will be able to carve out any significant niche for himself in the configuration of political forces that may emerge following the coming assembly elections.

POVERTY

Removal by Definition

DOES anyone believe that unemployment in India is around 2 per cent only, whereas the proportion of persons below the poverty line is close to 41 per cent? But that is precisely what is thrown up by National Sample Survey data for the period January-December 1992.

That experts in this business of numbers have themselves been uneasy about the credibility of the figures of unemployment, which the NSS surveys yield is evident from the attempts from time to time to not only refine concepts but introduce new ones. The two concepts of unemployment that have by now come to stick and be widely accepted are 'usual status' and 'weekly status'. The former is supposed to capture the number of those unemployed most of the year and the latter those unemployed in the week preceding the survey, with the latter considered possibly more reliable than the former on the assumption that recall time is shorter for the respondent. And the two measures do yield different results. Thus while the figure for male unemployment by usual status works out to 1.9 per cent for 1992, by weekly status it goes up to 2.8 per cent, which means that measured by weekly status the unemployment level turns out to be over 50 per cent higher than that measured by usual status. Nonetheless, it comes nowhere near the estimated proportion of persons below the poverty line. Hence, the question of credibility of the unemployment estimates.

With poverty level as high as it is, and virtually refusing to contract despite the much touted budgetary allocations for employment generation and anti-poverty programmes year after year, the question of attempting reasonably credible estimates of unemployment must be faced squarely. Or is it that such an attempt has to be abandoned altogether? In any case, the present farcical scenario conjured up by NSS data of very low unemployment co-existing with very high poverty levels is becoming increasingly laughable. A concept of employment will have to be evolved that takes note of the fact that a large proportion of the workforce in the country is driven to take up work, however demeaning and low paid, because the alternative before them is to starve and see their families starve. To consider such people as employed is to make a mockery of the very concept of employment. Employment has to be at a certain level of earning.

It is ironic that the attempt so far has been not to arrive at a credible concept of employment but to dilute the concept of the poverty level by introducing the notion of two square meals a day in order to find out if the poor also starve, as if a square meal is easy to gauge and poverty is not. Interestingly, measured by the yardstick of two square meals a day, the proportion of those thus deprived in rural India was supposed to be less than 1 per cent in 1992 which is lower than the proportion of men unemployed by the usual status. By such statistical jugglery unemployment and poverty can be proven to have vanished from India. But to what purpose?

BIHAR

Caste Equations

WHAT is remarkable about Laloo Prasad's government in Bihar is its completion of the five-year term of office without any disruption. This is an achievement given the fact that for past two decades and a half no government in the state was able to endure so long. Thus, despite the various gibes in the press about Laloo's style of functioning, people in Bihar have experienced political stability after a long time. That Laloo Prasad still claims considerable support in the state was evident in the mammoth garib rally he organised in Patna in October, last year. The rally was also a show of strength directed at the rival Samata Party which a couple of weeks earlier had at the same site of Gandhi maidan held a Jan Adalat for 'Bihar Bachao'.

It was the politics of the backward castes that bestowed the chief ministerships of the country's two most populous neighbouring states on two yadavs. Though Uttar Pradesh went through turbulent political upheavals, including the drifting apart of Mulayam Singh from V P Singh's Janata Dal(JD), Bihar continued to be the latter's bastion. But the politics of the backward castes in effect consolidated caste politics in the states. The kurmis and the koers, led by Nitish Kumar's Samata Party, a breakaway group of the JD, have accused Laloo Prasad of 'yadavisation' of Bihar's polity. Incidentally, both Laloo Prasad and Nitish Kumar are contesting elections from constituencies having a strong base of their respective castes. Danapur and Raghapur, from where Laloo Prasad has filed his nominations, are yadav-dominated areas while Harnaut, Nitish Kumar's seat, has a solid kurmi presence. But the so-called yadavraj will be toppled only if anti-Laloo forces in the state reach an agreement amongst themselves. And this is nowhere in sight. Virtually every opposition alliance in the offing has broken down. Samata Party and CPI(ML) have parted ways due to disagreement over seat distribution. Samata Party itself has suffered a split with Ram Sunder Das, a former chief minister, initiating the Loktantrik Samajwadi Morcha. The deliberations between the SP-BSP combine and Jharkhand Mukti Morcha

(Soren) have flopped. The Congress, the BJP, and the new-born Bihar People's Party (BPP) are to contest separately. Interestingly, the only alliance that survives is between Laloo Prasad's Janata Dal and the two communist parties, CPI and CPI(M). Laloo Prasad exerts a tight grip over the yadav-Muslim block which forms 30 per cent of the voting population. He has unsettled the base of his communist allies too. When the two communist parties launched a land-grab movement in protest against the government's failure to address the land problem, Laloo simply asked the yadavs in the communist fold to disown their parties. Further, the growing support to the Vinod Mishra-led CPI(ML) in north and central Bihar has left the CPI and CPI(M) with no option but to seek *rapprochement* with Laloo.

The real challenge to Laloo Prasad's dominance will be in south Bihar. On December 20, 1994 a bill was passed in the Bihar assembly constituting an autonomous council for the development of 18 districts of Chhottanagpur and Santhal Parganas of Jharkhand. Bolstered by what it sees as a vindication of the party stand, JMM(S), an adversary of Laloo Prasad, has decided to contest all the 82 seats of south Bihar on its own. Laloo had alienated the tribal population of south Bihar by declaring that the separate state of Jharkhand would be formed only over his dead body and the JAAC bill and the announcement of 76 per cent reservations for tribals may not have compensated for their ire.

Among the conservative forces in Bihar, it is Anand Mohan Singh's BPP, and not the Congress or the BJP, that has captured the imagination of the upper castes in Bihar. It is reported that the bhumihars and the rajputs who dominate Muzaffarpur and Vaishali districts of north Bihar have gravitated towards this party. The murder of Choten Shukla, a prominent party activist, in December and the lynching of the district magistrate of Gopalganj, a dalit, in retaliation have added to the polarisation of caste forces in the state. The Congress, the largest opposition party in the outgoing assembly, is destined to sink further. The party's state leadership is factionalised beyond remedy. Jagannath Mishra's 'non-political' drive against economic backwardness of the state could not inspire even his party members into action. The BJP, on the other hand, constrained by the code of electoral conduct, is banking on criminalisation of state politics and the infiltration of Bangladeshis - issues that have failed to arouse the public.

Laloo Prasad Yadav's success in challenging the election commissioner over the issue of photo identity cards has dwarfed all his rivals. Though the opposition parties may cry themselves hoarse over the financial mismanagement of the state, the fact is that the state has always been mismanaged. It is the security and dignity that Laloo has been able to give the backward castes and the Muslims that is new.

Breakfast Revolution

A correspondent writes:

THE opening of the economy has cleared the way for the invasion of the Indian market by foreign branded food products. Between August 1991 and September 1994, 290 foreign collaboration projects were approved in the food processing sector, with proposed investments totalling Rs 1,836 crore, of which Rs 700 crore are estimated to have already entered the country. Foreign companies have apparently been animated by the government's propaganda that India's 'growing middle class' is ready and able to purchase their products. Even if one sticks to the urban middle and upper classes, there is a large and tempting market for foreign food and pseudo-food products, not to mention consumer goods in general. Foreign firms have the resources to spend heavily on advertising and marketing, and we are already witnessing their onslaught, particularly of foreign liquor brands. The wave of the future for the marketing of foreign processed food products can be seen in the launching of Kellogg's ready-to-eat breakfast cereals (corn, wheat and rice flakes) recently in the Bombay market.

With a total project cost of \$60 million, Kellogg India (a 100 per cent subsidiary of the American Kellogg Company) may have to wait a number of years to see a profit, but company officials say they are in for the long haul. Initial market survey results were discouraging – a survey of 17 million urban households by the Indian Market Research Bureau (IMRB) found that the penetration of cold cereals in the market is only 3 per cent at present, while 12 per cent of households eat bread for breakfast and most prefer hot foods such as 'dosa' and 'paratha'. But Kellogg's own market research convinced it that the Indian urban middle and upper classes are becoming more 'health-conscious' and so may be willing to give up their traditional 'greasy' breakfast fare for 'nutritious' Kellogg's cereals, 'fortified with vitamins and iron'. Thus its marketing strategy is concentrating on the health aspects of the product.

Many feel that Kellogg will have an uphill battle to convince consumers here to eat its cereals for breakfast, but the company has plenty of experience in creating a market for its products in countries where food habits are very different. It will use that experience, plus money power, to good advantage here. It plans to 'educate' the consumers through advertising that targets parents, teachers and doctors, and to organise programmes in schools to promote its products. This strategy indicates that the real eventual target will be children, as in the United States – the company also plans to launch 'Frosted Flakes', a sugar-coated variety of corn flakes popular with children.

It is ironic (but not surprising) that with increasing health consciousness in the US

leading consumers to turn away from such heavily processed foods, especially for children, Kellogg is trying to open up the Indian market on the plank of health foods (much as cigarette companies are turning to third world markets as first world consumers are giving up smoking). American nutritionists discourage parents from buying breakfast cereals for their children because the sweetened varieties are little better than junk food. The main consumers of cold cereals abroad are probably children, given the profusion of super-sweet brands with numerous strange flavours and shapes, and the producers aim their advertising directly at children via television. While Kellogg could make a case for plain corn flakes or wheat-based cereals as healthy foods, its role in spoiling the diets of millions of children in the US and elsewhere with its children's brands of cereal cannot be denied. In any case, a traditional Indian breakfast, be it 'dosa' or 'paratha/subzi', is by no means less nutritious than a bowl of processed and chemically preserved grain soaked in sugar and a little milk (which also has fat, after all), and it is certainly cheaper.

It remains to be seen whether Kellogg will succeed in changing Indian eating habits. At present its significance is minor – after all, only a small segment of the population can afford to buy its products. But those who think that Indian tastes cannot be changed should recall that the national habit of drinking tea was introduced by the British authorities in collaboration with the tea companies with the explicit objective of providing a cheap, energy-giving drink to the toiling masses (and of course, of creating a new market for tea produced by British companies in India). Tea was heavily promoted in every corner of the country through slogans such as 'chai priyo, khoob din jiyo' which were pasted on walls and chanted by tea vendors, and by distribution of free packets. The result has been a decline in nutritional status as 'chai' has replaced the traditional glass of milk in the morning, even for children. Given this history, is it likely that the opening of the economy to foreign food brands will have a salubrious effect on the health of anyone, including the 'middle classes'? Already the road is being paved for the entry of highly processed foods in the market – the department of health had to change the rules to allow Kellogg to use BHA, an anti-oxidant, in its cereal.

Even in the US, the big food corporations had to create markets for their products through intensive advertising and 'consumer education', in the process changing dramatically the way Americans eat. The result is that the average American diet today is very unhealthy, with too many highly refined foods, too much fat and sugar, and too many artificial preservatives, colours and flavours. Even the US government recognises this fact, yet companies like Kellogg are allowed to push their junk foods at children, whose food preferences are still

being formed. Now that they have been allowed to operate in India, will the same companies behave any differently here?

POLITICS

The Real Issues

V P SINGH's prediction in New Delhi on January 20 that the country was heading for a coalition in 1996 is not much of a prophecy while his projection of this coalition as an anti-BJP line-up betrays a serious underestimation of the advanced socio-political reality of the time. That the present ruling power at the centre may suffer conclusive defeat due to its alienation from the people and sharpening political-factional dissensions within are too patent to be overlooked. But there is nothing on the horizon to indicate that the BJP can exploit this situation to emerge as the major challenger. With its *brahmastra* (the Ram Janmabhoomi-Babri masjid tangle) blunted and its inability so far to formulate any new fiction to hoodwink and bamboozle the masses anew, the BJP today is in no position to emerge as a major contender for power, even if one ignores the debilitating effects of the growing power struggles among its leaders.

More concretely and specifically, the BJP has little prospects in Bihar and the states to its east as also in Andhra Pradesh, Tamil Nadu and Kerala in the south. Even in Karnataka its share of votes declined in the recent assembly elections relative to that during the last Lok Sabha polls. If the recent municipal elections in Madhya Pradesh are any guide, its chances in that state are not bright either. Even if compared with these areas, the BJP fares a little better in the western and northern regions, there is hardly any possibility of its sweeping the polls in those states.

Against this background, the projection of the coming Lok Sabha poll battles as primarily an anti-BJP confrontation is entirely misconceived. Indeed, this is a sure way to demoralise the people or at least to ensure failure to galvanise them for a worthwhile political battle. The task dictated by the developing situation is to set an agenda before the people to achieve a secular-democratic, clean and ethically motivated alternative – a credible and viable third force – to defeat the corrupt, degenerate and servile Congress as well as the anti-national, anti-democratic, indeed fascistic BJP.

Unless the leading lights of the emerging third force themselves imbibe confidence and conviction in this realisable prospect, they cannot enthuse and mobilise the people for its realisation. Indeed, the key to the consolidation of this third force, that is, the weaning away of sizeable segments of the Congress edifice towards itself, is contingent upon the faith and conviction of the third force in its own victory. Statements such as V P Singh's can serve only to undermine this confidence.

Birla Advantage Fund

BIRLA MUTUAL FUND is entering the mutual fund business with the launch of an open-end scheme called 'Birla Advantage Fund'. The corpus of the fund is targeted at Rs 100 crore. The plan is to restructure the investment portfolio in such a way as to maximise capital gains for unit holders rather than provide annual income. Accordingly, the fund plans to invest at least 70 per cent of the corpus in equities. The balance is to be invested in debt and money market instruments. To provide transparency, the fund will announce the NAV of the fund on a daily basis and full details of the portfolio will be announced annually. Unit holders would be eligible for loans against units to be provided by Birla Global Finance. The fund has been sponsored by Birla Global Finance, formerly known as Birla Growth Fund, which belongs to the Aditya Birla group. The investment of the corpus is to be managed by Birla Capital International AMC which is a joint venture between the Aditya Birla Group and the Capital Group Companies of the US. The issue offer comprises 10 crore units with a par value of Rs 10 each. The issue is slated to open on February 17.

SRP Industries

A Lunar group company, SRP Industries has been successful in turning agricultural waste into pure silicate, giving various products including precipitated silica of highest purity. The process does away with the need for melting crystalline silica sand in a high power-consuming furnace and producing pollutant sulphuric acid. The amorphous silica is produced by reacting agricultural waste with caustic soda, which is recovered fully from the process. The company plans to implement the project which is scheduled to be on stream by the end of the current year. The 2tpd stream has already commenced production and seed marketing has been successful. To part finance this project, the company plans to enter the capital market shortly with rights cum public issues at a premium.

Essar Oil

Essar Oil belongs to the Essar group which has an asset base of about Rs 6,000 crore and an investor base of over 8,00,000 with interests in steel, power, shipping, financial services, trading and turnkey projects. The

company has been involved in the oil and gas sector in offshore construction and drilling and has recently been awarded three explicate blushes by GOI. The company, to finance the existing operations and the 9 mnt oil refinery project of Rs 5,350 crore, proposes to enter the capital market on February 7 with a simultaneous and unlinked straight equity issue of Rs 166.5 crore at a premium of Rs 35 and an Optional Fully Convertible Debentures (OFCDs) issue of Rs 1,649.99 crore at an average premium of Rs 37.5. The net offer of OFCDs to public is approximately Rs 714 crore.

The 9 mtpa world scale refinery project is being set up by the Essar group which has a proven track record of setting up mega greenfield projects such as its 2 mtpa HR steel plant at Hazira where trial production has commenced. The refinery project being set up at a project cost of Rs 5,350 crore will have one of the lowest capital and marketing costs for similar refineries internationally. The location being Vadinar, an all-weather deep-draft port in Gujarat, the refinery enjoys proximity to west Asian crude as also to the growing markets in north and west India and there would be easy accessibility to Indian Oil's Kandla-Bhatinda oil pipeline. The issue is to be lead managed by IDBI, ICICI securities and Finance Company, Enam Financial Consultants, SBI Capital Markets, IFCI, DSP Financial

Consultants, JM Financial and Investment Consultants Services.

Banaras Beads

Banaras Beads (BBL) is presently engaged in the manufacture and export of glass beads and imitation jewellery, woollen products and handicrafts. While manufacture and export of glass beads and woollen products are handled by the Varanasi division, handicrafts are being handled by the Delhi works. The company is entering the capital market on February 3 with a public issue of 22,16,000 equity shares of Rs 20 each at a premium of Rs 75 per share aggregating Rs 1883.60 lakh. The company owns three industrial plots in Varanasi along with 20,000 sq ft built-up area in New Delhi. It now proposes an expansion by additional civil construction in existing buildings for utility services in Varanasi plots. Also, acquisition of 17,000 sq ft for godown-cum-showroom in New Delhi is being planned. The jewellery project needs 17,000 sq ft for godown, workshop and office-cum-showroom. Also a godown-cum-showroom is being planned to be opened in Bombay. The company plans to incorporate computer aided design system for the glass beads and imitation jewellery division. The project has been appraised by IDBI and the total cost is estimated to be Rs 3559.58 lakh. The issue is to be jointly managed by IDBI, SBI Capital Markets and SM Finance.

CURRENT STATISTICS

EPW Research Foundation

The annual inflation rate, measured by any of the price indices, has further accelerated: 10.8 per cent by the WPI against 9.1 per cent in the previous 12-month period and 10.3 per cent by the CPI for industrial workers against 7.4 per cent. M₁ growth has slowed down due to moderation of expansion of net bank credit to government following a sharp contraction of RBI credit to the central government. However, bank credit to the commercial sector has begun to gallop, financed to an extent by disinvestment of trustee securities by banks. Reports suggest continued high gold import (official and clandestine) at 257 tonnes in 1993 and 262 tonnes in 1994, worth roughly Rs 12,000 crore each year.

Notes: (i) Superscript numeral denotes month to which figure relates, e.g., superscript 4 stands for April. (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year. (iii) - means not available/not relevant.

DEEPAK NITRITE

Rise in Sales

DEEPAK NITRITE, a market leader in nitration products that meet critical needs in dyes, agrochem and pharmaceuticals industries, has done well in 1993-94 with net sales increasing by Rs 21.84 crore (28 per cent), operating profit by 16 per cent and net profit by 119 per cent. There was a 43 per cent decline in depreciation and 60 per cent increase in other income. The company declared an enhanced dividend of 22 per cent against 20 per cent in the previous year.

Exports were up by 27 per cent (Rs 1.69 crore). Imports were also up by 33 per cent. Return on investment has been steady at 6 per cent in the past two years. Sundry creditors to current assets ratio has risen in the past three years from 19 per cent in 1991-92 to 21 per cent in 1992-93 and 23 per cent in 1993-94. Remuneration to employees after being steady in 1991-92 and 1992-93 rose marginally by 3 percentage points in 1993-94. Earning per share fluctuated at Rs 10 in 1991-92, Rs 4 in 1992-93 and Rs 9 in 1993-94. Exports to sales ratio remained steady at 7 per cent in the past two years. Debt-equity ratio fluctuated at 112 per cent in 1991-92, 118 per cent in 1992-93 and 92 per cent in 1993-94. Short-term borrowings to inventories rose sharply by 18 percentage points for the year as against 57 per cent in 1992-93. Net value added to value of production showed a decline from 23 per cent in 1991-92 to 21 per cent in 1992-93 and 18 per cent in 1993-94. Sales to total assets and sales to total gross fixed assets ratios showed increase in the past three years.

The performance of all the three divisions, i.e., nitrite, the sodium nitrite/nitrate, HAS, AN and GN, was commendable. However, nitric acid production and sales were under pressure due to competition from large producers having in-house ammonia production. Cost of power and fuel has gone up considerably and efforts are being made to overcome the impact through improved efficiency and better utilisation of existing capacity. The nitroaromatic division, despite stiff competition and considerable reduction in selling prices, has performed well due to increased capacity utilisation. The company's efforts in value addition have started yielding results. Sahyadri Dyestuffs and Chemicals division continued to work at high capacity in spite of increased competition in domestic and international markets. The dye-intermediate section in particular showed significant improvement.

The company invested Rs 11 lakh on R and D during the year, with the focus on improvement in yields of present products, new process for nitroaromatic-based downstream products and improvement in efflu-

ent treatment using bio-technological solutions. The department plans to develop nitration and reduction based technologies as a downstream activity to nitroaromatics.

IVP

Revived Demand

IVP has shown mixed performance with net sales declining marginally by Rs 1.67 crore (2 per cent) and operating profit by 17 per cent. But net profit was up by 20 per cent. Though other income was down by 35 per cent, non-operating profit was up by Rs 115 lakh (212 per cent), depreciation, interest charges and taxation were down by 38 per cent, 5 per cent and 24 per cent, respectively. This helped in holding margins up. A 20 per cent dividend was declared for the year against 17 per cent in the previous year. Net value added to value of production has increased from 13 per cent in 1991-92 to 20 per cent in 1993-94. Return on investment has declined marginally in the past two years. Turnover ratios have declined over the past three years. Sales to total assets declined from 164 per cent in 1991-92 to 138 per cent in 1992-93 and 128 per cent in 1993-94. Sales to gross fixed assets declined from 316 per cent in 1991-92 to 293 per cent in 1992-93 and 276 per cent in 1993-94. Sundry creditors to current assets fluctuated at 18 per cent in 1991-92, 16 per cent in 1992-93 and 19 per cent in 1993-94. Short-term bank borrowings to inventories increased from 84 per cent in 1991-92 to 101 per cent in 1992-93 and 116 per cent in 1993-94, while debt-equity ratio declined from 43 per cent in 1991-92 to 35 per cent in 1992-93 and 28 per cent in 1993-94. Exports declined by Rs 1.72 crore (73 per cent) against a 22 per cent fall in the previous year. Imports were also down by 6 per cent for the year.

In the next two years the company intends to invest Rs 30 crore on diversification, expansion and modernisation. With this the company expects to become broad-based, thus helping to improve profitability. With the engineering and chemical sector reviving after the recession, the company's products faced increased demand. To meet the growing demand and upgrade production facilities, the company proposes to make fresh investment. It plans to raise the required funds by making an issue equity share or convertible debentures, for a maximum of Rs 30 crore. The company has entered into two technical collaborations with Cerasiv GmbH, Germany, for manufacture of high alumina faucet discs, which is imported at present. The second collaboration is for upgrading and increasing the product range of the industrial ceramics division.

The company invested Rs 5 lakh on R and D activities. The department has been carrying on research with the focus on pro-

duct development, import substitution and technology upgradation.

SOL PHARMACEUTICALS

Rise in Exports

Sol Pharmaceuticals has performed excellently with net sales going up by 124 per cent (Rs 87.7 crore), operating profit by 170 per cent (Rs 14.88 crore) and net profit by 141 per cent (Rs 4.96 crore). Taxation increased by Rs 14 lakh, depreciation by Rs 126 lakh and interest charges by Rs 9.18 crore. But the effect was mitigated by the increase in other income from Rs 9 lakh to Rs 80 lakh and in non-operating profit from Rs 4 lakh to Rs 70 lakh. A 30 per cent dividend was declared for the year against 25 per cent in the previous year.

Exports were up by 399 per cent (Rs 45.71 crore) while imports were up by 127 per cent (Rs 28.42 crore). Debt-equity ratio fluctuated at 11 per cent in 1991-92, 154 per cent in 1992-93 and 27 per cent in 1993-94. Short-term bank borrowings to inventories ratio too fluctuated at 96 per cent in 1991-92, 87 per cent in 1992-93 and 89 per cent in 1993-94. Sales to total assets ratio declined from 135 per cent in 1991-92 to 124 per cent in 1992-93 and 94 per cent in 1993-94. Sales to gross fixed assets ratio also declined from 547 per cent in 1991-92 to 368 per cent in 1992-93 and 285 per cent in 1993-94. Growth in inventories fluctuated at 143 per cent in 1991-92, 60 per cent in 1992-93 and 230 per cent in 1993-94. Earning per share declined by 6 percentage points for the year. Net value added to value of production increased by 3 percentage points for the year.

The formulations division showed a growth of 34 per cent in the year. The company launched a new range of formulations in the domestic and international markets. The bulk drugs division has also done well with sales going up by Rs 74.85 crore. With the addition of the bulk drugs division of Standard Organics, manufacture of a wide range of products for domestic and export markets along with sale of these products is expected to improve. The exports division is focusing on establishing new markets along with the introduction of new products. With formulations becoming a thrust area, exports are expected to increase.

Standard Organics (SOL) was amalgamated with the company. During the year the company made a rights issue, followed by a public issue. The proceeds were utilised for meeting the cost of expansion and product diversification and working capital requirement. The company also made a 1:4 bonus issue in January 1994.

The company spent Rs 91 lakh on R and D in the year, developing formulations for export and also new cost effective processes.

SAYAJI INDUSTRIES

Higher Margins

After being plagued by rise in input cost and recession in the starch industry in the previous year leading to a fall in profit, Sayaji Industries has done well in 1993-94 with net sales increasing by 16 per cent, operating profit by 39 per cent and net profit by 106 per cent. Though there was a 100 per cent increase in taxation the effect was slightly reduced by a 46 per cent decrease in depreciation. Non-operating profits were down by 98 per cent. Other income went up by 10 per cent. Reduction in the cost of raw materials resulted in better production activity for the year. Also, the reduced bank rate enabled the company to borrow more at the same cost. But certain unfavourable factors like increase in the cost of electricity, coal and furnace oil and also increase in repairs and maintenance charges proved detrimental to raising the margins. The company declared a dividend of 75 per cent for the year against 50 per cent for the previous year. Earning per share has been high at Rs 471 in 1993-94 compared to Rs 226 in 1991-92 and Rs 213 in 1992-93. Remuneration to employees fell marginally by 4 percentage points in the year against 49 per cent in 1992-93. Both sales to total assets and sales to gross fixed assets ratios have risen steadily in the past three years. Short-term bank borrowings increased by 16 percentage points in 1992-93 but declined by 9 percentage points in 1993-94. Sundry creditors to current assets ratio fluctuated at 21 per cent in 1991-92, 27 per cent in 1992-93 and 22 per cent in 1993-94. Debt-equity ratio fluctuated at 15 per cent in 1991-92, 14 per cent in 1992-93 and 19 per cent in 1993-94.

Exports were up by 116 per cent while imports were up by 22 per cent. Increase in exports is being attributed to the agreements with Amylum of Belgium for the upgradation of technology. Installation of certain machineries and equipment has improved quality of finished products and reduced cost of production. The company has completed the establishment of its plant to manufacture 'Mannitol', used in foods, pharmaceutical and cosmetic products as an antioxidant, and commercial production is said to have commenced.

The company incurred an expenditure of Rs 15 lakh for its R and D activities. The major thrust is being laid on pollution control and energy conservation.

HINDUSTAN SANITARYWARE

Modernisation Programme

Hindustan Sanitaryware, the flagship of the H L Somany Group is engaged in the manufacture of ceramic tiles and sanitaryware. The sanitaryware division has two units, one in Bahadurgarh in Haryana and the other in Somanyapuram in Andhra Pradesh. Net sales in 1993-94 were 16,851 mt

(up by Rs 9.95 crore in value), operating profit was up by 44 per cent (Rs 2.4 crore), and net profit by 40 per cent (Rs 1.65 crore). Depreciation and interest charges were down by 7 per cent and 8 per cent, respectively. The 10 per cent decrease in other income was more than compensated by the 18 per cent increase in non-operating profit. The company has maintained its dividend at 20 per cent for the year. Earning per share declined to Rs 16 for the year against Rs 21 in the previous year. Sundry creditors to current assets ratio declined from 18 per cent in 1991-92 to 16 per cent in 1992-93 and 11 per cent in 1993-94. Net profit margin more than doubled from 3 per cent in 1991-92 to 7 per cent in 1992-93, and then increased marginally by 1 percentage point in 1993-94. Debt-equity ratio fluctuated at 148 per cent in 1991-92, 21 per cent in 1992-93 and 35 per cent in 1993-94. Short-term bank borrowings to inventories ratio decreased by 10 percentage points in 1992-93 but has increased by 14 percentage points in 1993-94. Gross savings

to gross capital formation ratio increased by 50 percentage points in 1992-93 and by 188 percentage points in 1993-94. Net value added to value of production has remained stable at 39 per cent.

The Indian Council of Ceramic Tiles and Sanitaryware has been making persistent efforts for the reduction of excise duty to 20 per cent from 30 per cent. As a part of its modernisation programme, in one of the casting shops at Unit I, environment control equipment has been installed and successfully commissioned. This has resulted in increased productivity from the existing set-up. Many new patterns were developed for the export market and repeat orders have been coming in. The company expects to launch two new suites and is also planning the introduction of four new colours. Products of the company were well accepted in the UK market and the company has bagged its maiden export orders from the US market to become the first Indian sanitaryware company to enter the sophisticated US sanitaryware market.

LATEST IN SOCIOLOGY

SOCIAL STRATIFICATION & MOBILITY

K.L. Sharma

Professor Sharma examines critically theoretical and methodological issues in the essays included in this volume. The book provides a comprehensive and critical review of the studies on social stratification particularly from a sociology of knowledge perspective. The book must prove as a source material for teachers, researchers and students. It encompasses all that which one would normally like to know about social stratification in India.

Politics of Muslim Vote Bank

Irfan Engineer

A survey of Muslims in Bombay brings out the strong anti-Congress sentiment prevailing in the community. Irrespective of the Ulema council's directive, a majority of the Muslims are for an alliance with the backwards.

THE post-Babri masjid demolition and the consequent communal holocaust all over the country has rudely shocked the Muslim psyche. The anger of the community was seen recently in the assembly elections held in Karnataka and Andhra Pradesh, where Muslims are said to have voted against the Congress and thus, contributed to its defeat. Now elections are to be held in Maharashtra, Gujarat, Bihar, Orissa, and Arunachal Pradesh. Various political parties are vying for Muslim votes by offering various promises. In this context, the Centre for Study of Society and Secularism and IDRAAK conducted a survey to study the political perceptions of the minority community. A hundred-odd randomly picked up Muslim men and women in Bombay were respondents of this pre-poll survey. The survey was done more than a month before the poll date, the campaigning had not yet commenced and the candidates were yet to be finalised by the parties. However, the intention was more to gauge the preferences for political parties and programmes rather than for individual candidates.

The Muslims constitute about 15 per cent of the city's population. They are concentrated in few pockets in the city and therefore capable of influencing election results in at least 11 out of the 34 metropolitan constituencies. Their presence in other constituencies is marginal and incapable of influencing the election results. City Muslims do not constitute a monolithic community though the Hindutva forces, the Muslim fundamentalists and other parliamentary parties would like the common man to believe so. Muslims in the city come from various regions of the country and continue to maintain their regional identities. Similarly, they are also divided into different sects, with each sect having its own priesthood which ensures that the Muslims remain divided along sectarian lines. Nearly 95 per cent of the city Muslims live in dire poverty, toiling as petty vendors, bakery workers, daily wage earners in shops and small firms owned by Muslims. Some Muslims are engaged as low wage earning artisans in wood carving and zari designing. The much discussed Bangladeshi Muslims work as

bonded labourers in the construction industry. The remaining 5 per cent own shops, business, small-scale factories, financial institutions like the Bombay Mercantile Co-operative Bank, with a very few in salaried jobs. They are mostly composed of business communities like bohras, khojas and memons. Thus, the Muslim elites of the city mostly belong to the business class.

MUSLIM COMMUNITIES

Muslims are divided into numerous sects such as wahabis, deobandis, ahle-hadis, bohras, khojas, memons, etc. Each sect claims itself to be more loyal adherent than the others. Muslims are also divided on regional, class and caste lines, e.g. sheikhs, ansaris, qureshis, pathans, syeds, bagwans, and so on. Sociologically, there is hardly any commonality between these communities, except that they are all followers of Islam. These communities rarely mix with each other and zealously guard their own identities. Each sect maintains a separate mosque. The syeds, the sheikhs and the pathans consider themselves superior and hold the lower caste converts like qureshis and ansaris in contempt. The upper caste converts to Islam, like the bohras and the khojas, have strong prejudices against other Muslims whom they address as 'mabhai'. The bohras and the khojas intermingle more with upper caste

Hindus than lower caste Muslim converts.

These separate communal identities persisted due to the varied customs and rituals followed by the communities, reflecting their regional, caste and economic differentiation. Each Islamic sect has its own clergy and elite who have vested interest in keeping the followers divided on the basis of petty sectarian issues. Thus, even the political participation of the members is decided at the sect/community level. The elites of each sect/community, in order to protect and further their economic interests, extend financial support and assist the politically ambitious members in the elections. In return they expect political patronage from them. The clergy also wants congenial environment to operate. The clergy and the elite thus join hands and appeal to the members to vote for the party which can best assure them of patronage. The economic elite wield influence over their community since they support all charitable purposes like educational institutions, health services, mosques, and also, to some extent, the well-being of the poor. Nevertheless, whenever there were compelling reasons, the deprived sections of the community have ignored the advice of their elites and clergy. There are two glaring instances of this in the post-Babri masjid demolition period. (i) all Muslims, cutting across class, caste and sect, refused to obey Imam Bukhari's call in 1993 to hoist black flags and boycott the Republic Day in order to protest against the demolition of Babri masjid; (ii) the Muslims ignored the Imam's appeal to vote for Janata Dal in the recent assembly elections of UP. The Muslim masses wisely voted for SP-BSP candidates where the latter were likely to win and voted for that candidate who would defeat the BJP where SP-BSP alliance was unlikely to win.

The political participation of the bohras can be studied as an instance of the sect/

TABLE 1. PERFORMANCE OF MUSLIM CANDIDATES IN ASSEMBLY ELECTIONS

Constituency	1980		1985		1990

* the candidate was victorious.

community level participation of the Muslims in the election process. The religious head of the bohras, the Syedna, always asks his community members to vote for the Congress candidates. Before issuing such directive, he bargains with the party and protects his interests. The Syedna is least bothered about the Shahi Imam's directive to vote for a party of the latter's choice. Similarly, the Shahi Imam's writ does not run over other sects. The elites and the clergies of different communities enter into separate bargains with political parties of their choice to protect their vested interests. Muslim leaders belonging to same political party vie with each other. The Muslims vote unitedly only when they perceive a common threat. The Ulema council has been recently constituted in the city. It is an attempt to bring together the clergy of various sects so that they can cohesively intervene in certain situations. The Ulema council, dominated by the sunnis, has dissensions within it. The political parties have thus pacified the clergy and allowed fundamentalism to grow. But overwhelming majority of the Muslims, who are deprived, often vote against the wishes of the clergy and the elite of their sect.

The clerical-elitist appeal is one of the factors that influences the voting pattern of the Muslims. The Urdu press, too, has tremendous influence on the Muslim voting behaviour. In general, the Urdu press survives by stoking the passions of the Muslim community. *Inquilab* which gives high dose of fundamentalism, has highest circulation. Being more fundamentalist has never prevented it from being pro-Congress. Only recently, after Fuzail Jafri became the editor, that *Inquilab* has become critical of the Congress. It is giving extensive coverage to the Ulema council and trying to convey an impression that all Muslims are eagerly awaiting the directive of the council to make their decision. However, as prominent Muslims admit, the Ulema council's decision would hardly influence 5 per cent of the Muslims. Due to internal dissensions, the Ulema council has not been able to decide. The orthodox sunni section has already severed its links with the council. When contacted, the general secretary of the council, Maulana Abdus Qudus Kashmiri refused to say anything about the elections, except that the Muslims should not vote for the Congress or the BJP. *Inquilab* is also reporting the various meetings of the Ulema which criticise the Muslim leaders for lack of unity within them. The Muslim leaders in turn allege that the Ulema itself is not united. The reality is that neither the leaders nor the clergy want to unite so as to safeguard the interest of the Muslims. Their interests differ widely and can be safeguarded only by supporting various forces. *Urdu Times*, on the other hand, is playing down the Ulema council. It gave extensive coverage to the recent visit

of Mulayam Singh Yadav and is backing the third force. Sarfraz Arzoo, the editor of *Hindustan* is campaigning amongst the Muslims to vote for the BJP-SS alliance. The editor is opportunistic. Nevertheless, *Hindustan* has very little circulation.

Various parties and organisations are holding public meetings in the Muslim-dominated areas and raking up different issues to influence the voters. Mulayam Singh held a public meeting on YMCA grounds which was reportedly well attended by the Muslims. He highlighted his government's achievements, including the recruitment of 9 per cent Muslims to the police force. He criticised TADA and emphasised the unity of the Muslims and the backward classes to fight against the communal forces. The meeting was organised by UP Haj and Welfare Association, Bombay Aman Committee, Bombay Citizens Welfare Committee and Agripada Relief Committee. Muslims lined up on both sides of the road from where his motorcade was to pass and many prominent Muslim citizens called on him. Bashir Patel, the lone Muslim League MLA who defected to Samajwadi Party along with three party corporators, mentioned in a press conference that he joined Samajwadi Party to work for the unity of the Muslims and the backward classes. Another public meeting was addressed by Ibrahim Suleiman Sait who leads Indian National League, the breakaway faction of Muslim League in Kerala. The target of his attack was G M Banatwala, the president of Muslim League. He charged Banatwala of being a Congress agent and called upon the Muslims to support the third force. Muslim Samaj Sangathan also organised a public meeting which was addressed by Ramdas Athavale, the minister of state for welfare. The minister and the organisers exhorted the Muslims to look beyond their own community and work for a unity with the backward classes so as to defeat the communal forces.

Like other communities, the Muslims also formed secular organisations to solve their day-to-day problems and organise welfare activities. While some organisations have general membership, some are exclusively Muslim organisations (especially when the Muslims do not have any say in multi-community organisations of a particular area). Like Ganeshotsav mandals, these organisations organise religio-cultural activities like Moharram, Tazia processions, etc. This is done in co-operation with other communities. The leaders of these organisations have to keep good relations with various party leaders in order to solve problems like civic malfunctioning, getting arrested people released, and securing funds for their activities. Depending on which party helps them, the leaders of these organisations ask people to vote for that party. By and large the decisions regarding

casting of votes are taken at this level. Our investigators found that most of the local leaders have gone against the Congress and that too for non-religious reasons. The local leaders were helpless spectators during the communal riots and after the bomb blasts even the innocents were harassed. They found entire state administration against them. Even the Muslim leaders of the Congress failed to do anything substantial for them. They are annoyed for being repeatedly called upon to prove their citizenship and patriotic credentials. No leader, whichever party he may belong to, is able at the present juncture to assure the community. Therefore, the community seems to be in a mood to defeat the Congress that has brought them to such a pass. In order to achieve this they have started to look for alliances with the non-Muslims. But since the third force has not materialised, it remains to be seen whom the Muslims will vote.

Scientific Communities and Brain Drain: A Sociological Study". Subodh Mahanti, VV Krishna, E Haribabu, Vinod Jairath, Aparna Basu. *Gyan Publishing House, New Delhi, 1994, Rs.200.00, pages 149.*

The migration of skilled scientific and technical personnel from India to affluent West is a sociological phenomenon with manifold dimensions. A number of studies estimate a loss of US\$10-20 billion to India due to Indian brain drain during 1966-86 alone. Do the brains go where money is or the brains go where the brains are? This exploratory study, inspired by late Professor Sukhomoy Chakraborty and undertaken by NISTADS, identifies and defines brain drain beyond its much discusses economic dimension.

It helps (a) understand the structure and organisation of Indian scientific community as reflected in the research groups, (b) identify the social feature of research groups which tend to check or promote the process of brain drain, and (c) suggest some policy recommendations on the basis of findings.

It provides fresh insight into the brain drain--an original contribution to the literature on the subject.

Orders may be placed with either the publisher or NISTADS

In the 1989 and 1991 Lok Sabha and 1990 assembly elections, Muslim voters in Bombay had preferred the Congress. The 1989 elections resulted in a hung parliament. Yet, the National Front had not struck roots in Bombay. Thus, for all practical purposes, the choice for Bombayites was between the Congress and the BJP (the BJP-SS alliance had not yet materialised). Both, the Congress as well as the Hindutva forces, were competing to capitalise on the Ram Janmabhoomi-Babri masjid controversy. Rajiv Gandhi had commenced his campaign from Ayodhya by laying the foundation stone of the Ram temple in November 1989. The Congress as well as the Hindutva forces were competing for Hindu votes, taking advantage of the phobia amongst the Hindus engendered by the separatist movements in the country. Muslim vote bank then had little significance. The same situation more or less continued during the 1990 assembly elections. The Congress had fielded four Muslim candidates in the city, out of which three won. The candidate who lost was Abdullah Shahadat from Umarchhadi constituency, who was defeated by the Muslim League candidate Bashir Patel by nearly 14,000 votes. Due to the rising tempo of Ram Janmabhoomi-Babri masjid issue, the Muslim League (ML) for the first time expanded its base in the 1990 elections. It not only won the Umarchhadi seat but also polled more votes than previous elections. In 1980, the ML could poll only 17,609 votes from the four constituencies. In 1985 assembly elections, it polled 56,643 votes from five constituencies and in 1990 it polled 1,01,085 votes from these five constituencies. The ML also stood second in Amboli assembly seat, which was won by Shiv Sena. A small section of the Muslims therefore appear to have expressed their displeasure with the soft Hindutva stand of the Congress during the 1990 assembly elections itself.

Table 2 shows that the Muslim voters slowly but steadily are shifting away from the Congress. The shift is significant. In fact, more Muslims are likely to vote against the Congress than the survey shows. This is evident from the fact that out of the 29 per cent who showed their preference for the Congress, 22 per cent did not approve of the Congress' policy on the Babri masjid dispute and the communal riots. It is also possible that the Muslims would vote for the Congress since the third force has not emerged in the state. The only area where those who will vote for the Congress outnumbered those who were for the third force, was Govandi and Baiganwadi where the Congress minister Javed Khan is to

contest. Javed Khan is known for his strong arm tactics and had reportedly arrested a Muslim woman who had publicly expressed her dissatisfaction with the developmental work in the area. A prominent social worker of the area and erstwhile Congress supporter, Sher Ali, has publicly said that he will not work for Javed Khan and the Congress.

Ten respondents showed their preference for the BJP. As many as eight out of them approved the BJP's policy towards the Muslims. However, all those who showed their preference for the third force approved of their policy towards the Muslims. Even those who did not want to vote or had not yet decided whom to vote, expressed their displeasure with the Congress. In all only 7 per cent approved of the Congress policy on the Babri masjid and the communal riots.

Salim Zakaria, the minister of state for education, who is contesting elections from Bandra agreed that the Muslims are unhappy with the Congress and that the BJP has succeeded in alienating the Muslims from the Congress. He was critical of the Congress for not taking firm steps to counter BJP's propaganda. The alienation, according to him, climaxed with the demolition of the Babri masjid and the construction of the unauthorised temple. The Congress, he felt, should have accepted its mistakes and assuaged Muslim sentiments. The Bombay riots worsened the situation. Punishing Bal Thackeray, Zakaria added, is not challenge to the Muslims but to the law of the land. Nevertheless, he opined that there is no alternative for the Muslims other than the Congress. The secular elements in the Congress should be strengthened and this can be done if the Muslims stand solidly behind the party. The disintegration of the Janata Dal and the third force has left no alternative for the Muslims but to stand behind the Congress.

TABLE 2: PARTYWISE VOTING PREFERENCE
(percentage)

Party	Voting Preference
Congress	29
BJP	10
Third Force	44
Will not vote	5
Not Decided	12

The survey shatters several misconceptions. One misconception is that the Muslims give top consideration to their religious interests while casting their vote. Though 22 per cent of the Muslims did not approve of the Congress policy towards the Babri masjid and the communal riots, they still wanted to vote for the Congress for other reasons. Amongst these are businessmen and professionals who in all probability approve of the economic policies of the Congress and may have benefited to some extent. This also indicates that there is polarisation within the community. The deprived section of the community would like to punish the Congress not only for lack of concern and discrimination against them, it also seems to be concerned with its security. The businessmen and the professionals, nevertheless, constitute a microscopic minority within the Muslim community. Therefore, the deprived masses who suffered during the riots and are concerned about their security, and are at the receiving end of the new economic policy are against the Congress.

The different party preferences also indicate that the Muslims do not vote unitedly. Only 12 respondents had not made up their mind whereas 88 respondents had decided whether to vote or not and whom to vote. This is significant because the Ulema council has not yet decided for whom should they direct the Muslims to vote. Thus, even before the Ulema council announces its directive, majority of the Muslims seem to have made up their mind.

MUSLIM VOTE BANK

Most political parties like to give an impression of a herd mentality amongst the Muslims. If previous voting patterns are any indication, the Muslims are neither exclusive vote bank of the Congress nor have they always voted unitedly. Vote banks are more a creation of political parties rather than religious or communal behaviour. Moreover, the Muslim community is not the only community to vote unitedly. Other communities also have at times voted unitedly. Political exigencies of the parties and economic interests of the elites result in projections of vote banks. Certain emotional issues like Muslim

TABLE 3: AREAWISE VOTING PREFERENCE

personal law are sometimes exploited successfully. Perception of common threat, nevertheless, does make the Muslims vote unitedly. More intense the threat, more unitedly the community acts and votes. In Rampur constituency (UP), there are 47 per cent Muslim voters. Yet, in 1991 BJP won because of the division of the Muslim votes amongst three parties. Same thing happened in Domariaganj (UP) constituency from where Mohsina Qidwai, a senior Congress leader, and Seema Mustafa, a BJP candidate were contesting. In spite of 35 per cent Muslim votes, their division led to BJP victory. In West Bengal, the Muslims always vote for the Left Front defeating even the Muslim candidates of the Congress

ANTI-CONGRESS VOTES

Though the Muslims voted for the Congress in the post-independence period, it was due to its popularity and secular image. They never hesitated to vote against the Congress whenever it became unpopular. The Samyukta Vidhayak Dal governments in West Bengal, UP, Bihar, Punjab could not have been formed without the support of the Muslim communities in 1967 when the Congress was voted out of power. Charan Singh successfully garnered the votes of Jats, OBCs and Muslims to become the chief minister of UP. In the years immediately preceding 1967, there were two factors (besides of course the general economic crisis) which influenced the Muslim vote. The major communal riot at Jabalpur in 1961 and the whipping up of national chauvinism during 1965 Indo-Pak war guided the Muslim votes. The Shahi Imam stood up against the demolition of the Muslim-dominated slums during the emergency. The government's inability to arrest him made him popular amongst the Delhi Muslims. When the emergency was lifted, Vajpayee and the Imam addressed several Muslim gatherings and appealed them to vote for the Janata Party. Impression was thus formed that he is the leader of all Muslims. If the Muslims voted against the Congress in 1977 elections, it was because the Shahi Imam was accepted by all Muslims as their leader for his opposition to the emergency.

Indira Gandhi tried to woo back the Muslim votes in 1980 elections by hobnobbing with the Shahi Imam. However, in spite of the Imam's directive, the Congress could not get massive Muslim votes. A section of the Muslims did vote for the Congress since the Janata Party had split. Subsequently, Indira Gandhi lost confidence in Muslim votes. The common threat of insecurity amongst the Hindus due to the secessionist movements in Punjab and Assam were used to carve out a Hindu

vote bank. Minority vote bank could be thus dispensed with.

The dominant political forces are now divided into three camps, the Congress, the BJP and the NF-LF. The importance of the Muslim vote bank has thus increased. More so, since the Muslims are at present insecure due to the onslaught of the Sangh parivar's Hindutva, the soft Hindutva of the Congress, the trauma of communal riots and the increasing atrocities under TADA. They are therefore likely to vote unitedly to defeat the Congress as well as the BJP-Shiv Sena combine. This, however, should not give rise to the misconception of permanent vote bank of the Muslims since the Muslims are as divided as the Hindus on caste, regional and sectarian lines.

The real issues of the deprived Muslims have so far been ignored by the fundamentalist-dominated leadership. Political parties in their lust for votes have assisted the fundamentalist section. This has led to the suppression of democratic forces within the community. A new hope is however on the horizon. After the demolition of the Babri masjid, polarisation is taking place within the community between the fundamentalist and the democratic forces. In order to defeat the

Congress the deprived sections want to join hands with the backward classes. Recently, there have been several Muslim OBC conventions in Maharashtra wherein cutting across community lines, the deprived Muslims have resolved to unite for their just demands. This will unsettle the fundamentalists and interests of the deprived sections will be on the agenda. For this trend to succeed, genuine democratic forces cutting across religious barriers should come together. Gauging this trend, Sharad Pawar has promptly announced the government's resolve to extend reservations to the Muslim OBCs.

Salim Zakaria wants the secular forces within the Congress to be strengthening. With this propaganda, 50 per cent of the Muslim votes will be in favour of the Congress and other 50 per cent will be divided between remaining parties. However, the deprived Muslims are so angry that they are likely to vote against the Congress and the BJP. But whom they will vote depends on the candidates of non-Congress, non-BJP parties. We have already witnessed such voting pattern in the last UP elections.

[The survey of Muslim voters was carried out on behalf of Centre for Study of Society and Secularism.]

Eighth World Tamil Conference Of Cardboard History and Discursive Space

V Geetha
S V Rajadurai

With the divine blessings of Jayalalitha, the Eighth World Tamil Conference in Thanjavur concluded successfully, showering praise on its patroness. The distinguished participants demonstrated their scholarly disengagement from the world of realpolitik by maintaining a cautious silence about the deportation of their colleagues.

THE presiding deities of the eighth World Tamil Conference which concluded in Thanjavur on January 5, 1995 constituted a veritable Holy Trinity in themselves. Summoned to bless this hallowed event by AIADMK partymen and women, the medieval Chola monarch Rajaraja I, Thiruvalluvar whose verses edify the minds of bus commuters in Tamil Nadu everyday (inscribed as they are inside buses that tiredly ply the anarchic roads of Tamil country), and M G Ramachandran, Tamil Nadu's hero for all seasons, arrived in their respective avatars of stone and bronze to grace mouldy old Thanjavur. The choice of this particular trinity is, of course, not entirely fortuitous. Chief minister Jayalalitha's pretensions to authority derive from a patchwork tradition, and Rajaraja, who consecrated brahmin hegemony at the altar of royal rule, is a natural forebear. For one who thrives on a complete lack of accountability to the political process and the people, and whose chief virtue is her immense capacity to relish sycophancy in all its diverse forms, the murky politics of medievalism is bound to hold attractions. Thiruvalluvar, whose ethical wisdom is often invoked to represent quintessential Tamilness, is a useful household god. For one who reveres the Kanchi Paramacharya and Periyar ostensibly in equal measure, Thiruvalluvar assumes great significance. Constituted as he is in popular imagination as one who is always beyond caste and community, he reconciles contrary qualities in himself. Thus he represents rational, ethical as well as spiritual and sacred attributes and stands for a civilisational glory to which all Tamils may aspire. M G Ramachandran is a divinity of a different calibre. He is part guardian spirit and part transcendent object. He exists as a touchstone on which subsequent leaders are expected to test their munificence, nobility and good intent. His very name invokes reverence and more important, lends credence to Jayalalitha's careless promises of largesse to the people.

In their lack of fit with one another, this unlikely trinity may be seen to be emblematic of history as it obtains in present day Tamil Nadu. Never has the Tamil past appeared so tawdry and inauthentic as it does now –

claimed by a party and a leader who have done and said nothing to thus effortlessly appropriate it. Unlike her forebears in office – here one must reluctantly include MGR – Jayalalitha has no affiliation to speak of with the Non-Brahmin-Dravidian movement. Her attempts to own history and embody it in her person are symptomatic of her essential non-relation to this history. She lacks that power of utterance which came so easily to C N Annadurai and M Karunanidhi, both of whom utilised the word to constitute a viable community and polity. Neither can Jayalalitha hope to capture and possess that aura which still surrounds MGR. She had to, therefore, necessarily resort to cardboard and tinsel to invent a past, create a present and carve out a constituency. It is not accidental that at Thanjavur she forced history to confront its own past achievements in stone and metal with creations in cardboard and synthetic paint. Arches (one of them compared her with the Vaishnavite saint Andal), cut-outs, posters, floats and billboards were assembled in all their tinsel glory to announce the triumph of the kitsch version of Tamil history. Jayalalitha and her ministers were present at that blessed hour when history marched past in a haze of silverfoil and technicolour. Her benign gaze and approval imparted to this roll-call of the dead and buried a certain 'truth'. During the conference this sanctified truth would hover over seminar halls, mocking the vainglory of scholars who had gathered in vast numbers to argue, deliberate and establish their fine points of view.

* * *

Questions of history, historical truth and objectivity were resolved in the most historical fashion at the Eighth World Tamil Conference. That spirit of enquiry and curiosity which seeks to make sense of the past, and that eschatological urge to connect and narrate events and scholars' will to knowledge, were put to test, as a host of persons, including the prime minister P V Narasimha Rao, sought tirelessly to reiterate well-worn myths about the glory that was Tamil culture. In a speech that could easily rival a 10th standard school history textbook's claims to erudition and

knowledge, Narasimha Rao, famed for his learning and his talents as a polyglot, demonstrated once more that singular lack of vivacity and wit which have endeared him to wags and cartoonists all over the country. Names of ancient Tamil classics and poets tumbled out of his talk in a hurry and in pell-mell fashion as his practised literary tongue clicked in frustration over those oh so harsh Tamil syllables! It is possible he considered this ordeal worth suffering in order to strike a fresh deal with Jayalalitha's AIADMK and evolve a New Electoral Policy that ignores irritants like the TNCC chief's protest against Rao's participation in the conference.

Lapses of a more serious sort occurred as well, but we can vouch that neither the prime minister nor the central government had anything to do with these. Consider the logo designed for the conference – it shows a map of the world across which are strewn sundry objects ostensibly symbolic of Tamil history and culture. Our concern is with the map as such, since it is a curious one that has neatly excised out the island of Sri Lanka from its contents! It is as if the organisers not only desired to re-write history in Her image – as one long-standing billboard in Madras city has it, 'henceforth there will be no history only Her-story' – but were determined to re-draw the map of the world if only to gratify her geographical imagination. Thus a new sacred geography has been propounded in defiance of actually existing lines of political and cultural demarcation and intersection. Sri Lanka and its Tamil population obviously cannot figure in this cultural universe where historical and linguistic links and shared cultural worlds and concerns have been erased in favour of a bounded and 'pure' cultural space. Here, surrounded by lifeless symbols of culture she covets – the cultural objects shown in the logo include images of the flags of the Chola, Pandya and Chera kingdoms and a temple tower – Jayalalitha reigns supreme, proud and alone in her unabashed narcissism.

It is another matter that the Tamil diaspora whose history and culture the conference is supposed to represent consists largely of Tamils from Sri Lanka whose contributions to Tamil research and study have been extremely significant. (One may recall the singular contribution of late Father Xavier Thaninayakam whose brain-child is the International Association of Tamil Research (IATR), which is nominally responsible for organising World Tamil Conferences.) When the sovereign wills, the subjects have to make themselves invisible. Or, as happened with Sivathamby, Rupavathi Sivathamby, Velup Pillai, Shanmugadoss, Manonmani Shanmugadoss and Peter Schalk, they are simply whisked away by the police.

* * *

The forced and dramatic deportation of these renowned scholars from the conference

and subsequently from India is a matter that begs explanation. To date, none has been offered. Sivathamby, who is past 65 years of age, has pioneered critical work on ancient Tamil drama. His work on Tamil literary history, historiography, Saiva Siddhanta philosophy, film, and modern literature in Tamil reveal him to be a scholar of many talents whose range of enquiry is wide and whose observations have always been stimulating. Sivathamby earned his doctorate from the University of Birmingham and was a student of Georg Thomson, well known, Marxist teacher and critic. In spite of his ill health, Sivathamby continues to live in Jaffna despite black-outs, gunfire, rations and the LTTE. Velup Pillai, a Jaffna Tamil now teaching in Uppasala University in Sweden, is chiefly known for his excellent studies in Tamil literature of the Sangam period and the philosophy of the ancient Tamils. Shanmugadoss heads the department of Tamil in Jaffna University and has produced outstanding works on Tamil grammar. His wife Manonmani Shanmugadoss is a scholar of her own repute and is working in a prestigious institute of Colombo. Rupavathi Sivathamby, wife of Sivathamby, is a meritorious academic. The Swedish scholar Peter Schalk has been a keen observer and student of Tamil history and culture, and his paper on, "The First Evidence for the beginning of Buddhism in Tamil Country" was approved by the IATR for presentation in one of the seminars of the conference. He has, at times, lent his name to the cause of human rights of Tamils in Sri Lanka, and this has earned him the unique distinction of receiving two deportation orders – the first from the Sri Lankan government a few years ago while he was on tour in the island, and now from a state government in India that rules in the name of the Tamils. But by no stretch of the imagination could the words or deeds of these scholars be interpreted to be in sympathy even remotely with the ideology and practice of the LTTE. If none of the scholars still based in Jaffna has chosen to speak a word against the Tigers, it is because of their commitment to discretion as the better part of (their) valour.

The humiliation suffered by the scholars did not stop with their graceless expulsion from the conference. Sivathamby and Velup Pillai, together with their family members, were virtually kept under house arrest in the Madras University Guest House with the 'Q' branch police keeping the surveillance. It is obvious that none of these men and women nor the other 25 or so Sri Lankan Tamil scholars could have constituted a threat to the security of the chief minister Jayalalitha or, for that matter, the nation. If this were not a matter of grave importance, the solemn observation of officials that they had received "adverse notice" regarding these scholars could be construed to represent a laughable instance of paranoia. It is clear that the

objection to these scholars is due solely to their filiatory and, in a sense, entirely accidental ties to Sri Lanka. To penalise them for living and working in an existential context they cannot wish away is, of course, to penalise birth. As such the gross injustice done to these men and women can only be described as undiluted political racism. The chief secretary to the government of Tamil Nadu has tried to shift responsibility and blame by claiming the visas given to the deported men and women had been cancelled by the central government at the last moment. He cannot, however, explain how the Indian high commissioner's office in Colombo issued visas and the immigration officials in Madras city cleared their entry into the country in the first place. Besides, lists of invitees had been prepared in advance by the IATR and approved by the Tamil Nadu government, which had ample time to make its apprehensions known. The state government has also tried to rationalise its actions by claiming that Sivathamby et al were invitees of the IATR and that it really had no idea who the scholarly invitees would be. This claim, coming as it is from a state government that has completely hijacked the conference, broke the silence of Nabora Karashima, the president of IATR who characterised it as 'strange logic'. It is noteworthy that the central government has neither agreed nor disagreed with the contention of the chief secretary to the Tamil Nadu government that it had ordered or implied that these particular scholars had to be expelled and deported. However, immigration officials are known to have remarked that their job is only to verify the genuineness of the passport and the validity of the visa, whereas the state government could order deportation of foreigners if it

so wished by filing an affidavit before a magistrate stating that the presence of the foreigner on Tamil soil is undesirable (*The Hindu*, Madras edition, January 4, 1995). It is clear that government of Tamil Nadu is solely to be blamed for this act of discourtesy and its arbitrary exercise of power.

The Tamil Nadu government's antipathy towards Sri Lanka has extended to Sinhalese as well, for Sinhala scholars too were left out from the list of invitees. Even those Sri Lankan Tamil scholars who were given preliminary invitations did not receive the final and officially confirmed invitations to the conference. There was no consultation, from the very beginning, with the Sri Lankan chapter of IATR. Meanwhile many of those who received the preliminary invitation had sent in abstracts of their articles and even paid the required participation fee of Rs 850. When the final invitations failed to arrive some of them sought the good offices of Sri Lankan minister Thondaman, who put to use his connections in Madras and obtained seven invitations. These invitations were shared between scholars from Jaffna University, Peredjiniya University and the Eastern University where Tamil and allied subjects are taught. But these seven did not know that their travels had just begun. When they reached Thanjavur they were dismayed to discover that Rajaram, the organising secretary of the conference, would not accept the invitations they possessed as valid. They were rudely asked to seek out Thondaman himself for further help. After a harried two days, during which they literally went without food and had to stay with friends, they decided to return to Madras. By then they had also come to know of Sivathamby's expulsion and naturally enough feared for their own safety.

SUSTAINABLE GROWTH OF AGRICULTURE IN INDIA

By
S K Mishra

The book shows that the instant need to feed the teeming millions has propelled us to increase the use of chemical fertilizers and adopt better agricultural practices which have created multifaceted problems in agriculture. The prices of inputs have increased at a much faster rate than those of agricultural output. The author has stressed the use of self-produced organic manures from inorganic fertilizers:

Such a total lack of civility on the part of the government of Tamil Nadu was evident in other instances as well. No one is very clear as to whether Chenna Reddy, the governor of Tamil Nadu, was sent an official invitation to attend the conference. According to Raj Bhavan sources, an invitation mailed to him reached his office just two days before the conference. Former chief minister and DMK chief M Karunanidhi was sent an invitation which addressed him as an "ex-MLA". (He quipped back with the reply that this was a case of an ex-actress writing to an ex-MLA!). S R Balasubramaniam, the leader of the opposition Congress(I) in the Tamil Nadu legislative assembly, fared worse. An invitation handed over to him by a traffic police inspector did not even address him by name but only as "Leader of Opposition". Not only do these acts constitute a breach of propriety but they express a political arrogance that has shown itself to be utterly indifferent to criticism, imprecations and rebukes. The Thanjavur conference will be remembered as much for the habitual practice of a diabolical doublespeak by the AIADMK as for the ineptitude and lack of professional decorum which characterised it.

* * *

As Jayalalitha was making history (and headlines) of a sort, the seminars attended by scholars (both local and foreign) in the various disciplines progressed in due solemnity. Paper readers and observers expressed their "utmost satisfaction" at the conduct of academic sessions and were one in noting that whatever disturbances had occurred outside their exalted premises, these did not affect the nature and content of their deliberations. The matter of the deportations elicited a protest from Karashima well after it had occurred. Others waited out their turn and chose to make their displeasure known only during the concluding plenary session. By that time Sivathamby was already in Jaffna and Velup Pillai was making a detour to Stockholm. Neither these protests nor the statements of men such as Burton Stein – he is reported to have characterised the deportations as a fascist gesture – mattered at that point; except that they served as pathetic instances of a scholarly conscience reluctantly and lately come to life. For the few who protested there were many who maintained a cautious silence which they dared break only after the conference was over. Robert Frykenberg, for instance, in an interview given to an English daily observed: "When the bone of contention between two countries and two communities is Tamil, and when one country's prime minister has been blown up because of this, there is no point in commenting because no matter how you look at it, it is an extremely sensitive issue" (*Indian Express*, Madras edition, January 8, 1995). Prime minister Rao could not have produced a more evasive answer

nor dared to implicate the deported scholars in the Rajiv murder case! This scholarly disengagement with the world of *realpolitik* is not only disturbing but extremely problematic as well. Does Frykenberg suggest that the expulsions were somewhat justified? Does he imply that when politics and statesmen are involved in a matter such as this, academics and intellectuals would do well to remain silent and willingly abdicate their ethical responsibilities? For us who are beyond the pale of academia this is simply an instance of scholars preferring concourse with the dead than a dialogic engagement with the living. Not that these are such mutually exclusive tasks that they may, thus, be separated even for heuristic/hermeneutic or analytic purposes.

* * *

This brings us to the vexed question of the relationships that underwrite the history-politics equation, or more generally the relationship that exists between intellectual enquiry and political responsibility. There are several issues that need to be disentangled here: First, if intellectual enquiry, especially as it relates to history, is to freeze up within its own discursive space, it automatically becomes sealed off from a larger communicative universe. Here, other versions of the past get written and often at a ruler's whim. Lies, half-truths, patent falsehoods and deceptions are habitually yoked together to produce a formidable narrative that reproduces itself with little or no effort because a solid and powerful communicative apparatus literally realises these fictions as saleable truth. If intellectuals fail to, or refuse to, engage these lies in a combative sense, they risk becoming collusive with the perpetrators of these falsehoods. For a generation that has only known MGR and Jayalalitha, all of modern non-brahmin politics converge into a much awaited telos where, as we remarked earlier, history becomes her-story – in what really amounts to a double travesty of the non-brahmin movement and feminist discourse. If academicians are going to let this sort of a travesty take place on the grounds that this is all politics, while we are doing the real questioning and the real thing, one is forced to question the credibility and motivations of such exercises in academic learning.

Second, the IATR obviously cannot seek refuge in a sort of schizoid reasoning – let the government go ahead with its own show while we men of letters confer in peace. For what this really amounts to is that two sorts of knowledge are being sanctioned here, one for the adoring masses who anyway do not care for history, and one for the insiders who really cannot be expected to worry about the adoring masses. The question then is, what are these conferences for and for whose benefit is research being urged in diverse fields? Allowing for the interplay between knowledge and power that is characteristic

of a great deal of intellectual enquiry, one is still left with the question of scholarly responsibility, of whether it is merely to archive or whether it can be extended to the hapless living as well?

* * *

Last: we cannot really close our observations without offering a few examples of that diabolical doublespeak we had occasion to refer to elsewhere. The first instance relates to a session on women in Tamil Nadu that was graced by the chief minister herself. The recurring theme of the various addresses was simply this: that under Jayalalitha's compassionate rule, women's lot has improved vastly, that she was indeed personally responsible for this glorious achievement. Jayalalitha was duly apostrophised by almost every speaker, many of whom prostrated themselves before her before commencing their talk. What seems galling about this particular session is its essential falsehood. For in the three years since Jayalalitha assumed office, not only have monumental crimes against women been reported, a considerable number of them involving the police, but the one act for which she is often praised – the setting up of women's police stations – has proved as much of a nuisance as anything else. For one thing, women constables have proved themselves to be as harshly abusive of women petitioners as their male counterparts, and occasionally as foul-mouthed as well. Further, given the excessive pampering of the police force by the chief minister, the police have become a virtual law unto themselves, unaccountable to even the judiciary. More important for our purposes, they have set themselves up as moral arbiters in family disputes and are known to have coerced women to go back to unhappy marriages. This being the reality experienced by thousands of women, it is surely gross that Jayalalitha and her worshippers should thus comfort each other with self-serving lies and fortify themselves within a circle of deception.

However, doublespeak is not confined to Jayalalitha's political camp alone. Consider P Nedumaran, vociferous supporter of the LTTE and advocate of self-determination for Tamil Nadu – not only was he present at the conference while scores of Tamil scholars and enthusiasts (some of them led by his political allies) were lathi-charged and bundled out of Thanjavur to be thrown into the central prison in Trichy for trying to organise a demonstration to protest against the state government's unwillingness to make Tamil the sole medium of education and administration at all levels, but he even attempted to defend Jayalalitha on the matter of deportation of scholars by arguing that the centre was to blame. It is clear that in the tinsel world of Tamil Nadu's politics, colours may be changed at will to keep intact the glitter that characterises it.

'No Fish to Eat'

Impact of Liberalisation

Ambrose Pinto
Berin Loekas
Latha Radhakrishnan

In spite of the now well known effects of mechanised boats on fish catch as well as on the economy of the traditional fishing community, the government of India has now opened Indian waters to foreign fishing vessels. Protesting against this invasion which will have a disastrous impact on the economy and the social life of fisherfolk, are both traditional fisherfolk as well as mechanised boat operators.

FISHING in the territorial waters and beyond has always been the major source of livelihood for fishermen all along the coast. Till the early 70s fishing was confined to traditional type of vessels, viz, catamarans, country craft and canoes. When the mechanised vessels with fishing gear and bottom trawling were introduced conflict arose between the traditional fishermen and the new class of mechanised boat operators. The introduction of mechanised boats no doubt enhanced the marine fish production. But they also brought forth a number of socio-economic problems. The mechanised boats scrapped the bottom of the sea for fish. This led to the gradual decrease in fish haul and made life difficult to traditional fishermen. Bottom-trawling during monsoon months adversely affected the growth and viability of fish, in particular the spawning of fish.

Kerala's traditional fishermen who were the most organised raised a cry and hue against the mechanised boats. The government of Kerala appointed in the year 1981 an expert committee headed by D Babu Paul to enquire into the allegations of traditional fisherfolk. The committee with its vested interest members could not reach unanimity on the question. Later the government appointed the Kalawar Commission and based on the report prohibited bottom-trawling during the monsoon period. In the interest of conservation of fish wealth the Kerala government, from 1992, banned bottom-trawling by all the boats in the territorial waters. As expected the lobby of the mechanised boats appealed to the court. The Kerala High Court supported the findings of Kalawar Committee and two reports of the special officers appointed by the state government and observed that "mechanised nets like the purse-seine do an irreparable damage to the existing stock of fish by killing the juvenile fish and fish eggs and by preventing fish breeding". The purse-seiner caught 600-800 tonnes of fish per annum while the traditional crafts could catch only five tonnes in 1980-82 in Kerala. The situation of the traditional crafts is

worse today on account of non-availability of fish.

The court also observed from the data provided that while the population of the traditional fishermen has increased by more than 20.8 per cent, the average production of each fisherman declined by more than half. This resulted in 98.5 per cent of the fishermen population descending below the poverty line. The mechanised fish gear operators though smaller in number were able to catch more than 92 per cent of the fish. This left a fatal effect upon the lives and economy of the traditional fishermen. The court had no hesitation in stating in clear terms that the use of mechanised gear in fishing did not lead to any increase in production. But it posed a real threat of depletion of stocks. In countries like the US, Norway, UK and Japan where the number of fishermen engaged in fishing is small, steps have been taken to restrict fishing by sophisticated gears to avoid destruction and depletion of the pelagic fish wealth.

In spite of the evil effects of mechanised boats on traditional fisherfolk, the government of India has now decided to open Indian waters to foreign vessels keeping with its policy of globalisation and liberalisation. The invasion of our seas by foreign fishing vessels has brought together both the traditional fisherfolk and the mechanised boat-operators. Use of destructive and uncontrolled fishing technologies of the west will quicken the pace of the depletion of fishery resources. According to the 'Food and Agricultural Organisations' already stocks in four out of the world's 17 major fisheries are seriously depleted while catches in nine other countries are declining. It is ironical that when some countries are waking up to the consequences of overfishing, India is welcoming foreign fishing vessels with open arms.

India has a huge coastline of about 6,100 km and an estimated annual potential of about four million tonnes. Fishery and allied activities is a source of livelihood for over 75 lakh people. The traditional fisherfolk

who constitute 80 per cent of the fishermen operate in the inshore waters within the 50m depth. Since fishing has become uneconomic, the small-scale fisherfolk are compelled to increase their investments 20-fold requiring even up to Rs 10 lakh to remain operational at present. With foreign vessels entering the race, traditional fisherfolk will have to be eased out of their age-old profession and thus deprived of their livelihood.

Leading industrial houses like ITC, Dunlop, Hindustan Lever, United Breweries, etc, have made big investments in shrimp culture, deep sea fishing and seafood processing projects. A large number of these projects are export-oriented. In addition to these large industrial houses, reputed companies from France, US, Japan, South Korea, Australia and Germany have come forward to establish joint ventures. The government's decision to permit joint ventures with 60 per cent equity within India's 200 km exclusive economic zone has led to restlessness among the country's fishing population. The 33 lakh fisherfolk who live along India's 9,040 km long coast are wondering about their bleak future.

In spite of all the scientific reports that point out to the depletion of our sea sources the technical committee instituted by the government of India has recommended an increase in deep sea fishing under the assumption that there are fish stocks for 2,630 deep sea vessels. About 128 licences have been issued till February 1994. What is worse is that foreign vessels have been given the right to export 100 per cent of their catches for a mere 12 per cent remittance of the earnings. These licences permit the vessels to haul in everything with their over efficient nets. Licence grant the right to fish without any quota restrictions.

CONSEQUENCE OF GOVERNMENT'S POLICY

Arguments and counterarguments could be put forward towards the policy of the government. What is important to look at is the whole problem in a 'mass' perspective than a 'class' perspective. That the policy supports a privileged class of multinationals both within and outside the country is beyond doubt. The mass of traditional fisherfolk will be further marginalised. The struggle of the traditional fisherfolk against mechanised boats and multinationals is essentially a struggle between man and machine, livelihood and greed. The three enquiry commission of the government of Kerala have pointed out the danger of overfishing with devices detrimental to the 'fauna and flora' of the sea. In the last six years certain common species of fish have disappeared altogether.

That the mechanised boats and the multinationals would destroy our sea-wealth needs no proof. The latest data of fish

production in Kerala well establish the fact. The total fish production of the state in 1990 was 6.94 lakh tonnes. It came down to 6.04 lakh tonnes in 1991 and 6.03 in 1992. Kerala's share in national fish production has dropped from 23 per cent to 20 per cent. The Maharashtra fishermen claim that their overall catch has gone down by 30 per cent. Besides mechanised boats, pollution in the Maharashtra waters could be another reason. Coastal rivers brimming with industrial effluents successfully destroy the fish in the shallower sea waters. A special problem is caused by the operation of the Oil and Natural Gas Corporation (ONGC) at Bombay's coast. Prawn beds are often found near oilfields. When fishermen approach the oil rigs they are shoed off by ONGC. Fishermen also complain that the effluent from the oil rigs has affected the fish in the vicinity. Added to the arithmetic of production is the greater danger of diseases afflicting fish. Two years ago tonnes of fish had to be abandoned and fishermen put on 'vocation' due to widespread fish disease. Several instances of people taken ill after eating fish had been reported in the print media in recent years.

The social consequence is the disintegration of fishermen's families. Here are a few interviews that would give us indicators of traditional fishermen's lives:

Says a traditional fisherman of Alleppey district, now involved in ring-seine fishery. "I have been fishing in the sea for 20 years. But now I can fish only for four to five months in a year. There is no fish for the remaining months. If I go continuously for fishing, it is a severe loss for me. Thus I am worried about my future, what will happen tomorrow to me and to my family".

Elias, living on the banks of the lake in Kollan district says: "Traditionally I was fishing in the lake. But now there is no fish there. So we all go to Ernakulam district for survival. I have a small boat. Traditionally, I was fishing in inland water, but now the inland water bodies have shrunk. And the remaining water bodies are given to private hands and contractors on lease. Small boat-owners seem to have a gloomy future, because there is no space left for them in inland or coastal waters.

Ambika from Pallithodu village in Alleppey district distressingly tells: "My father is a fisherman in Pallithodu. I have three sisters and one brother. Five years ago our whole family was involved in drying fish. But then came a time when there was no fish to dry. Now whatever fish my father catches, he immediately sells in the market. And there is no surplus fish to store or to dry. So we are idle. Hundreds of women like me went idle because traditionally in every family women are involved in this work. There is no work for me. The same is the case with my sisters and brothers, and most of the village women".

Leelamma began vending fish when she was 19 years old. She lost her husband at sea a few years ago and is now a widow. Her earnings are essential to feed, clothe and educate her children. Her husband became cynical and took to drinks, when he could not make his ends meet saying, "When the sea mother gives me alms like a beggar instead of rewarding my labour with wealth, what am I to do but drink?" What her husband told her was significant, "Some people are making liquors instead of fishing in the sea, and I am drinking liquor instead of fishing because there is no fish in the sea".

Mariamamma is a fish vendor and has been one since she was 18. She cannot remember how old she is now but thinks she must be over 30. She looks very old. Some years ago, on the advice of a wandering social worker, she had a tubectomy after two children. At that time, she had a daughter who was two months old. Shortly after her operation, she discovered that her son suffered from a kidney disease. The doctors in the big hospital in Trivandrum told her that nothing could be done for him. One young nurse advised her to look after her younger child properly since she could have no more children. Someone told her that a very big operation, costing a huge amount of money might save the boy. Mariamma prayed to god that her husband might catch a lot of big sharks which would fetch them enough money for the operation. One night, while she was praying, her husband had gone to fish in his own kattamaram. Having cast his net into the water, he fell asleep waiting for the fish. Late at night, a trawler came and hit the sleeping man. His country craft and net were badly ravaged. The kattamaram could not be reconstructed because the wood of which it is made has become very scarce and expensive, thanks to deforestation and industrial use in the manufacture of match sticks. A kattamaram has four to five logs and a new craft costs between Rs 1,500 to Rs 5,000. His ruined craft was worth Rs 5,000 and the net that was lost was Rs 2,000. Meanwhile, Mariamma's trust with doctors, hospitals, medicines, magic men and holy shrines resulted in a serious state of debt. Her husband is today a coolie in a boat. Mariamma could not look after her younger daughter as the young nurse had asked. She had to run up and down the markets to feed her family and stopped lactating. Her baby daughter was neglected and had a chronic bout of dysentery. She died when she was 11 months. Finally, Mariamma buried her elder son when he was round seven years old.

There is a clear economic and ecological advantage, besides the social benefit, in small-scale fisheries as compared with the big fish industry. The small-scale sector is well adapted to the tropical aquatic ecosystem and local fishing communities frequently

possess built-in mechanisms and rules for over-fishing.

The ecological wisdom of the traditional fishermen has always been very good, says John Kurien, social scientist from Trivandrum mentioning an old saying "never touch a shoal to the left of the boat", thereby saving it from extinction. In contrast over-fishing among trawlers is quite frequent; they destroy the ocean floor in the effort to squeeze out the shrimps with bottom trawling. Large-scale operators can sell out of one sector of operations and reinvest in another with a minimum of personal sacrifice. For the small-scale fishermen there is no such option and that is one important reason why he prefers sustainable development of fisheries.

The problem today in fisheries is not unique. It is similar to other resource-use patterns in society where the powerful appropriate the resources traditionally used by the artisanal sector. However, the blame for depleting resources is conveniently passed on to the poor as their sheer numbers frightens the authorities. India cannot ignore the fact that the employment generated in the large-scale fishing operations is only 100 of small-scale fishing for every crore of investment. Even the fish catch compared to the fuel consumed by the big fleets is one-fifth less than in the small-scale fishing sector.

The conflict between the small and the powerful in the fishing industry is not just a matter of resource conservation, economics or legislation. It is a socio-political problem dealing with the ultimate survival of fishing communities and the many millions of people they represent.

The stress of India on exports is pushing the flow of protein from the needy to people who can provide the foreign exchange. The supplies of fisheries resources for the poor are reduced further because the market system tends to move fish towards those with higher incomes. Most of the fish in international trade goes to more highly developed countries. "Of the fish that is consumed directly, most goes to people who already have enough food. Only a relatively small share goes to those who are at risk of undernutrition", says George Kent of Hawaii University pointing out the fact that people in developed countries consume more than four times as much fish as consumed in developing countries.

Fish cannot be replaced by anything else in the nutritional programme for the poor. Fish resources are well distributed all over the world and so fishery products are geographically within the reach of most consumers. Given the good nutrient properties of fish, its widespread availability means that it has a better potential for meeting special nutrient needs than other nutrient distribution systems, such as vitamin pills or fruitified foods. Also, a relatively small increase in total protein intake obtained by

adding a few grammes of fish protein to a cereal-based diet, greatly enhances the nutritional quality of the cereal protein.

The government has to demarcate the areas of small fishermen and industrial fisheries very clearly. Malnutrition problems can in no way be solved except by providing fish at prices which the poor can afford. This can be done by the small-scale fisheries sector who have the capacity to keep their overhead costs low, provided they do not have to compete with hawlers. Any good fisheries programme should be able to pass five major tests as devised by Galhug contributing more protein to the most needy, leading to better standard of living for fishermen, contributing to more egalitarian social structures, strengthening the ecological balance and protect aquatic life.

To give the fisherfolk a hope for the future, it must be remembered that the crux of the fisheries policy is their welfare and not the short-term maximisation of foreign exchange; to protect aquatic life and the life of the fisherfolk, instead of short-term appeasement measures, which in some cases actually create cleavages between the better-off fishermen and their less privileged brethren, a clean break with the past is imperative, and a new beginning.

To fight for their right for existence the traditional fisherfolk had organised a nationwide fisheries bandh on February 4, 1994. No fishing vessel ventured into the sea and the whole sale and retail markets remained closed. In June 1994, the representatives from the nine coastal states met in Kochi and formed the National Fisheries Action Committee against joint ventures under the chairmanship of Thomas Kocherry. The Committee has demanded cancellation of all licences issued to joint ventures. As per the decision taken by the committee, July 20 was observed as Black Day in all the coastal states. The committee had decided to launch an indefinite all-India fisheries strike from November 23, 1994. Foreign fishing vessels were not permitted to come to the ports for refuelling.

In their memorandum addressed to the prime minister, the National Fisheries Action Committee has given a clear statement of their opposition against the new deep sea fishing policy. Their reasons are the following: The policy is destructive since it would mean loss of control over the nation's resources. The government will have no way of knowing the size and the nature of the catch and catch values. It will be thus difficult to monitor the depletion of marine resources. The foreign vessels are likely to overfish and a large number of species will be wiped out. Moreover, since foreign fleets have highly specialised technology, the skilled jobs will be occupied by foreigners. Only a few menial tasks like those of a deck-hand and cook will be available for India labour. There will be no need for shore-based jobs

since processing, grading and packaging of products will be done on board the ship.

Since these fishing activities are 100 per cent export-oriented, the Indian people will be denied fish for domestic consumption. Fish provide 29 per cent of the animal protein eaten in Asia. Pressure from foreign fleets and export-driven policies will mean that even as the catch increases, there is lesser supply of fish for domestic consumption. Many varieties of fish included in the Indian diets are exported to make fish meal and animal feed. There are now cases of Vitamin A deficiency even among children in fishing villages. This problem would not have occurred if fish was available for domestic consumption.

The National Fishworkers' Forum has therefore urged the government to reconsider

its deep sea fishing policy. They are in favour of a new policy which would give more importance to the small-scale fishermen for the harvesting of the deep sea resources. Incentives in the form of subsidies and credit should be provided for the fishermen. The government should also ensure supply of fish for domestic consumption. All round efforts should be taken to maintain India's marine wealth at sustainable levels. Overfishing should be avoided and there should be no depletion of our marine resources. Will the government pay heed to the just demands of the fishermen? Is there hope for our seas? Should we wait till things become unmanageable and then pronounce that it is now necessary to have a total ban on all fishing for some years?

The Centre for Science and Environment an established research institute is now developing its library and information services unit into a more vibrant outreach centre. The Centre needs to augment its senior team to manage this unit.

ASSOCIATE DIRECTOR (INFORMATION SERVICES)

Will be overall incharge of the development and management of the environmental resources unit; must be a professional in information sciences; have at least 5 years experience in senior position combining administrative as well as documentation skills. Candidates with exposure to electronic mail, and in dissemination of information services will be given preference.

DOCUMENTATION COORDINATOR

Must also be a professional in information sciences with at least 3 years experience in senior position.

DOCUMENTATION COORDINATOR (AUDIO VISUAL RESOURCES)

Will be incharge of development and management of the audio-visual resources; slides, photographs, video etc. Candidates with experience with multi-media documentation will be given preference.

Salaries and benefits will match the best in industry. Apply with full details to:
Deputy Director,
Centre for Science and Environment,

REVIEW OF POLITICAL ECONOMY

China's Tryst with Globalisation

Nirmal Kumar Chandra

This paper attempts to show how, rejecting neoliberal diagnoses on many occasions, China has created a transitional economic system that combines in a most original way seemingly contradictory elements of central and local planning, the domestic market and a relatively small window looking out into the world outside. If the mix was very much of their own concoction, the Chinese have learnt copiously from their own past and from the USSR as well as their own neighbours such as Japan, South Korea and Taiwan. The author's objective is not so much to chronicle the story, but to look for policy recipes for others, both developed and developing countries, underscoring the counter-productive nature of the neoliberal dogma.

CHINA is the latest, *fin de siècle* economic miracle from east Asia to have dazzled the world. Between 1965 and 1990 her national income (net material product) at constant 1985 prices increased six-fold. In 1980-92 the per capita GNP galloped at 7.6 per cent per annum, surpassed only by South Korea's 8.5 per cent. China's export in \$ billion jumped from 2.6 in 1965 to 91.8 in 1993, while imports soared from 2.1 to 104 over the same period. The object of this essay is not so much to chronicle the story, as to look for policy recipes for others. However, policies at one point of time cannot be examined in isolation from what happened before, unless one is a faithful member of the neoliberal fraternity for whom there is only one standard set of prescriptions to cure all ailments irrespective of historical time and geographic space. On several occasions in the following pages I take issue with neoliberal diagnoses on China, showing why these were rejected, and in the process was created a transitional economic system that combines in a most original way seemingly contradictory elements of central and local planning, the domestic market, and a relatively small window looking out into the world outside. If the mix was very much of their own concoction, the Chinese learnt copiously from their own past, and from the USSR as well as neighbours like Japan, South Korea and Taiwan.

The paper is divided into two parts. Part A scrutinises in some detail the external transactions of China since 1982 to the present. Section I shows how the country has of late become very important for the rest of the world in providing opportunities for investment, hogging the attention of western media. Sections II to VII examine at length the components of China's balance of payments (BOP), and it is shown that China had basically followed a strategy of balanced trade, equilibrium in current account, and parity between the inflows and outflows of capital. The question of capital flight from China is taken up in Section VIII.

Part B of the paper seeks to piece together the contours of the transitional economic system. After underlining the continuity and change between the cultural revolution

and the present phase of Reform in Section IX, current policies in respect of import, foreign investment, local enterprises and local planning, and central planning and state-owned enterprises, are analysed in the next four sections; parallels with contemporary India are drawn on a number of occasions to highlight the contrasts. Section XIV explores China's tactics in the

ongoing negotiations on her entry into the GATT

The concluding section begins by noting the dark clouds looming over the horizon which may erupt in a social turmoil. Finally, I draw a few lessons from China's experience, for both developing and developed countries, underscoring the counter-productive nature of the neoliberal dogma.

PART A: EXTERNAL TRANSACTIONS

I

Lure of China

That China has been importing capital on a large scale since the early 80s is a story familiar to all. Data from the world bank's *World Development Report (WDR) 1994* are reproduced in Table 1. The absolute size of China's total debt in 1992 was smaller than that of a number of countries including India, but the increase in 1980-92 by nearly \$ 65 billion overshadows that for every other country barring Russia, which is a special case insofar as it inherited all debts and assets of the erstwhile Soviet Union. As for long-term debts, the outstandings at the end of 1992 were again somewhat lower in China than in a number of others, but the rise over 1980-92 is the highest, leaving aside Russia.

Turning to aggregate resource inflows in 1992, including grants, loans and foreign direct investment (FDI), China occupies the pre-eminent position (Table 1A). As much as \$ 22.6 billion were pumped into China, or 50 per cent more than into Russia, over 100 per cent *vis-a-vis* Mexico (in anticipation of the NAFTA), and so on. China's share in the total inflow into all non-OECD countries (\$ 139.4 billion) was about one-sixth. In respect of FDI, China dwarfed everyone else by a bigger margin, with \$ 11.2 billion coming in, she was way ahead of Mexico, Argentina and Thailand, and accounted for nearly 28 per cent of the total for non-OECD countries.

During 1993 the inflow into China shot up to dizzy heights. According to the Chinese minister of planning (*Beijing Review*, April 11, 1994), 'foreign capital used' jumped to \$ 36.8 billion, or a 91.5 per cent increase over the previous year. The implicit figure for 1992 in \$ 19.2

billion which is less than that in Table 1A by \$ 3.4 billion, suggesting a lack of full compatibility between the two sources. But the underlying trend is unmistakable. FDI into China amounted in \$ billion to 25.8 in 1993 and 11.2 in 1992, according to the Chinese estimates, the latter coincides with the figure in Table 1A. While data for other countries are awaited, there is little doubt that China accounted for much larger shares in 1993 over those in 1992, of both aggregate resource inflow and FDI.

According to a Chinese official, actual FDI during the first half of 1994 was \$ 14.7 billion or 55 per cent above that in 1993, but 'foreign investment contracted' was \$ 4.4 billion or down by 25 per cent. The fall was attributed mainly to the real estate sector accounting for 38 per cent of the 1993 contracts. Of late, the government disallowed tax-free import of cars by joint ventures (up to 10 per cent in some regions) which had no foreign capital at all (*Reuter* report in *Business Standard*, August 8, 1994). In some special Economic Zones, according to *The Economist* (August 6, 1994, p 57), one could earlier pledge just \$ 3,00,000, deliver a bare 5 per cent of this sum, and import duty-free cars. One joint venture in printing brought in equipment worth \$ 50,000, but declared its value at \$ 2.5 million. Besides, 'a good part' of inward FDI was really from domestic investors who persuaded officials to attribute it to various Hong Kong holding companies (see below). Hence the fall in the value of contracts may not signify much. The latest figures show FDI in January-September 1994 at \$ 22.7 billion, or 49 per cent above that in the corresponding months last year. China is already the world's second-most important destination of FDI, eclipsed by the US with \$ 32 billion in 1993; soon China is expected to emerge

at the top (*Reuter report in The Economic Times*, November 28, 1994, p 2).

One way of assessing the importance of FDI is to compare the annual inflow to gross fixed capital formation (GFCF) in the country. This percentage, according to the UNCTAD's *World Investment Report 1994* (Annex Table 5), was insignificant during 1981-85, averaged 2.1 during 1986-90, and rose to 3.1 in 1991. The same *Report* (Annex Table 3) also indicated the stock of FDI at \$ 29.7 billion at end-1992. As shown later, estimating the stock from the cumulative inflows into China is apt to be misleading; so is the ratio of inward FDI to GFCF for China. It would be equally wrong to infer that 'foreign' saving through FDI contributed 3.1 per cent of total savings in the early 1990s; for, China's outward FDI was also very large, and the net foreign contribution was probably negligible, if at all positive. Despite this caveat there is no gainsaying the fact that inward FDI plays a major role in China from a qualitative rather than a quantitative perspective.

II BOP and Reserves

If a country is a net importer of capital over a period, accounting rules suggest that it should have, (a) a deficit in the current account of the BOP, usually with a trade deficit as well, and (b) a surplus in the capital account to neutralise the last. The cumulative totals, as shown in Table 2, tell a different story. In presenting the data, I have used the sub-periods, 1982-84, 1985-89, and 1990-92, taking into account the signs of the current account balance; the latter was consistently positive for each of the years during the first and the last sub-periods. Except for a small surplus in 1987, there was a deficit in all other years during 1985-89. The trade deficit over the whole period, 1982-92, amounted to just \$ 5.5 billion, while the current account, inclusive of 'unrequited transfers' of \$ 5.3 billion, showed a surplus of \$ 18.2 billion; during 1990-92 the current account surplus was astonishingly high at \$ 31.7 billion. Evidently, the trade balance is less reliable than the current account balance in assessing the 'need' for foreign capital inflows. Thus a developing country with substantial inflows from tourism or migrant workers remitting a part of their earnings abroad, can live with trade deficits without getting into the external debt-trap.

What does the capital account in Table 2 show? Excluding foreign exchange reserves (Reserves), the capital account was positive at almost \$ 44 billion in 1982-92; including Reserves, the surplus dwindles to a mere \$ 4.2 billion, as the former went up by \$ 39.7 billion. The major (net) capital inflow took place in 1985-89 when the current account had a massive deficit of \$ 26.3 billion, the

capital account, excluding Reserves, had a surplus of \$ 31.8 billion, and Reserves went up by \$ 2.2 billion; these appear to be quite plausible. A dramatic change took place in the three years, 1990-92, when the corresponding figures in \$ billion were all positive at 31.7, 11 and 24.5 respectively. Thus in this last triennium China had an exceptionally large current account surplus, a moderate one in respect of capital account (less Reserves), and a huge build-up in Reserves. In fact, the Reserves stood at nearly \$ 44 billion at the end of 1991, and were run down by only \$ 2.1 billion during 1992. Actually, from July 1992 the foreign exchange holdings of the Bank of China were no longer considered part of the Reserves which dropped to just \$ 20.6 billion at the end of the year (*IFS Yearbook 1993*). It can be estimated that in 1991 the reserves with the central bank, People's Bank of China, were \$ 22.7 (= 20.6 + 2.1) billion, and hence those of the Bank of China totalled \$ 21 (= 43.7 - 22.7) billion.

What happened to the assets of the Bank of China? Obviously, these funds have been deployed abroad. Once these were taken out of the Reserves, the BOP should have reflected a corresponding increase in China's foreign assets on some other head in 1992; but it does not. Apparently, this enormous sum was simply taken out of the sight of all but the Chinese authorities. But not for the US Treasury which still puts China's current Reserves at \$ 49.9 billion. As expected, the Chinese authorities have dismissed the claim and stick to the lower figure cited earlier (*Beijing Review*, August 22, 1994, p 5). A glance at the Reserves of different countries shows that only Germany, US, Japan and probably Taiwan, held larger sums than China in 1991, and the same would be true for 1992 if the latter's 'hidden assets' were reckoned with (*IFS*, November 1993).

Three further points may be noted. Firstly, over 20 per cent of Hong Kong's currency notes are actually circulating in south China, while a total of about US \$ 6 billion is held as deposits in Hong Kong banks by Chinese banks, though the Hong Kong Monetary Authority does not consider these funds to be controlled by the Chinese government (*Financial Times* report in *Business Standard*, July 23, 1994). Secondly, the Bank of China and its affiliates in the territory constitute the second largest banking group in Hong Kong; the bank was authorised earlier this year to print notes worth HK \$ 3 billion, or 4 per cent of the total in circulation (*Beijing Review*, May 9, 1994, p 6). Thirdly, China's Reserves are likely to go up substantially once Hong Kong ceases to be a British colony. The fiscal surplus, according to Hong Kong's budget forecast, will amount to HK \$ 141 billion in March 1998, while land sales will add another HK \$ 128 billion;

or a total of about US \$ 37 billion will accrue to China (*FEER*, March 17, 1994, p 18).

While I have so far utilised the BOP current account data, the US government believes that the export figure of \$ 69.6 billion for 1992 understates the 'true' magnitude, estimated from partner countries' imports, by as much as \$ 9 billion or by nearly 13 per cent (*Reuter report, Business Standard*, July 23, 1994). As argued later, this may not be the appropriate procedure for China.

III Loan Capital

To what extent does the BOP capital account explain the rise in China's long-term external debt as estimated by the World Bank and shown in Table 3? The debts increased between 1981 and 1992 by \$ 52.7 billion. Regarding the capital account of the BOP (Table 2), I consider the following long-term debt inflows: drawings and repayments on other loans received by resident official sector (65 and 66), drawings and repayments on other loans received from deposit money banks (74 and 75); drawings and repayments in respect of suppliers' credit obtained by China (81 and 82); and portfolio investments (53 and 58). The figures in parentheses refer to the IMF code or line numbers. For different periods these BOP totals (in \$ million) are compared to the World Bank estimate of long-term debt flows as follows.

	BOP	World Bank	Difference
	(1)	(2)	(1-2)
			(3)
1982-84	2,560	905	1,655
1985-89	26,028	30,864	-4,836
1990-92	4,973	21,432	-16,459
1982-92	33,561	53,201	-19,640

The average annual gap between the two estimates was moderate at \$ 550 million in 1982-84, turned negative at almost \$ 1 billion in 1985-89, and rose steeply to \$ 5.3 billion in 1990-92. What does the gap represent for the years since 1985? The BOP data on loans received by the official sector have corresponding entries on official loans extended by China; similarly, those on suppliers' credit from abroad are matched by export credit from China. I suspect that figures on long-term banking capital do not correspond to the common sense meaning of the items, and may include transactions of banks owned by China, but incorporated abroad, especially in Hong Kong. Loans from bank branches in the mainland to the head offices in Hong Kong would appear with a negative sign in the capital account, and could hence be set off against loans received by China from foreign banks based in OECD countries. Only the latter, but not

the former, are reported in the *World Debt Tables (WDT)* or in the publications of the Bank for International Settlement (BIS) and the OECD. This is admittedly a crude guess, and the exact mechanism may be quite different.

If one is to trust both the World Bank debt statistics and the Chinese BOP, the gap can only represent the 'hidden' long-term foreign assets built up by China, totalling nearly \$ 20 billion during 1982-92; the overwhelming bulk of the outflow took place in 1990-92.

Long-term loans extended (net of repayment) by China are shown in rows (4ai) of Table 2. The net outflows on these heads in \$ billion were 1.4 in 1982-84, 2.1 in 1985-89, 3.5 in 1990-92, and 7 in 1982-94. Thus in respect of long-term loans, against China's liabilities at the end of 1992 of \$ 58.5 billion, the assets should have been around \$ 27 billion, i.e. the sum of 'hidden' outflows and the declared volume of net loans to foreign countries.

Regarding short-term capital, the World Bank reports China's debt at nil for the years up to 1982, which rises in \$ billion to 5.6 in 1984, 6.9 in 1989, and 10.8 in 1992; barring a couple of years, there is a moderate, but steady, increase over the period. From the BOP figures in Table 2, it is not possible to unscramble the inflows as recorded by the World Bank, from the outflows; the overall net outflows in \$ billion were 2.1 in 1982-84, 1.3 in 1985-89, and 3.7 in 1990-92, totalling 7.1 over 1982-92. It follows that the cumulative outflow (gross outflow less repayments) of short-term capital from China was \$ 17.9 (= 7.1 + 10.8) billion, which was partly offset by outstanding liabilities to foreign-owned banks, etc., to the tune of \$ 10.8 billion at the end of 1992. As with long-term capital, most of the short-term outflows were concentrated in 1990-92.

Combining the long- and short-term outflows in the form of loans, 'hidden' or otherwise, China's foreign assets under these two heads amounted to nearly \$ 45 (= 27+18) billion at the end of 1992. I looked at the

BIS-OECD estimates of China's total debt over the years 1983-88; the former exceeded the World Bank's by a significant margin. Thus in 1988 the former put total debt in \$ billion at 49.7, including 16.5 of short-term debt; the corresponding World Bank estimates were 42.4 and 8.8 respectively. The major discrepancy lies in the size of short-term debt. If the gap persisted till 1992, the higher estimates would imply that China had a bigger stock of both foreign assets as well as liabilities. If the OECD estimates are preferred, China's foreign assets would well exceed \$ 45 billion in 1992.

IV

Investment Incomes

Next, consider the income flows in the current account due to investments, long-term as well as short-term, but excluding inward or outward FDI. The World Bank's *WDT* indicate interest payments by the borrowing countries separately for long-term debts, IMF charges, and short-term debts. But the BOP provides a different classification from which these items cannot be segregated; hence only the overall investment (non-FDI) income outflows can be compared to the World Bank's.

The BOP outflows were generally smaller than the World Bank estimates till 1989. In \$ million the former totalled 1,859 in 1982-84, and 7,188 in 1985-89 against the latter's 2,641 and 9,458 respectively. In 1990-92 the BOP estimate was slightly higher at \$ 10.8 billion against \$ 10.3 billion of the World Bank.

What is remarkable is that the inflows of income from non-FDI investments in the BOP generally exceed the outflows noted above, barring, just 4 years, viz. 1986-89. If one takes the sub-periods as before, the net inflow amounted in \$ billion to 2.6 in 1982-84, 0.25 in 1985-89, 1.9 in 1990-92, and 4.7 in 1982-92. If the BOP data on outflows were replaced by those of the World Bank, there would still be a net inflow in \$ billion of 1.8 in 1982-84, -2.0 in 1985-89,

2.7 in 1990-92, and 2.5 in 1982-92. In other words, in most of the intervals China earned more than she paid out. There are very few, if any, developing countries in a similar situation. It implies either that China's foreign loan assets have generally exceeded her debts, or that the former earned significantly higher rates of return than the latter.

Neither hypothesis can be dismissed lightly. It is evident from the earlier sections that a good part of China's loan assets abroad are 'hidden' and another sizeable part consists of funds that are unlikely to have been deployed in low-yield but risk-free Treasury bills, etc., of OECD countries. Assuming that all her Reserves of \$ 20.6 billion were tied up in this way, the latter would constitute no more than 20-25 per cent of her total non-FDI assets.

As for China's own debts, the overwhelming bulk of these were contracted at market rates, the share of concessional loans, i.e. bilateral development assistance and aid from multilateral agencies, in the total being rather small. According to the World Bank, this percentage rose from 8.3 to 15.2 during 1983-89, and further to 16.5 in 1992. It is worth noting that the share of 'official' creditors (i.e. inter-governmental and multilateral loans) in the total was somewhat higher than that of concessional loans and ranged between 21.1 per cent and 24.4 per cent during 1983-89 (*WDT*, and *WDR*, various issues.) Not all official loans were on concessional terms.

The upshot of the discussion is that the rates of return on China's loan assets abroad could not far exceed those on her own debts. Considering that the net income flows on this score were generally positive, especially since 1990, it is unlikely that China's assets were much lower than debts for most of the period.

V

Inward FDI

China, as seen before, has the largest inflow of FDI. As the BOP inflows are net of capital

TABLE 1 DEBTS OF SELECTED HIGHLY INDEBTED COUNTRIES

(\$ million)

	Stock of Debt		Increment in Debt	
	Total 1992	Long-Term 1992	Total 1980-92	Long-Term 1980-92
Argentina	67,569	49,079	40,412	32,305

Thailand	3,836	2,116

Source: As above.

repatriation, the cumulative total at the end of 1992 was \$ 33.8 billion. In 1993 there was a quantum jump by \$ 25.8 billion, signifying a 2.3-fold rise over the 1992 inflow or a 57 per cent rise in the stock in the course of the year. China has also a very sizeable outflow, totalling \$ 9.4 billion in 1982-92, of which \$ 4 billion went out in 1992 alone.

As against the BOP figure, the Chinese minister for foreign trade and economic co-operation put the amount of foreign investment at \$ 60 billion in early 1994 (*FEER*, May 2, 1994, p 6). The chief economist at the Research Institute of Japan's leading securities firm, Nomura, Chen (1994), put an even higher value of about \$ 75 billion; "since 1979 direct investment in China from Hong Kong, including foreign investment routed through the territory, has amounted to around US \$ 50 billion on an implementation basis – more than 60 per cent of China's foreign investment [emphasis added] My presumption is that the Chinese minister as well as Chen were not referring to FDI in the strict sense, but rather loosely, lumping together equity and loan capital for the foreign-funded projects, moreover the figures just cited may include Chinese contribution to the joint ventures

The accounting system of China in respect of FDI is very different from that of other countries. The current account items (IMF line codes 11 and 12) on 'reinvested earnings' in the BOP are uniformly blank; those on 'other direct investment income' (codes 13 and 14) are paltry at \$ 125 million for outflows and \$ 75 million for inflows over the whole period, 1982-92. Dividend inflows in 1990-92 were nil, and the outflows in 1992 was just \$ 22 million, i.e., a return of 0.1 per cent on the accumulated stock at the end of 1991. None of these figures is plausible. It suggests that returns to FDI in China take a somewhat 'devious' route, which needs a deeper probe.

The very fact that there is almost an avalanche of FDI into China rules out the possibility that the profit rates have been low. According to one estimate, 'the rate of success of corporate ventures' (defined as meeting the original profitability forecasts) in Shanghai is 94 per cent, and as many as 28 of the 100 largest global firms are carrying on business in that city. A survey by the US China Business Council found that 46 per cent of American businesses in the whole country earned higher than expected profits against a mere 7 per cent that were disappointed (*FEER*, June 23, 1994, p 55).

How were the profits repatriated? In the absence of disclosure by the Chinese authorities or foreign investors, one can only make informed guesses. In his context, one may refer to two recent reports. (a) A 1993-survey by the Federation of Hong Kong Industries which counts some of the colony's

biggest manufacturers among its 2,000-odd members, found that despite rampant corruption and chaos in China's regulatory framework, 90 per cent of its member companies put up factories in Guangdong province with an investment of \$ 2.2 billion, and a workforce of 7,25,000. The report adds, "Hong Kong's cumulative investment in Guangdong totals US \$ 17 billion or about 80 per cent of all foreign investment there" (*FEER*, September 23, 1993, p 78). (b) According to another report, out of 7,000 joint ventures in Guangdong, many exist only on paper; the same owners simply form new companies every time the two-year tax holiday runs out" (*FEER*, November 25, 1993, p 52).

As for (a), what was the value of net investments by the Hong Kong companies – \$ 2.2 billion or \$ 17 billion? The implicit value of investment per worker would be either \$ 3,034 or \$ 23,448. According to Lardy (1992), the mean capital per worker in the five export sectors of China, viz., apparels, textiles, miscellaneous manufactures, telecommunication and sound recording equipment, amounted to 13,991 yuan in the early 1990s; converted into dollars at the prevailing exchange rate, Lardy's estimate gives credence to the lower figure on Hong Kong's investment in Guangdong.

It follows that although inward FDI in the BOP (Table 2) or *WDR* is presented as 'net

inflow', it would be misleading to consider the cumulative inflows over the years as the end-period stock. After all, the Hong Kong firms just cited accounted for more than one-half of the cumulative inflow of \$ 33.8 billion into the whole of China till 1992. One reason behind the liquidation of 'old' FDI, which is never reflected in the BOP, is cited in (b) above

Certain other practices reinforce this conjecture. Many foreign companies in China have complained about the fuzzy regulations to discourage profit repatriation. Further, Japanese firms which greatly expanded their investment in China from under \$ 400 million in 1991 to over \$ 1,000 million in 1993, reported that they faced demand for 'foreign exchange balance' from the Chinese side (*FEER*, September 9, 1993, p 46).

I guess that the (implicit) income flows related to FDI are incorporated in merchandise trade figures with tacit support from the Chinese authorities. Indeed, foreign ventures, wholly or partly owned by foreigner, account for a significant and increasing part of China's overall trade. According to Kueh (1992), the three types of 'sanzi', viz., equity and contractual joint ventures, and wholly foreign-owned firms, had combined percentage shares of 5.2, 9.2, 12.6 and 16.8 in China's total exports from 1988 to 1991; the corresponding figures for import were 14.3, 19.7, 23.6 and 26.6,

respectively. Lardy's (1992) table on exports through joint ventures tells a similar story: the value in \$ billion rose 1.2 in 1987, to 4.9 in 1989, and 12.1 in 1991, the percentage vis-a-vis total export (Table 2) being 3.4, 11.3 and 20.5 in the same years. Ash and Kueh (1993, p 725) have shown that total export from Guangdong province increased in \$ billion from 8.2 in 1989 to 13.7 in 1991, the percentage shares of FDI-related export being 36 and 45, respectively, the corresponding totals for import were 4.8 and 8.5, with the percentage shares at 40 and 53, respectively.

Furthermore, decisions on export, import, FDI, etc. are highly decentralised in China; the power of the central authorities may well be weaker than in most countries. Not individual enterprises, state-owned or private, but rather local authorities from the provinces down to the townships have acquired enormous power of late (Section XII below).

I visualise the scenario as follows. In the export of textiles, garments and a host of light engineering products, overseas Chinese firms play a major role. Consider a Hong Kong capitalist entering into 'co-production' or 'joint venture' with a Chinese partner over a finite period; the equipment are imported into China as inward FDI in the capital account, and merchandise import in the current account, but the agreement does not typically provide for capital repatriation at the end of the contract period. The Hong Kong capitalist could realise profits by overcharging for the machinery supplied to

the joint venture, and under-invoicing exports. In the early 1980s, many joint ventures had a life-span of 10 years with no provision for automatic renewal (*FEER*, September 1, 1994, p 53). Out of a total of 145 Taiwanese investment in Xiamen province in 1988-89, Luo and Howe (1993, p 757) found that 'life terms' of FDI ranged from 10-19 years for 45 firms, 20-29 years for 35 firms and over 30 years for 45 firms. The average term was shorter in the earlier period. Further, some 60 per cent of China's export to the US is routed through Hong Kong (*FEER*, March 17, 1994, p 18), enabling Hong Kong businessmen to add on a profit margin.

What about other types of joint ventures of a long-term nature? so long as these are engaged in export, profits can be earned as before through appropriate pricing of the initial import of goods and recurrent exports. The scenario should be no different for import-substitution activities, e.g. foreign firms in soft drinks, automobiles, steel, etc. Since these firms typically import raw materials and/or components from year to year, the authorities may allow them to overcharge in lieu of profits for their operations within China, or, they may be compelled to earn their profit through counter-trade.

If the story just painted broadly conforms to the Chinese reality, then there is no need for separate BOP entries on dividend outflow and reinvested earnings. Does it also imply that the BOP values of export (import)

significantly understate (overstate) the 'real' values, in the sense that the same goods would fetch (cost) much more (less) if trade took place with unrelated firms from abroad? Apparently, that is the case: the extent of distortion is measured in some studies by examining trade data from partner countries, as noted below. But then Chinese firms may have lacked access to OECD markets; without a margin for, say, the Hong Kong partners, such exports may not have taken place at all. As for 'overvalued' imports, the loss on this score have to be balanced against the alternative of dividend outflow and capital repatriation. The desirability or otherwise of the current practice from China's standpoint can hardly be established in the absence of more information which may never be available. If one recalls that FDI in developing countries generally lead to a huge drain of resources, the merits of the Chinese system is all too apparent, especially in the context of decentralised decision-making. Since foreign exchange balance is stipulated for each project, it obviates the need for cumbersome monitoring by Beijing of repatriation of dividend or capital. It is not surprising that foreign investors and their home governments are voluble critics of this stipulation.

VI Outward FDI

On the other hand, the actual stock of Chinese FDI abroad may well exceed by a

Sources and explanations: See Table 2

big margin in the cumulative outflows revealed by the BOP. The chief economist of Japan's Nomura Research Institute, Chen (1994) estimated China's 'existing direct investment' in Hong Kong at \$ 20 billion at the end of 1993 or double the level reached three years earlier. According to Merrill Lynch, another leading investment banker from the US, six Chinese firms that got listed at the Hong Kong Stock Exchange (SE), had a market capitalisation of about \$ 2.2 billion at end-1993; 22 pipeline cases may raise a further \$ 6 billion from the market. Among the backdoor listings (below) the most important was CITIC Pacific with a 1993 turnover of \$ 2.4 billion ('The 1994 Guide to World Markets', *Euromoney*, June 1994, pp 45-47). According to another recent study by Edward Chen of Hong Kong University, Chinese investments in Hong Kong "was more or less the same as that of Hong Kong investment in China. The British colony accounts for 65 per cent of total [foreign] investment in China" (*Reuter* report in *The Economic Times*, October 28, 1994, p 2).

The *modus operandi* of Chinese enterprises raising funds through the Hong Kong SE since October 1992 when nine of them were first listed, is described in an interesting report by Sender (*FEER*, February 10, 1994, p 50). Out of the nine, in early 1994 six shares were traded at a substantial premium over the initial issue price. Hong Kong has become the world's sixth largest exchange 'thanks partly to inflows of overseas orders', according to the SE's chief executive. Investors, however, face a risk. Disputes may arise when the "issuers come from a country that has no capitalist law and list in a place with a well-defined legal structure". Who exactly is the 'state' when it comes to the majority of newly created joint companies? One legal expert in Hong Kong confessed ignorance about 'who actually controls' the shares in China. The problem is compounded by the fact that relatively dormant 'shell companies' listed in the SE, are bought up by Chinese firms who thus gain backdoor entry into the SE. At the same time, there was widespread insider trading. Thus, for no apparent reason, the share price of Conic Investment shares soared 1.6 times on February 9, 1994 to a little over HK \$ 1; on April 28, against the prevailing market price of HK \$ 2.70, China Aerospace offered just HK \$ 1.4 per share, acquired the Shell company, and in the next couple of weeks its price shot up to a peak of HK \$ 7, Hong Kong regulators suspect that managers of mainland firms personally buy substantial stakes before the parent firm starts bidding. Since premiums of US \$ 12.8 million were common, the gain from insider trading was considerable. A vexed issue pertains to land-use rights in China; Chinese firms, it is widely suspected, grossly overvalue it in order to command large premiums in the SE.

Besides, land-use rights in China are quite complex. Can the Hong Kong regulators afford to maintain objective standards, losing in the bargain major clients to other SEs? Since September 1992 New York began listing Chinese firms without raising awkward questions faced by applicants from the US or elsewhere. The dilemma is all the greater if the Chinese firm is headed by a person with strong political connections. For instance, four major companies listed in Hong Kong, namely, China Asset Holdings, Poly Investments, China Venture Capital, and Concord Grand Holdings, are headed respectively by two sons-in-law, one daughter, and one son of Deng Xiaoping, and each major company had one or more affiliates in Hong Kong.

Another big name, Shougang Corporation, is China's steel-making giant and in the charge of Zhou Guanwu who had served under Deng way back in the 1930s. Its Hong Kong arm is headed by Zhou's son, Zhou Beitang, and controls six listed companies with a total market capitalisation of \$ 1.7 billion, and half-yearly sales in 1993 of about \$ 350 million. In some of its deals, Shougang allied with Deng Xiaoping's son, Deng Zhifang. The young Deng is an aspiring property developer who has teamed up with firms in Hong Kong sponsored by the People's Liberation Army, to build luxury villas. Shougang plans to build six shopping centres in China at a cost of \$ 250 million in a 50:50 partnership with one of Deng Zhifang's privately owned companies in Hong Kong. Shougang also plans a \$ 6 billion steel mill in China's Shandong province, of which 45 per cent will come from foreign investors (C Goldstein, *FEER*, February 10, 1994, p 54).

Another major player is China Resources Enterprise, it is listed in Hong Kong, had a turnover of \$ 6.5 billion in 1992, and acquired a 50 per cent stake in Hong Kong Chinese Bank in 1993. Closely linked to the Chinese ministry of foreign economic

relations and trade, it benefited from an injection of \$ 410 million from the parent over the years (*FEER*, June 16, 1994, p 61).

China International Trust and Investment Corporation, better known by its acronym, CITIC, occupies the pride of place among China's transnationals with total assets spread over US, Canada, Europe, Australia and Hong Kong, exceeding 80 billion yuan or about \$ 10 billion; it has a workforce of 30,000. It was founded 15 years ago by Rong Yiren who was already a well known capitalist in pre-liberation China, and has been a deputy of the National People's Congress for the last 40 years, including shorter spells as the Mayor of Shanghai and a central minister. A favourite of Zhou Enlai, Rong was specially requested by Deng Xiaoping in January 1979, to 'set aside other work and concentrate on economic construction centred on opening to the outside world, foreign exchange earning and exploring some new [a]venues for economic progress. Deng made it clear [that] China could make use of some useful capitalistic practices. He also appointed Gu Mu, then vice premier, to maintain direct contact with Rong to make sure things went smoothly. Whenever he met difficulties, Rong wrote letter to Deng, who always fully supported him by answering his letters with detailed instructions, and asking concerned departments to give Rong the green light.' In 1984 Deng presented an inscription to the CITIC, calling it 'a window of China's opening up to the outside world'. As for Rong's own philosophy, he once told his wife, "for me, the state always come first, the company second, and my family third." He has ceased to head CITIC, and became China's vice-president in 1993 (Wei, *Beijing Review*, August 29, 1994). The CITIC Pacific mentioned earlier, is a CITIC subsidiary, and holds 12.5 per cent of the equity in Cathay Pacific airlines, one of the world's largest; besides, it has a 46.2 per cent stake in Dragon Airways which is regional in

character. In 1993 CITIC Pacific along with Swire Pacific, the major shareholder in Cathay Pacific, put in a \$ 2.2 billion bid for a real estate on the Kowloon island of Hong Kong (*FEER*, January 27, 1994).

Over the last decade or so, the Chinese military have set up at least 20,000 business ventures, primarily within the country, but also abroad. The earnings from this source is reported unofficially at 43 billion yuan, matching the country's defence budget. Poly Group Corporation is the main arms exporter for the People's Liberation Army (PLA). The latter's General Logistic Department (GLD) is the umbrella organisation. China Xinxing Corporation, a sprawling conglomerate under GLD, signed investment contracts worth \$ 1.2 billion in July 1993 at a Hong Kong exhibition. Firms under GLD earned over 6 billion yuan (over \$ 1 billion) in 1992, but many under-reported their income in order to evade payment to GLD; the audit report for the same year put unreported income at one-sixth of the total. The GLD firms have a large presence in Guangdong, and above all, in the Special Economic Zone of Shenzhen, next to Hong Kong. While few details of foreign operations have surfaced, the PLA has started many companies in Hong Kong, some of which are engaged in hi-tech activities. Ostensibly a CITIC subsidiary, Poly Group Corporation, actually belongs to GLD and is a major Chinese transnational with a revenue of \$ 1 billion in 1992; it has around 100 subsidiaries, and acquired in 1993 full control over two important Hong Kong companies in trading and shipping respectively. The president of Poly is a son-in-law of Deng Xiaoping, and another director is the son-in-law of Yang Shangkun, the former president of China (*FEER*, October 14, 1993, pp 64 ff).

"As foreign investment pours in, Chinese capital is flooding back out. Entrepreneurs and public sector managers seem in no hurry to repatriate offshore balances accumulated in the trade boom of past several years" (*FEER*, July 15, 1993, p 72). Other reports corroborate that China has accelerated the purchase of foreign assets, frequently paying above the market price. "Many Chinese companies are cash rich and can fund such acquisitions from their own working capital." Some like Sinochem and Sinopec have even bought real estate abroad (*FEER*, October 14, 1993, p 74). Prompted by the keen interest shown by the SEs in Hong Kong and New York, the Chinese companies are entering into the fray with a gusto. After all, the US alone has 50 million individual and 1,000 institutional investors (*FEER*, August 4, 1994, p 58).

Large amounts of hard currency funds are now at the disposal of Chinese firms which are set to acquire more. It is by no means clear how this will, if at all, be reflected in

China's BOP. Chinese firms can now raise funds abroad either on own account or through overseas subsidiaries. If these are not brought into China, and utilised, for instance, to expand the foreign asset base or promote China's export, these will not appear in the BOP at all. The funds would become inward FDI in the BOP if the proximate source was a firm incorporated abroad, e.g. a subsidiary in Hong Kong; or these may be shown as loans to the parent Chinese company, i.e. 'portfolio capital inflow'.

VII

Errors and Omissions in BOP

If all foreign exchange transactions are accurately recorded, then the sum of current account deficit (surplus) and of capital account surplus (deficit), inclusive of changes in Reserves, must equal zero. But this is too stringent a requirement; in practice, the sum is non-zero and is called 'errors and omissions' (E and O). Under 'normal' circumstances, E and O over a number of years ought to have opposite signs with a mean close to zero, analogous to the error term in regression analysis. So long as the E and O over a period is rather small in relation to the size of foreign exchange transactions, one can ignore it. An E and O of, say, \$ 5 billion, would be insignificant for the US, but not for a developing country. For many Latin American countries in the 1970s and 1980s the E and O was consistently negative and large, which was taken as an indication of capital flight.

In the case of China one reason why the E and O may not be negligible is that exports as well as imports are valued by the customs authorities on an f.o.b. basis, and not according to the payments and receipts recorded with the central bank. For instance, two sets of Indian official merchandise trade figures are available from the customs authorities and the Reserve Bank of India respectively. The difference is explained by leads and lags in physical shipments as against payments and receipts; some exporters may be fully reimbursed for the shipment only in the next accounting year, and similarly, some importers may have to make advance payment for consignment. Since in India's BOP only the Reserve Bank data on merchandise trade are incorporated, the size of E and O should not be affected by these leads and lags. Not so in China. Hence China should have a relatively larger E and O than India under 'normal' circumstances.

It is well nigh impossible to set a theoretical or *a priori* upper bound for E and O. One rule of thumb is to focus on the ratio of E and O to exports over a period, say, 3-5 years, and rule out 'abnormalities' when the ratio stays below a threshold, say, 2 per cent; if it is negative, and the absolute value exceeds 10 per cent, there is a strong

presumption that capital flight is taking place. Using these thresholds, one finds from Table 2A that China's E and O in \$ million ranged from 294 to -1,518 during 1982-89, rose steeply to -3,215 in 1990 and further to -8,211 in 1992. Over the sub-periods, the cumulative outflows in \$ million were 947 in 1982-84, 3,312 in 1985-89 and 18,183 in 1990-92, the corresponding percentages to total export being 1.4, 1.9 and 10.1, respectively. My tentative conclusion is that, except for an odd year or two, the relative magnitude of E and O was rather insignificant up to 1989, and the flight or export of capital through this route took serious proportions only since 1990.

What explains the extraordinary size of E and O in recent years? With rapidly expanding foreign exchange transactions, the statistical system which had never been too strong, may have been overstretched. This is not a sufficient explanation.

There is a strong presumption that corruption played a major role. According to the deputy Procurator, General Liang Guoqing, corruption "is now worse than at any other period since New China was founded in 1949. It has spread into the party and government administrations and every part of society." In 1992, the Chinese officials spent 17 billion yuan (\$ 2.95 billion) in travel and entertainment, according to the state-owned *China News Service*. In January-May 1993, state units spent over 14 billion yuan on vehicles alone. In the course of a much-publicised anti-corruption drive some 2,00,000 cases were sent for investigation in January-July 1993, yet few prosecutions took place (*FEER*, September 16, 1993, pp 16-17). Next, tax evasion by enterprises is rampant. By early 1993 some 300 tax consultants had entered the scene; shortly after China International Taxation Consulting was set up, some of China's leading companies became its clients, underlining the international dimensions of their activities. Authorities believe that unpaid taxes amounted to a colossal 100 billion yuan (\$ 17.3 billion) in 1992. According to one study, state enterprises did not pay half their dues, and the percentages were much higher at 60 and 80, respectively, for collective and private enterprises. 'High tax rate, many tax breaks, and light tax burden' - that is how an expert described the current system. While widely quoted official statistics indicate that 40-50 per cent of state enterprises are in the red, the actual story may be very different. The local authorities have the power to offer tax privileges, and they exercise it merrily since they are supposed to pass on their entire collection to Beijing. The enterprises in theory can retain no more than 10 per cent of their declared profits, which again encourages them to cheat. For instance, Shanghai Forever was declaring losses year after year, but

suddenly disclosed substantial profits just before listing at the Shanghai Stock Exchange. There was another firm which parked its earnings carefully in subsidiaries and went on expanding its businesses while the parent company's finances were in a poor shape (H Sender, *FEER*, November 25, 1993). The State Asset Management Bureau admitted that during the three years, 1991-93, 500 billion yuan (i.e., well over \$ 60 billion at the present exchange rate, or at least five times as much at the purchasing power parity of the two currencies) of state assets were channelled improperly into private hands (*FEER*, May 5, 1994, p 77). By comparison, India's stock exchange scam of 1992 pales into insignificance. No wonder that the moral fabric of Chinese society has been torn asunder. According to one report, the police is no more in control, mafias are spreading their wings, and the popular perception is, 'cops and robbers; they are of the same tribe'. The rich have their private security guards (*FEER*, June 6, 94, pp 22ff). Individuals with huge ill-gotten wealth must have taken a part of their capital abroad, reflected in high E and O.

But that may not be the whole story. Over 100 Chinese institutions were authorised to borrow abroad by 1993. They exercised it in such a hurry that a Japanese banker was reminded of Latin America in the early 1980s. The former also abused the funds so created (*FEER*, July 15, 1993, p 77). Moreover, state-owned enterprises may have also deferred the return flow of earnings abroad from export, etc, for a variety of reasons, including the accumulation of foreign assets. The picture, to say the least, is quite blurred.

VIII Capital Flight?

Capital flight from developing, especially the highly indebted countries, is a widely discussed topic. Although several Latin American countries have been in the limelight in this regard, it was by no means confined to that region. There has been speculation about China as well. The most startling was the allegation made in a Hong Kong newspaper, citing an internal document of the People's Bank of China, that 'mainland bankers had looted China of US \$28 billion' in 18 months till mid-1993. Sender (*FEER*, September 2, 1993, p 65) commented: "Given the amounts allegedly siphoned off, it was both hard to take it seriously - but harder still to dismiss."

F R Gunther of Lehigh University, US, conducted a study with support from the UN as well as China's ministry of foreign trade and economic co-operation on capital flight; his 'broad' estimates ranged \$15-25 billion in 1990 and \$13-28 billion in 1991; it should have risen in 1992 (cited by L Kaye, *FEER*, July 15, 1993, p 72). The range of the

estimates corresponds to two different measures of capital flight, of which one is followed by the World Bank and will be discussed shortly. A subsequent study by Gunther put capital flight at \$ 40 billion in 1993, "some of which may have roundtripped as part of the \$ 20 billion FDI into China" (*FEER*, March 1994).

The World Bank has estimated capital flight from as many as 84 countries outside the OECD. China comes at the very top with an annual outflow of about \$ 4.4 billion (read from a bar chart) between 1981 and 1991, followed by around \$ 3 billion each from Argentina, Mexico and Venezuela, etc [Claessens and Naude 1993]. The World Bank's 'residual' method defines capital flight as the difference between 'sources' and 'uses' of foreign funds. The former includes changes in the 'net external debt' (A) and net inflow of FDI and portfolio corporate equity (B). The 'uses' are BOP current account deficit (C) and increase in Reserves (D). While A is taken from *WDT*, the rest are from the IMF's BOP series; of the above items, B refers to IMF line numbers 45-52 and 59-61, and the others are self-evident.

Before looking at the numbers, it is well to bear in mind the underlying assumptions behind most capital flight estimates. These seek to measure the outflow of capital on private account from countries which do not permit free mobility of capital, and hence the outflows are either illegal or semi-legal. Further, the governments concerned, it is presumed, are not encouraging the accumulation of foreign assets since they lack foreign exchange to finance necessary imports; if this scarcity did not exist, the governments would not have piled up in the first place large external debts.

These premises are generally valid for Latin America, Africa or India, but are of doubtful relevance to China. True, there is massive corruption in that country and private individuals have misappropriated huge amounts of state-owned assets, some of which could have been siphoned off abroad. But large state enterprises also acquired enormous foreign assets, actively encouraged by the government; this can hardly be called capital flight.

Coming to the World Bank's estimate, there appears to be one serious flaw. In calculating the 'sources of funds', FDI inflows are treated as 'net' and hence cumulative; but that is not correct for China. The putative FDI stock, calculated from my

Table 2A, was \$ 22.6 billion at end-1991; the 'actual' or 'existing' stock, extrapolated from the Hong Kong report cited earlier, would fall short of \$ 6 billion. On this score alone the magnitude of 'capital flight' gets reduced by \$ 16 billion over the decade, and the average annual figure comes to \$ 2.8 billion during 1981-91.

Claessens and Naude further note that there are alternative methods to estimate capital flight, they have, however, shown that insofar as the former are derived from BOP statistics, these are methodologically equivalent to the World Bank's. Now, some authors have added leakages from 'misinvoicing' to the estimates of capital flight. 'Misinvoicing' is the difference between say, China's export to the 'world' (rather, 'rest of the world'), and the world's import from China, obtained by adding up imports by all trade partners of China; similarly, for China's import and the world's export. There is a uniform adjustment for 'c i f' and 'f o b', factors, and all data are taken from the IMF's *Direction of Trade Statistics*. In China's case, all of 'misinvoicing' may not indicate capital flight, since a part of it must be attributed to profit repatriation by foreign investors; another part may represent capital export encouraged by the state. But some 'misinvoicing' must have been on private account, i.e., a case of capital flight. There is no way disaggregating the total along these lines.

Finally, if there was, indeed, a massive capital flight, accompanied by a huge inflow of foreign loans and FDI, how does one explain the BOP statistics on investment income flows? The two-way income flows with respect to FDI, inward and outward, are practically nil. Regarding non-FDI investment incomes, receipts generally exceed payments, barring three years, 1986-88, when the deficit totalled a mere \$ 521 million. Over the whole period, 1982-92, there was a large surplus of \$4.7 billion; average annual gross receipts increased markedly in \$ billion from 1.5 in 1982-84 to 4.3 in 1990-92. To my knowledge, none of the Latin American countries exhibited these characteristics. Rather, China's situation is analogous to capital-exporting industrialised countries that tend to earn a growing surplus from investment income flows.

Thus I conclude that though there was some capital flight from China, the bulk of the outflow is better regarded as officially promoted capital export.

PART B: TRANSITIONAL ECONOMIC SYSTEM

IX Continuity and Change

In the west, the 'open door' policy has been hailed as an historical turning point; it enabled China to get out of the Maoist

straitjacket of an inward-looking, slow-moving, 'iron rice bowl' economy into a prosperous, forward-looking and dynamic one. This interpretation is rather dubious. The changes since Deng Xiaoping became the paramount leader at the end of 1978, are

truly breath-taking, but the continuities are hardly less remarkable. The celebration of Mao's centenary in contemporary China is not a charade performed by nostalgic non-agrarian patriarchs.

Was China stagnant during the cultural revolution years of 1965-75? At constant 1985 prices, the GNP in that decade increased at a compound rate of 6.9 per cent per annum which is high by any standard; its acceleration in 1980-92 to 9.1 per cent per annum was no doubt impressive. As for the value of export at current US dollars, it did stagnate at \$ 2.5-2.8 billion during 1965-71. After the visit of the US president Nixon to Beijing in early 1972, export surged by one-third in 1971-72; the compound annual growth rate from 1971 was 29 per cent till 1975, when the cultural revolution ended. The interregnum 1975-78, saw deceleration. From 1978 to 1992, the annual growth rate was an astonishing 16.1 per cent (calculated from *IFS Yearbook 1993*). Surely, export growth did not decelerate because the cultural revolution was abandoned; for any country it would be virtually impossible to sustain a growth rate of almost 30 per cent. Deng and his advisors have every reason to feel proud about their achievement. But the success of the earlier phase is also very striking, refuting the stagnationist view.

There is again a tendency to dub the 'open door policy' as just another name for the liberal prescription of 'export-led' or 'export-oriented' growth. That interpretation apparently holds when one examines just the ratio of export to GNP; with both variables measured at current prices and exchange rates, the ratio shot up more than three-fold from 6.1 per cent in 1980 to 18.5 per cent in 1992. However, this increase can be almost wholly attributed to the repeated devaluations from 1.50 yuan per \$ in 1980 to 5.51 in 1992 (*IFS Yearbook 1993*). This was far in excess of the differential rates of annual inflation over the same years, amounting to 6.5 per cent in China, and 4.3 per cent for all 'high income' countries that were the main trading partners. Recalculating China's GNP in current 1992 yuan, converted into dollars at the 1980 'real' exchange rate (i.e., the nominal 1980 rate adjusted for the higher inflation rate in 1980-92), yields an export/GNP ratio in 1992 of 6.8 per cent, or just a shade above that in 1980. In the same vein, Nayyar (1988, pp 96-98) had earlier shown that at the nominal 1980 exchange rate of the yuan the percentage share in 'national income' (net material product) fluctuated in the range, 4.6 to 6.1 for export, and 4.0 and 9.4 for import, during 1975-85. The upward trend was rather mild. Alternatively, if the GNP in 1992 were estimated at the 'purchasing power parity' of the yuan, the export/GNP ratio would be quite small at 3.8 per cent. A similar conclusion emerges if one looks at China's import which, in the long haul, equalled export. In 1980-92 the current dollar value

of import rose 9.2 per cent per annum; allowing for the inflation rate abroad, the volume of import should not have risen by more than 6 per cent per annum, which is much less than the 9.1 per cent per annum growth rate in 'real' GDP (computed from data in *WDR 1994*). Thus China's growth over these 'miracle' years was propelled primarily by domestic factors, and foreign trade played an extremely crucial supporting role.

By underlining the continuities in some respects, I do not deny that a great deal has, indeed, changed in Chinese society and economy since the days of Mao. The love for lucre has become all pervasive. In earlier sections evidence was collected to show the emergence of what contemporary Russians call 'savage' (*diku*) capitalism, or Marx called 'primitive accumulation'. These have no doubt brought cheer to the ideologues of private capitalism as the only viable form of social and economic organisation; however, China is still some distance from the liberals' idyll.

Not only that the Communist Party is still at the helm, but Deng and his followers have not deviated from one of the basic tenets of old-fashioned communists, namely 'national self-reliance'. Despite all their eagerness for growth and modernisation, the Chinese leaders have remained fiercely independent in the domains of economics, politics and defence, without succumbing to the dictates of the US, the world's sole surviving superpower. In foreign trade, a balance between export and import of goods is still a cardinal principle of policy. The same is true for capital flows. China encouraged the inflow of foreign goods and capital, not as a one-way traffic to modernise her economy (as was tried in the USSR under Brezhnev, Latin America, India, etc.), but only as a *quid pro quo*, simultaneously, the rich countries opened their markets to Chinese goods, and allowed Chinese firms to build up their foreign assets. By avoiding the 'dependency trap', she entered into a relationship, more rewarding and genuine, of interdependence with the rest of the world.

As for the domestic economy, China has abandoned the earlier over-centralised planning system, and embraced a new market philosophy, granting wide-ranging autonomy to enterprises, provinces, and local authorities. Yet, many strategic decisions are made by the central authorities in a flexible and highly effective manner; and the concept of the market is vastly different from that in western textbooks.

X Import Policy

In the matter of imports China, according to the US government, "maintains one of the most protectionist regimes in the world" (*FEER*, August 25, 1994, p 50). Innumerable barriers have been erected by central as well

as local authorities. A recent World Bank study found that "fully 50 per cent of imports [are] subject to some form of non-tariff barriers - licensing requirements, quotas and other types of quantitative controls". As one US trade negotiator put it, China has "a capitalist export regime with socialist import rules" (*FEER*, April 28, 1994). There is a good deal of truth in these assertions. Thus after several years of comfortable trade surplus, China ran into a big deficit of \$ 12.48 billion in 1993. Thanks to prompt corrective measures, viz. recentralisation of power to set prices, closure of futures markets, etc., the deficit was drastically reduced to \$ 0.8 billion during the first half of 1994; export shot up to \$ 48.4 billion (+30 per cent), while imports were pegged at \$ 49.2 billion (+21 per cent); the figures in parentheses are percentage changes over the same period in 1993. (*FEER*, September 1, 1994, p 47). So foreign trade is not left to the vagaries of 'free market forces'.

Import control did not mean that China was minimising import by pruning all 'inessentials'. Since the overall trade balance was maintained, over the years many consumer goods (along with capital goods) were imported in increasing quantities, while domestic production of import-intensive items was encouraged. Has China been foolish? Few will advocate that developing countries should run up large trade surpluses. But indiscriminate imports even over a short span of time. Nayyar (1988, p 111) feared, can easily turn the surplus into an uncontrollable deficit. Vaidyanathan (1988, pp 31-32) voiced the same misgiving. He was further worried about the employment-displacing effect of new technologies *vis-a-vis* traditional ones. In practice, the high labour-intensity of Chinese exports, and the rapid expansion of the home market for consumer goods should have mitigated, if not neutralised, the impact on employment of imported technologies. On the other hand, Vaidyanathan's concern about growing inequalities in post-reform China, strongly associated as both 'cause and effect of 'consumerism', requires a more careful examination.

Returning to the BOP aspect of consumer goods import, thanks to the import control China avoided the external debt-trap. On the other hand, in a period of rapidly rising export, unless the import bill is enlarged, the consequent trade surplus might invite retaliation from trading partners. Indeed, the ever increasing flow of import has greatly strengthened China's lobbying power in those countries and taken the wind out of the sails of critics clamouring for a cut in China's export; the opponents might be human rights activists denouncing the lack of personal freedoms in contemporary China and/or the use of low-cost prison labour in export production, spokesmen of industries unable to compete against imports of low

technology products like textiles, garments, toys, etc

Should China have imported more of capital goods in lieu of consumer goods? (a) True, the USSR under Brezhnev followed that path, increasing crude oil export in return for technology and machinery. Owing to numerous drawbacks in the overall planning system, Soviet industry was unable to assimilate, still less diffuse, the new technologies, and many imported machines were poorly utilised. The capital goods industries in a planned economy (or, indeed, anywhere) have a limited capacity to absorb foreign technology at any point of time, determined by the macro framework, the level of skills at the enterprise level, technology in use in related (forward or backward) enterprises, and so on. None of these can be changed radically overnight. Had China concentrated on the import of capital goods, it might in effect have crippled her own industries in these branches. If, on the other hand, machinery imports are well regulated within the limits of what the domestic industry can assimilate, the latter may emerge healthier in the long run. (b) There could also be a sound macroeconomic reason behind China's import of inessential consumer goods. The investment rate was consistently high in the 1980s at around 30 per cent or more, generating strong inflationary trends, and the import of consumer goods eased the pressure to some extent. If, instead, capital goods were imported in larger quantities, the inflation rate would have been higher, upsetting the already precarious balance between the disposable income of the population and the supply of consumer goods. (c) Technologically, import-substitution is far easier in most consumer goods industries. Whenever the governments were determined, many developing countries succeeded in this respect during the past decades. The GATT today presents an external obstacle to import-substitution policies. But that threat looms large over capital goods industries as well.

XI

Foreign Investments

One main thrust of the 'open door' policy was to attract foreign capital. For export-oriented FDI, there were hardly any restrictions; the Special Economic Zones, in particular, were created to promote such investment. Many other developing countries, including India, did the same, though China reaped greater benefits than most others. For FDI catering to the home market, China followed a case-by-case approach like other developing countries pursuing an import-substitution strategy. It is worth examining her policy in five sectors of special interest as much to transnationals as to China; transnationals from developed countries are often believed to have a

monopoly of know-how in all these areas. Two of the sectors belong to 'infrastructure', and the theme song of *WDR 1994* is about what the developing countries must do to attract transnationals in these areas. India's contrasting approach is also briefly described.

(a) *Power*. By 1992 China had attracted over \$ 10 billion into her power generating industry through international borrowing, i.e., 'loans to replenish the 1/3 shortage of manufacturing and investment capability in the existing energy establishment. It was announced that China welcomes foreign investors to construct or upgrade its power industry by way of joint equity and co-operative ventures, or other forms of investment.' And China hopes to add every year 15 000 MW of capacity, "doubling the scale of power production by the end of the century" (Song Jian, *Beijing Review*, August 22, 1994). Yet, China sets down the terms of entry. Thus in early 1994 China cancelled a contract worth \$ 180 million for a joint venture in which the foreign partner was to have a 30 per cent stake; the venture would take over some existing power plants in Shandong province, and also set up new units. Apparently, a daughter of Deng Xiaoping listened to Goldman Sachs's oral presentation before potential investors who were promised a 20 per cent rate of return (ROR). The central authorities in China objected both to the high foreign equity ratio, and ROR. Against a ceiling of 12 per cent imposed by Beijing, some large cities are actually offering just 10 per cent ROR. Moreover, local authorities have since 1993 been forbidden to provide guarantees to power projects. Yet Shandong officials are still offering guarantee 'on the private'. And Goldman Sachs did not withdraw from the scene, but repackaged the deal now worth \$ 2 billion to be raised from the capital markets in New York and Hong Kong (*FEER*, April 14, 1994, p 74). When China slapped a ceiling on ROR for all foreign-funded infrastructural projects, it annoyed greatly Gordon Wu, a big Hong Kong capitalist who has financed innumerable projects in Guangdong and maintains close links with provincial leaders. Wu has threatened to put no more funds into China's power sector (*The Economist*, August 6, 1994, p 57). Earlier, Wu's power projects used to be guaranteed by Guangdong International Trust and Investment Co (GITIC). 'China is no longer the favourite' for Wu who has been scouring for projects in Indonesia and elsewhere (*FEER*, April 14, 1994). Foreign capital will henceforth seek greener pastures, forsaking China, warns *The Economist* (August 27, 1994, p 49), oblivious of the persistent crisis faced by global suppliers of power generating equipment. For quite sometime they are looking above all to Africa to fill their order books (A. Baxter, *Financial Times*, April 7, 1993, p 5). As the *Business Week* (reproduced in *The Economic Times*,

August 21, 1994, p 8) reiterated, power demand will rise by just 1 per cent per year in North America in the next 25 years, power projects in the US earn a meagre 10-11 per cent ROR, and the main hope for the equipment suppliers lies in Asia followed by Latin America. Despite the stiffening of her stance, there is no dearth of foreign proposals to fund power projects.

Quite illuminating is an interview by the minister of power industry, Shi Dazhen (*Beijing Review*, November 21, 1994). (a) Out of 63 foreign funded projects with a capacity of 40 GW (1 GW = 1000 MW) since the open door policy was adopted, 31 projects with an aggregate capacity of 20 GW were operational by 1993, for the 63 projects, foreign funds totalled \$ 14.3 billion, of which 70 per cent came as loans from the World Bank and industrial countries. Current negotiations with the US cover projects with a capacity of 30 GW, and total investment of \$ 17 billion. (b) While welcoming foreign capital, China adheres 'to the principle that the grid system should be placed under unified state management and that sales of fixed assets are prohibited: the only financing areas open to foreign investors are operational aspects relating to the power industry. The foreign share in various strategic power plants is limited to 30 per cent. At the same time, we must comply with the fact that investors deserve profits. Therefore, the Chinese government encourages foreign businessmen to settle profits in terms of Renminbi, and foreign investors agreeing to do so should be granted preferential treatment in investments. China's social system determines that foreign investors are not required to [undertake] risks associated with operating private power plants in other countries. [C]onsidering the comparative advantages, officials from the World Bank say that China offers the best rate of return on investments in the power industry.' (c) China's installed capacity in GW increased from 1.85 in 1949 to over 100 in 1987 and 193 in 1993; against an annual average increase of a little below 12 in 1987-92, the figure for 1993 was 15, and the forecast is 15-17 in 1995-97, and 20 in 1998-2000. (d) As for technology, 'China has basically unified standards for domestically manufactured power generation equipment... [and can] independently undertake the construction of large power projects with an installed capacity ranging from 2 million to 3 million KW, as well as various types of hydropower stations, large dams reservoirs.' The Chinese engineers have built 31 power stations, each with a capacity of 1000 MW. Among those under construction is the Three Gorges Hydropower Station with a capacity of 18,200 MW.

One may draw the following inferences. (1) Assuming that all foreign-funded projects materialised after 1987, their contribution to the overall increase in installed capacity

during 1987-93 was just 22 per cent. It may go up somewhat in the remaining years of this century, but not by very much. (ii) Foreign capital and technology imports do not replace, but supplement, domestic resources in a period of heady growth. While ensuring adequate returns for foreign investors, the Chinese government has so far retained control over the power sector.

The contrast with India is striking. Our public sector firm, BHEL, which has installed about two-thirds of the existing power plants in the country, can annually produce equipment with a capacity of 6,000-7,000 MW; this is well in excess of the current official target of 20,000 MW of fresh capacity up to 1997. Further, BHEL has won 28 out of 31 contracts against global tenders within and outside the country in the past 10-15 years; no transnational has so far matched this record. Pleading a severe fiscal crunch, the Indian government has virtually offered a *carte blanche* to transnationals. But they will bring in only 40 per cent of the project funds, choose their equipment and raw materials (domestic or foreign) without a tender, set power price at twice the present generating costs in the country, and enjoy guaranteed offtake of whatever they can supply and timely payment in foreign exchange, including a minimum of 16 per cent post-tax ROR. These agreements will not only cripple BHEL and lead to a massive haemorrhage of foreign exchange, but also impoverish the public sector power generating authorities that may be obliged to shut down, in case of excess supply, their low-cost plants to fulfil the terms of the contract (NWGPS 1994). Moreover, very little has been done to improve the management of existing power plants which often run at 30-50 per cent of the rated capacity, although actual experience at several sites showed a 100 per cent improvement without the induction of new technology or investment. Nor any serious effort is under way to encourage more efficient use of power by consumers, individuals or firms, that could cut back demand significantly. Lastly, rural power consumers, accounting for a significant part of the total, are heavily subsidised eroding the finances of the public sectors; only now remedial measures are being considered (Kapoor 1994).

(b) *Telecommunications*. China, to the best of my knowledge, does not possess technology comparable to that of India's C-DoT (Centre for the Development of Telematics). Hence 'foreign investment was welcome in telecom equipment, research and education', according to Wu Jiachuan, the minister concerned. The plan envisages over 10 million new telephone lines a year with the stock (in million) increasing from 30 in 1992 to 42 in 1993 (actual) and 140 by 2004. Cumulative foreign investments that stood at \$ 5.7 billion till 1993, will rise

by another \$ 7 billion till 2000. Yet there is 'a ban on direct management or equity ownership of services by foreigners, a policy that reflects national security concerns and - some analysts say - the ministry's strong interest in protecting its lucrative monopoly.' China's overall investment in telecom fixed assets during 1993 was \$ 4.7 billion, while the 1994 budget has gone up to \$ 6.2 billion. (Reuter report in *The Economic Times*, June 22, 1994, p 2) Once again, foreign capital is called upon to supplement, and not replace, domestic resources.

Quite unorthodox in this context is the creation in 1994 of China United Telecommunications Corp (Unicom), backed by the ministries of power industry, electronics industry and railways; the army is still hesitant (for security reasons) about the venture which will break the monopoly of the ministry of posts and telecommunications. Unicom is registered with a capital of about \$ 116 million, including \$ 9.3 million each from the six biggest state-owned companies like CITIC, China Resources Co., China National Chemicals Import and Export Corp, China National Technology Import and Export Corp, etc, which have all extensive foreign assets. Unicom plans to spend \$ 12.5 billion till the end of the century, when it should handle 10 per cent of long-distance calls and 30 per cent of mobile telephone services (Reuter report in *The Economic Times*, July 21, 1994). *The Economist* (August 27, 1994) is hopeful that thanks to Unicom, the present ban on foreign-owned telecom services will be lifted. There is so far no indication of such a policy change.

On the other hand, the Unicom example is very interesting from a theoretical perspective. Although diehard liberals may dismiss it as an instance of spurious, state-managed competition, it resembles strongly state-sponsored rivalry among the giant private conglomerates in post-war Japan which were shielded till recently against foreign competition. One wonders whether the Chinese leaders took a leaf out of Bukharin's writings of the 1920s that were published and seriously discussed in China during the last decade; nearly 70 years ago the Bolshevik leader warned against the 'parasitic' state monopolies in the USSR and sought to promote competition among autonomous socialist enterprises (Chandra 1992).

What is the Indian scenario? Set up in the mid-1980s, the C-DoT designed from the scratch and commercialised within a few years digital electronic switching systems through a large network of domestic licensees. The systems are both 'state of the art' and cheaper than those of the established transnationals. By now over 3 million telephone lines in the country are connected to C-DoT systems, and the annual capacity of the equipment manufacturers exceeds 2

million lines. Owing to the post-1991 liberalisation, transnationals have already set up manufacturing facilities with an annual capacity of 0.5 million lines, pre-empting about half the aggregate market, averaging 1.1 million lines in the past two years to March 1994. Even if actual demand were to reach 2.2 in 1996-97 as the revised official forecast claims, the entire demand could have been met by the C-DoT licensees. Moreover, the government is blindly pursuing the Anglo-American pattern of deregulation, enabling domestic as well as foreign private companies to operate basic telephonic as well as value-added services (Meemamsi 1994, Purkayastha 1994). It goes without saying that few private operators, if any, will opt for indigenous technology, sounding the deathknell of an industry which was among the most conspicuous success stories of hitech industry anywhere in the developing world.

(c) *Civilian aircraft*. China has very little manufacturing capability in this domain, and has bought planes from the ex-USSR as well as western firms. She already possesses 150 Boeings, 15 Airbuses, and 39 MDs (McDonnell Douglas). Since her future requirements are even greater and taking advantage of the recession in the global market for aircraft, China has been negotiating co-production arrangements with various suppliers. While Boeing and Airbus have so far agreed to set up only flight simulators to train pilots (*FEER*, August 25, 1994, p 42), MD has gone further. Shanghai Air Industry Group will manufacture in a joint venture with MD, 20 units of 150-seat commuter planes with advanced avionics. The US company will: provide information on aircraft design, parts and components, aircraft systems, engines and raw materials, send experts to China; and assist them in the domestic production of fuselages (*Beijing Review*, August 8, 1994). The Chinese strategy is a variant of the 'phased manufacturing programme' (PMP) much maligned by liberal orthodoxy today. Strangely, no Indian government, not to speak of the present one, ever gave a thought to it, although the two public sector carriers have a fairly large fleet between them.

(d) *Automobiles*. Here again China did not possess modern technology, but the supply had to be enhanced to 'provide material incentives' in the new post-1978 context. From social considerations of equity or environment, one may question the desirability of encouraging the use of private cars, but one must admit that the policy did not upset the trade balance. A large number of imported fuel-efficient cars was probably better than a duplication of the existing manufacturing plants with outdated technology. On the other hand, a big country cannot depend entirely on the import of automobiles. Besides, the overseas market for China's main exports today (textiles, etc)

is reaching saturation point and is further constrained by the slow rise in income levels in the OECD countries. Hence China adopted the PMP route for joint ventures in the automobile sector in order to maintain the trade balance in the long run. And FDI in the sector has been carefully regulated so that "only those who undertake to help China develop its own auto industry will be allowed to enter the Chinese market, and the technologies they bring in must be of an internationally advanced level. China's long-term target is to cultivate a number of large motor groups with the capability of design, manufacturing and assembling" (*Beijing Review*, August 2, 1994, p 5; *The Economist*, September 10, 1994, p 81). In the immediate future China is focusing on the auto parts, presumably with a view to exporting in large quantities. At this moment no fresh investment proposals from foreigners are entertained, though the ban may be lifted at the end of 1995.

(c) *Chemicals* A report in *The Economist* (September 24, 1994, p 71, reproduced in *The Economic Times*, October 10, 1994, p 21) is worth quoting at some length. It began "WANTED \$ 10 billion of investment and technology." That was the begging message sent by the Chinese government to 300 or so representatives of the world's chemical industry who attended a government approved conference organised by *Chemical Week*, a [US-based] trade paper, in Beijing recently. "Although the chemical industry is the fourth largest in China, it is 'still a tiddler, accounting for a mere 3 per cent of world production'. It is 'so inefficient', the firms are 'overstaffed by 50 per cent, but cannot lay people off'. Despite a low per capita consumption of plastics at 5 per cent of the American level, 'China imports half of its plastics'. In 1993 it spent \$ 11.2 billion of precious foreign currency importing chemicals." Though China 'wants...to invest in new plant and equipment, and become an exporter', the industry has no money, and 'everybody agrees that most companies are making losses'. And the 'industry has a growing environmental problem'. There are 1554 joint ventures in the industry, the average foreign investment being near \$ 10 million. 'Few make money. So far the foreigners have shied clear of government's plan to build six big petrochemical complexes, worth up to \$ 2 billion a piece, by 1997. Foreigners have several criticisms of the government - it has a cavalier attitude towards intellectual-property rights (although it is now cracking down on private firms); it prevents foreign firms from recruiting their own staff; and it levies heavy taxes if they try to take profits out of the country. Moreover, although it is beggar, China can be choosy about the type of investment it welcomes. It recently postponed approving any new joint venture oil refineries until 1995 partly to protect

Sinopec, whose refineries have been losing market share.' Bureaucracy is a major problem for foreigners; W.R. Grace moaned that it took them 15 years 'to progress from negotiations about building a plant to starting production. China is trying to mend its ways. It also looks as if China may, for a while, waive its stipulation that new investors must export'. Foreigners 'still have two fundamental objections. First, the fragmented Chinese chemical industry needs to consolidate before it is worth building new plants. And, second, world's chemical industry is already oversupplied. Firms in western and Japanese chemical markets are just breaking even; new capacity from an exporting China could force them back into losses. Capitalism, as Beijing is discovering, is not an altruistic affair'.

The Economist's litany of grievances should ring a bell familiar to Indian readers. But the report is a curious mixture of facts and wishful thinking. At least one 'fact', namely, that few chemical joint ventures in China make money, is patently false. Had it been true, inflows would have dried up long ago, and global companies would not have thronged the Beijing conference! However much *The Economist* might wish, China never approached the west or Japan with a hat in hand like Gorbachev or Yeltsin, India and other developing countries. World's chemical giants went to Beijing, not to dispense aims, but to seek a respite from the prolonged recession marked by a surfeit of capacity and squeeze on profits. There is no better place for them to go than China, the most powerful engine of growth in the contemporary world with no signs of an impending foreign exchange crisis. The Chinese have no reason to be enchanted by the siren songs of liberals who have managed to mess up nearly every economy that they could thanks to the IMF-World Bank duo; on all counts, China's performance is miles superior.

On the other hand, *The Economist's* apprehension that China may eventually become a net exporter of chemicals after the infusion of western capital and technology, and thus precipitate a gale of (creative?) destruction shaking out some of today's giants, is genuine. China is just trailing the Japanese path. By fencing her home market most assiduously, Japan took advantage of the intense rivalry among western transnationals and obtained technology against payments with practically no restrictions on export. Why are the western and Japanese firms not wiser today? The answer lies in the fact that all transnational firms are heavily dependent on the respective nation states and cannot form global cartels so long as there is a bitter struggle for economic supremacy among the triad of US, Europe and Japan. China's (and earlier, Japan's) international economic strategy is based on this understanding of global

capitalism, formulated in its essence by the American Marxists, Sweezy and Magdoff over 25 years ago.

China's approach to inward FDI may now be summarised: (i) In no case was domestic capability sacrificed to induct foreign technology and capital goods; rather FDI was called in to supplement domestic resources. (ii) In all hitech areas foreigners were required to have joint ventures, usually with state-owned enterprises which were either majority, or at least co-equal, partners. Incidentally, India's Foreign Exchange and Regulation Act, 1973, allowed 100 per cent foreign ownership in hitech sectors, but failed to attract any such FDI. (iii) Foreign firms are generally expected to have a balanced trade, profit repatriation has been linked to foreign exchange earnings. (iv) In the long run, the country hopes to export substantial quantities of value added hi-tech products through joint ventures or own enterprises. Far from being a toothless supplicant, China has set the entry terms for FDI, taking advantage of the huge size of her domestic market expanding at a spectacular rate, and the intense rivalry among global giants in a period of very sluggish demand growth in OECD countries.

XII

Local Enterprises and Planning

A unique feature of the Chinese economy is the institution of 'collective' enterprises. Owned neither by the state nor by private individuals, their juridical status is ill-defined. While post-tax profits of a state or private unit goes respectively to the state or the individual, "this residual ownership right resides with the [collective] enterprise itself" (Rawski 1993, p 1.). According to another legal expert (Lichtenstein 1994, pp 8-9), in urban collective enterprises, "ownership rights...[are] exercised by the workers' assembly, which selects the enterprise management". In rural collective enterprises, "the proprietary rights [are] exercised by the peasants' congress or collective economic organisation representing all peasants". Further, the latter retains 60 per cent of their after-tax profits, the remainder being utilised for "agricultural infrastructure and renewal and development of other enterprises". The autonomy of the collective enterprise is highly circumscribed by the local authorities, urban or rural. The significance of these enterprises is underlined by their spectacular growth since 1980, particularly in the rural areas. Industry as a whole increased its output at a compound rate of 12.6 per cent per year during 1980-90 when rural or 'township and village enterprises' (TVE) expanded twice as fast by 25.7 per cent per year, increasing their share in the national total from 10.4 to 31.8 per cent. (Field 1992.) Without venturing any counter-estimate, Rawski (1993) has produced sufficient evidence that

there is an upward bias in these measures of industrial growth, affecting both large state units and TVEs. Most recently, the State Statistical Bureau has used sample surveys and other statistical tools to knock off as much as 160 billion yuan from the 1993 output of industry, which amounts to over 11 per cent of the total for industry, or more than 5 per cent of the GDP (*Beijing Review*, April 11, 1994, p 21, and April 18, 1994, p 12.) Even then it is doubtful if the long-run growth rate would be drastically reduced for industry as a whole, and the TVEs in particular. These industries have also a most creditable record in export, their contribution in \$ billion jumped from 3.9 in 1985 to 12.5 in 1990 (Lardy 1992, p 711), accounting for 15.5 per cent and 24.3 per cent respectively of the national total. *Ipsso facto* such establishments can hardly be called inefficient as many tend to, inside and outside China

The overwhelming bulk of TVEs belong to the 'collective' sector. These enterprises do operate through the market. The central planners do not directly allocate raw materials to them nor determine their outputs. Indeed, the number of centrally allocated industrial goods, according to a World Bank study, fell drastically from 123 to 66 during 1980-86. Further, greater funds at lower levels and weaker central control, according to a World Bank publication, "have created a foundation for the establishment of local protective quasi-planning systems. These systems provide benefits for enterprises, particularly those established by community governments, so that they can be counted on to turn over taxes, fees, and profits. In a sense a quasi-planning system operates like a traditional planning system: it tries to infiltrate into every link in the operations of the enterprise, from personnel, finances, and materials to production, supply and marketing. But community governments can no longer impose inflexible administrative restraints on enterprises, for, the extent to which they can control or support them is limited by their own capacities" (Byrd and Qinsong 1990, pp 397-98). The same authors (pp 87-91) further observed that: (a) most TVEs of a "substantial size are owned and controlled by community governments at township and village levels"; the governments play a "critical role in strategic decision-making... [like the] headquarters of multinational corporations"; (b) the TVEs have "very strong local roots" and cannot be relocated; and (c) the TVEs do not have any "captive markets"

The *modus operandi* of TVEs is far from transparent, to say the least; it does not fit into the straitjacket of a Soviet-type 'command economy' or of a 'free market'. From the account of Byrd and Qinsong, it appears that the TVEs 'benefit from the local protective systems', without enjoying a captive market. Indeed, they also make a

significant contribution on the export front. This combination of local planning and exposure to market forces, from the local to the international plane, has again few parallels elsewhere.

If the success of rural industries is most glittering today, the idea of self-reliance at the local level was one of the most original Maoist ideas shaped during the Yenan days, and recurred through the years of the Great Leap Forward and the Cultural Revolution (Schran 1975). In the early 1970s, if an area was self-sufficient in raw materials, it would be subject to local, rather than central planning and allocation. Provinces sometimes built factories, disrupting production elsewhere. There is the dramatic case of the Chekiang provincial leader who refused to send raw materials to Shanghai, declaring that "Chekiang is not a colony of Shanghai" (Lardy 1978, p 151.) In the pre-Reform years of 1970-78, the value of output at constant 1970 prices output of brigade and commune industries witnessed a 6-fold rise from 6.4 to 39.0 billion yuan (Ronas 1992, p 21)

The observations of Fei Hsiao Tung (1986, pp 35, 123 and 150-52), an eminent social scientist who made many field trips to rural and semi-urban areas of Jiangsu province from the 1930s to the early 1980s, are quite instructive. By 1966 there were only 280 rural industrial units in Yancheng Municipality in the northern region of the province, and the real take-off can be dated to the mid-1970s. In the town of Xinta, Wujiang County, bordering the suburbs of Shanghai, except for one oil pump factory going back to 1958, all others were post-1975. But in the central region which is industrially more advanced than the north, the first generation of 'simple' industries were set up in the late 1950s, and 'laid the foundation for the later generation' of modern, science and technology-oriented enterprises. Although there was a 'general dissolution' in 1960, the early enthusiasts kept many of the units alive. The second period of development was in the early 1970s, and 'liberated development' began after 1978.

Almost as a corollary to the growth of TVEs, the central government revenues failed to keep pace with the growth of the economy. If in 1979 total revenue amounted to 27.7 per cent of the GNP, it fell to 18.3 per cent in 1991 and 17.5 per cent in 1992 (*IFS Yearbook* 1993). While I have no aggregate data on local authorities' finances, Byrd and Qinsong (1990, p 396) mentioned one city that obtained as much as 71 per cent of its extra-budgetary revenue from local enterprises and administrative departments.

Indeed, planning in China was never quite as centralised as in the USSR. Local governments allocated in 1980 as much as 42 per cent of steel, 46 per cent of coal, 36 per cent of non-ferrous metals, etc. 'The

Chinese system', according to a World Bank economist, Tidrick (1987, p 176), "is an amalgam of hierarchical planning, cellular planning, and markets." It would be one-sided to emphasise the 'cellular' aspect, as Donnithorne (1972) tended to: the Chinese never wanted to set up a 'cellular' economy with each 'cell' growing mainly on its own like 'an independent kingdom' (Chandra 1988, pp 124-29). I have already given several examples on how the central government has been intervening in a decisive manner in areas of 'truly national' importance, and withdrew from those where central co-ordination is not necessary. Guangdong's vice-governor was asked by a visiting US diplomat earlier this year: 'How much control does Beijing have on Guangdong's plans?' The reply was categorical, "None whatsoever" (*FEER*, February 17, 1994, p 45). I believe that the vice-governor may have boasted a little. After all, joint ventures in Guangdong's power sector had to be revised drastically at Beijing's behest

XIII

Central Planning and State Enterprises

As the market forces were increasingly activated, the nature of central planning underwent a major transformation. Those for whom the plan and the market are necessarily antithetical to each other, would conclude that the edifice of planning has all but crumbled in China. But that would be rather simplistic. A good part of the traditional planning system remains very much in place.

First and foremost, the industrial scene is dominated by the state-owned enterprises (SOEs). While commending the extremely rapid, 210-fold expansion (since 1978) in private sector employment to 29.39 million in 1993, the *Beijing Review* (June 20, 1994, p 20) added, "As an increasingly important component of the national economy, private economic establishments, at present, are *only a supplement* to the publicly-owned economy which continues to be the leading factor dominating the lifeline of the overall national economy (emphasis added)." Despite the relatively slower growth, the SOEs still account for about two-thirds of the industrial output, the ratio being even higher in heavy and capital goods industries.

Next, the lion's share of national investments are still flowing into the SOEs. Out of an aggregate fixed investment of 1,183 billion yuan in 1993 for the whole economy, the SOEs and state-owned institutions got 465 billion in fresh investment and another 219 billion for updating technology. The 1994 budget envisages a total investment in the economy of 1,300 billion yuan, including 875 billion yuan for the former, leaving 425 billion for collective enterprises and institutions as well as the private sector (*Beijing Review*, April 11,

1993, pp 22-23). Planning, above all, is about investment; the huge share of the SOEs implies a corresponding role for the planners, unless the SOEs are all autonomous and engaged in 'atomistic competition' between themselves.

Further, the central planners continue to allocate directly a large part of the key raw materials and machinery produced by the SOEs. It is true that production quotas are no longer fixed in a rigid manner. Singh et al (1994) write: "the SOEs also benefited by fixing or reducing production quotas, and freely expanding and disposing of above-quota output. During the 1980s, governments at all levels devolved decision rights, risks and rewards to both state enterprises and TVEs. A recent World Bank survey [found] A plurality of TVE firms were authorised to make decisions in eight out of the 11 areas covered by the survey without consulting the supervisory government agencies. State firms typically enjoyed autonomy in only five of eleven areas. Lacking a formal system of laws, regulations and enforcement proceedings, non-state enterprises often find themselves vulnerable to the caprice of officials, while state enterprises use close links to the government to protect, and where possible, enlarge their turf. Evidently, central planners have a considerable say over the SOEs."

It also follows from the passage just cited that there prevails a plurality of prices for a number of critical goods, the quota output is sold at a lower, state-determined price, while the excess fetches a higher value in the market. In short, the 'law of one price for one commodity', the hallmark of a market-driven or of a Soviet-type overcentralised economy, does not apply to China. The system is not unlike that in Soviet agriculture, once the kolkhoznik fulfilled his work obligation at the kolkhoz, he could devote his spare time to the private plot and sell the products at the kolkhoz market at prices well above those in state shops.

There is a big question mark over the future of SOEs. Officially, some 40 per cent of these enterprises in 1993 were in the red (*Beijing Review*, May 2, 1994, p 5). Elsewhere, even higher percentages are mentioned. However, many of the losing concerns, as noted earlier, may not have lost their financial muscle, having tucked away resources in affiliates and subsidiaries.

In the north-eastern province of Heilongjiang, according to the *Business Week* (reproduced in *The Economic Times*, August 1, 1994, p 9), some 2 million workers lost their jobs in 1993, while in March 1994 about 1,00,000 workers took to the streets protesting against pay cuts; and Han Dongfang, a Chinese labour activist exiled in Hong Kong, claimed that 50 million workers were on the verge of unemployment. If that were true, the workforce in the SOEs would be reduced by about one-half, which

is close to the percentage of loss-making concerns. Had the bankruptcy law discussed in earnest since 1986, were enforced, there would no doubt be a massive retrenchment. But the same report regretted: "the government is backing off from ambitious plans to cut subsidies as it would have caused more job losses". Similarly, moves to privatise unprofitable state enterprises have been "stalled because of government fears that too many state assets will flow into foreign hands". Predictably, *The Economist* (August 27, 1994, p 49) is equally unhappy. "Often unprofitable, always unwieldy, China's big state firms cannot be restructured without foreign help." It rules that "China has tried to limit foreign influence. As officials are keen to protect 'strategic' industries, foreign ownership of companies listed in the mainland" will not exceed 35 per cent.

On the whole I would discount fears of a massive closure or privatisation of the SOEs in the foreseeable future. Undoubtedly, the Chinese economic system is in transition. The ideological commitment to preserve state ownership over the means of production as the 'essence of socialism' or eschew private ownership, may have disappeared; but there is still a strong will to restrict foreign ownership. Once private capital acquires more clout, the SOE managers gain more autonomy, the regional leaders nibble away at central control, and so on, conditions would be ripe for the system itself to be transformed. Not being a crystal gazer, I refrain from further speculation on whether or when such transformation will take place.

XIV The GATT

What is China's stand on the GATT? Beginning with a brief examination of the present agreement, I seek to show how it is at variance with China's plan-market regime, ending in a speculative note about the issues involved.

The GATT Final Act of December 1993 (henceforth just 'GATT'), has several features inimical to developing countries committed to the traditional import-substitution strategy of industrialisation; in most cases there are special provisions allowing them to remove the protective barriers gradually by the year 2005, at a slower pace than for developed countries. The single-most important benefit for the former group would be the abolition of the Multifibres Arrangement (MFA) under which the rich countries have been protecting their textiles and garments industries, by fixing import quotas for developing countries; but these benefits, too, would be staggered, and the last 50 per cent of the barriers will disappear only in the final year of 2005. I wish to focus on the GATT system after 2005, setting aside the transitional

issues. Briefly, the long-run disadvantages for developing countries are as follows.

(a) So far only the developing countries, but not the developed ones, could impose high tariffs and quantitative restrictions on the import of manufactures, if it was thought necessary to promote specific industries, or for a number of other reasons. Now they cannot do so. A developing country firm must from its inception be internationally competitive, or else it cannot come up at all. If one looks at the current industrial scene in China, south Korea, India, Brazil or even Japan, it is doubtful if more than a handful of branches in the heavy and capital goods sectors of China, India or Japan would ever come into being had the present GATT been in force from 1950.

(b) Government subsidies will be severely limited for agriculture, manufacturing or industrial R and D. Many developing countries in the previous decades subsidised the key industries heavily in the initial phase, this would no more be possible. On industrial R and D, giant firms in the rich countries can afford to spend far larger sums of R and D than their counterparts in developing countries. Moreover, in many critical areas, R and D financed through the defence budget (outside the scope of the GATT) are actually carried out by private firms, very often there is a civilian spin-off adding to their competitive advantage. Most new, R and D-intensive sectors will thus be monopolised by the developed countries.

(c) Free trade in agriculture should equalise prices across the countries, it will be reinforced by the requirement that each country must import at least 5 per cent of its domestic demand for these products. Many developing countries were so far able to industrialise by keeping agricultural prices lower than in the world market, thereby enhancing the profitability of domestic manufacturing, it also helped them to export higher value added manufactures rather than agricultural raw materials. Hence, the GATT may lead to a relocation of some agro-based industries from developing to developed countries. Lest this appears far-fetched, let me cite the case of steel exports by Japan and south Korea, both importing iron ore as well as fuel from far-flung sources. By the year 2005 when the MFA expires, technical progress in textile machinery and microelectronics may make developed countries competitive in the production of textiles and garments.

(d) Under the GATT no country discriminate between domestic and foreign-owned enterprises, impose a ceiling on foreign equity stake in a firm, enforce a phased manufacturing programme (PMP), or require foreign firms to balance their foreign exchange inflows and outflows. China, India, South Korea and others used these methods to foster the growth of local firms; and Japan until recently had practically shut out all

foreign firms. Unrestrained freedom for transnationals will adversely affect domestic firms in a wide spectrum of industries with large economies of scale in manufacturing (e.g. chemical processing, cars and computers), advertising, or access to finance (as in soaps/detergents, cigarettes, packaged tea or coffee or other agrofoods, healthcare products, pharmaceuticals). As Soburo Okita remarked during a visit to India in 1992, there would be no Toyota or Nissan if transnationals had a free run in Japan from 1950.

(e) So far the intellectual property rights (IPR) on patenting, copyright, and so forth, were established by each nation separately. Over the last 20 years the system of IPR has been gradually harmonised between the rich countries, though the developing countries generally maintained their own systems. In particular, patenting of pharmaceutical and food products, fertilisers, pesticides and agricultural seeds could not be patented; in India, for instance, only the particular processes were given patent protection. The GATT basically follows the American model of IPR, which is likely to raise consumer prices and dampen the growth of developing country firms in a number of critical sectors. (f) Services, too, have come under the GATT for the first time. Banks, insurance companies, etc. will freely move from one country to another. In view of the large advantages of scale in these areas, there is distinct possibility of developing country firms, public or private, being swamped by the global leaders. This, in turn, will reduce the monetary and financial independence of developing country authorities, leveraged buyout of local firms by global grants in manufacturing may be accelerated.

On all these points, the contemporary economic regime in China is in flagrant contradiction with the GATT articles. One may recall that besides the politics of the cold war, the basic incompatibility between the centrally planned and the market economies was put forward as a key argument to keep the Soviet-type economies out of the GATT. And China still remains a half-way house. To fulfill the GATT requirements, China will have to: (i) forego import control; (ii) stop subventions, overt or covert, to the SOEs as well as sectoral R and D institutions; (iii) scrap the system of centralised allocation of scarce materials to the SOEs, which leads to a multiplicity of prices for the same good; (iv) give up state control over prices of agricultural and industrial commodities, so that the relative prices in China move closer to international levels; (v) dismantle the local planning system, leaving the TVEs at the mercy of global market forces without any local protection; (vi) remove all obstacles against foreign investment in different sectors of manufacturing and services, and (vi) enforce the new IPR regime.

The Chinese leaders cannot be enthusiastic about *The GATT Final Act*, 1993, but had no voice in its drafting. As Taiwan was thrown out of the GATT, China has been assiduously trying to re-enter the GATT since 1986. The US has now been authorised to conduct negotiations with China on behalf of the rest of the GATT signatories, and is dragging her feet over it. China, too, has been setting her own conditions.

While the German Chancellor Kohl, according to the *Beijing Review* (July 18, 1994, p. 4), "pledged all-out support" for China's entry into the GATT during Premier Li Peng's visit to Germany, Li Peng declared on the German TV. "One of the major preconditions which will enable Germany to tap the full potential of the Chinese market is that [Germany] expands imports of Chinese products." Another Chinese minister stated that China wants to be treated as a developing country in the GATT, although "it cannot be ruled out that China will carry out some duties reserved for developed countries." On the foreign trade regime, the minister admitted that China is shifting from an administrative to a legal system. Significantly, she added: "Regulations help the GATT contracting parties to understand China" (*Beijing Review*, May 23, 1994, pp. 5-6). As *The Economist* (August 6, 1994) rightly noted, China's desire for a developing country status is to gain a longer breathing space before adapting her rules on foreign investment, IPR, etc. Further, in 1992 GATT members agreed to readmit China letting in Taiwan.

The officials from the US which suffered a trade deficit of \$ 23 billion with China in 1993, bemoan the fact that China has not even published her import quotas for manufactures, further, the customs regime is strange – there are different rules in force at different ports (*The Economist*, August 6, 1994). The spate of US-inspired studies on misinvoicing in China's foreign trade is meant to prove that the country has been enjoying a larger trade surplus than reported in its customs data; this would strengthen the case for declaring China as a developed country.

On at least one point, namely, the IPR, China has been repeatedly telling the world that she is honestly implementing the provisions (*Beijing Review*, June 20, 1994, p. 8ff). Thus a Chinese firm selling fake Ray-ban glasses was fined 3,00,000 yuan and had its goods and equipment worth 5,40,000 yuan seized by the authorities (*Beijing Review*, July 11, 1994, p. 16). On the other hand, after two years of legal battle, a Chinese court fined a Shenzhen company just \$ 250 in December 1993 for pirating Microsoft software; the amount was later enhanced to \$ 2,500 (*FEER*, May 19, 1994, p. 55). According to the International Intellectual Property Alliance, Washington, American

firms estimated their overall loss in 1993 from 'piracy' at \$ 800 million, including \$ 322 million due to software alone, from China. The corresponding figure in \$ million for other countries were: 952 and 854 from Japan, 423 and 371 from South Korea, 192 and 95 from Indonesia, 191 and 81 from India, 155 and 38 from Thailand, 150 and 106 from Taiwan, and so on. Japan's total excludes the loss from piracy of 'records and music' for which no data are available (*FEER*, May 19, 1994, p. 55).

This last piece of 'evidence' is quite revealing. Apparently, Japan, South Korea and China are by far the worse offenders, and yet none of these countries were vocal opponents of the IPR. Japan, in particular, has been widely accused of excessive protectionism to minimise import of manufactures, which led to mammoth trade surpluses over the years, especially against the US. More than one US president have threatened to retaliate, and did obtain significant concessions by way of 'targeted imports' (in violation of GATT principles) of US manufacturers. Yet the problem persists. For, the US has lost her economic hegemony, and a full-scale trade war with Japan may cost her dearly.

The same applies *mutatis mutandis* to China. What makes China so different from other developing countries, is the sheer size of the economy and its impressive growth in GDP and foreign trade. She has emerged as a major importer of goods worth \$ 100 billion in 1993. During 1992 and 1993 China's import rose by over 25 per cent per annum, and an increasing proportion of the total came from the Pacific region. "*China has become the principal engine of growth*" in the Asia-Pacific region, according to *Pacific Economic Outlook*, a report for the inter-governmental Pacific Economic Co-operation Council (better known as APEC) for 1994 (*FEER*, June 23, 1994, p. 59; emphasis added). The leaders of G-7 countries are making a bee-line to Beijing in search of multi-billion-dollar contracts. In the US alone, several hundred thousand skilled jobs in hi-tech areas apparently depend on Chinese orders. After a great deal of noise about human rights in China, president Clinton was compelled to renew the MFN treaty with China in mid-1994. Above all, the OECD is going through its worst ever economic crisis with stagnating GNP and massive unemployment. They are just incapable of pressurising the Chinese leaders to adopt the GATT system at a faster pace than the latter are wont to.

Nor is it clear that the west really wants China to hasten greatly the pace of adjustment. Notwithstanding the self-righteousness of the mandarins at the World Bank and the IMF, 'the big bang' approach to transition from central planning to marketisation and privatisation in the ex-

USSR and Poland has been a fiasco. While production has collapsed and social misery accentuated manifold in these countries, the west has gained very little by way of trade or investment opportunities. By any criterion other than that of free market ideology, the big bang approach has been a 'deadweight loss' for all concerned. On the other hand, the west or Japan did not have much of a stake in the USSR or East Europe by way of trade or investment; hence the tragedy did not pinch their pockets, except in the special case of East Germany. But China is a different story altogether. Alexander Haig, the former US secretary of state, is now lobbying for China, promoting in particular US investments in Guangdong, recently he said that he "welcomes China's entry into the GATT", but did not want to "exaggerate the benefits to China of membership" (*Beijing Review*, July 4, 1994, p 12) (emphasis added).

This last statement could as well come from the Chinese leaders. Why should they abandon their half-way house and embrace the *laissez-faire* philosophy enshrined in the GATT? Quite apart from the ideological 'overhang' of communism, there is no objective reason for them to make a *volte face*. Against the last few decades of relative stagnation under the old regime in the USSR and east Europe, China's performance has been sparkling. I can think of no nation in the world that opted for a systemic transformation in a period of unprecedented prosperity. How can China privatise her SOEs in the next 10 years unless she is willing to let foreigners take a grip over the commanding heights of the economy? Can whatever remains of central planning be given up in favour of atomistic competition through the market alone - without disrupting the chain of production? Even if there were no ideological opposition, restructuring through the induction of foreign and domestic private capital into the SOEs would certainly lead to a massive fall in output and employment; no leadership can countenance the economic and social turmoil that would ensue.

Then there is the question of local authorities. Decentralisation of political and economic power in contemporary China has gone very far with deep historical roots. These organs are in some ways like quasi-states, far more powerful than the state governments in India or the US. Even if the central leaders are willing, the local authorities may not give up their planning role and take directives from the market alone. They also shoulder a special responsibility not borne by the states in India or the US. Despite the phenomenal increase in employment in rural enterprises to more than 100 million in 1992 (*Beijing Review*, October 24, 1994, p 12), the problem of surplus labour in rural China is extremely acute. At least 20 million of them are roaming around from place to place in search of jobs. Estimates of surplus rural labour reach up

to 100 million (*Reuter report in The Economic Times*, October 28, 1994, p 2). Since the local authorities are directly responsible for the well-being of the local population with little assistance from the centre except during emergencies, and derive a large part of their incomes from the operation of enterprises within their territories, it would be suicidal on their part to leave the fate of the TVEs to the impersonal market.

My own reading is that China is likely to join the GATT, and hopes to emulate Japan, infringe upon many of the GATT stipulations even after 2005, but keep tinkering all the time with her economic system at the margin. At the November 1994 meeting of the APEC forum in Indonesia, China refused to commit herself to regional free trade as late as the year 2020; Japan took the same position (*The Economic Times*, November 4, 1994, p 25). In view of the opaqueness in the structure of the SOEs and TVEs ('multiple mothers-in-law'), a legal system very different from the Euro-American one, the over-arching role of the Communist Party in all spheres of life, and so on, it would be wellnigh impossible for an international body like the GATT (or its successor, WTO) to police the economic transactions between authorities at various levels and the firms in their charge. When glaring anomalies are brought to light, China will make appropriate concessions as Japan has been doing.

XV Conclusion

For all the economic successes of the past 15 years, the Chinese leaders are haunted by the spectre of social upheaval. Vice-premier Zhu Rongji admitted that coastal areas of the country have developed faster, though in "recent years... some inland areas have also experienced rapid development". He hopes that the distribution of income "will be regulated" by reforming the income tax system, and "perfecting" the social security system, "thus maintaining the social stability" (*Beijing Review*, July 11, 1994, p 8ff).

What went wrong? With its monetarist obsession, the western press is obsessed by the menace of inflation, now running at 20-30 per cent per annum in the major cities. The Chinese do not underplay it, but an all-out fight against inflation is neither necessary nor desirable. An opinion poll conducted in October 1993 by the market research firm, Horizon, found that 75 per cent of 1,539 respondents from Beijing, Shanghai and Tianjin felt that 'inflation was outstripping their income growth'; yet for 64 per cent of the total, inflation was 'bearable', and more than one-half dismissed the possibility of widespread hoarding of food as in 1988 (*FEER*, March 3, 1994, p 53). Subsequent reports paint a similar picture. The inflation, in any case, is not disrupting production or investment.

Houghton

A second source of latent tension is the absence of trade unions to defend workers' legitimate interests and the prevalence of appalling working conditions in innumerable enterprises. Officially, out of 1,70,000 foreign-funded joint ventures employing in 1993 over 10 million workers, trade unions covered barely 12 per cent of workers. In 4,00,000 township enterprises employing 25 million workers, just 8 per cent are unionised (*Beijing Review*, July 11, 1994, p 7). Creating trade unions may not be enough. As the *Business Week* (reproduced in *The Economic Times*, August 1, 1994, p 9) remarked, the All-China Federation of Labour is just a pliant tool of the government, and not much can be expected without strict vigilance by the government. Working hours are often excessive, causing a large number of accidents. Guangdong alone officially reported 45,000 industrial accidents in 1993, claiming more than 8,700 lives. The situation is grave as foreign ventures now employ millions of workers in the whole of China. Although the official media have targeted firms with Hong Kong capital, others believe that mainland Chinese investors running joint ventures inside the country through Shell companies in Hong Kong, are among the worse offenders. In my view, the Chinese leaders may take corrective measures to stamp out overexploitation of labour without jeopardising growth prospects. In South Korea, Taiwan, etc, conditions were no less deplorable initially; a gradual amelioration did not cause a rupture in the dynamics of these economies.

More intractable is the question of unemployment. According to official data, urban unemployment is on the wane, the number in million declining from 5.4 in 1980 to 3.6 in 1992 (*Beijing Review*, October 24, 1994, p 22). In the absence of substantial unemployment benefits, these numbers may not mean much. The real threat comes from rural areas on which some figures were given in the previous section. It can become explosive unless ways are found quickly enough to create productive jobs in cities and villages and stem (through economic measures) the inflow of surplus rural labour into urban areas. Despite the great achievement of the TVEs, I am sceptical if 'full employment' even at comparatively low wages can be attained in the foreseeable future. Hence the accent may shift to welfare schemes to contain antagonism as between social classes.

As for the distribution of incomes, there is a silver lining. The number of the poor (annual) income per capita in 1993 of less than 360 yuan in official headcount, dropped sharply from 250 million in 1978 to over 80 million in 1993. Yet the disparities are still striking. Children at prominent schools in Beijing and Chengdu spend annually up to 10,000 yuan on tuition, but many in Shuichung County, Guizhou province,

cannot attend schools charging 60 yuan per month in fees (*Beijing Review*, May 16, 1994, pp 7-9)

Progressive taxation to reduce inequalities is still at its infancy. Currently, a Chinese citizen earning more than 800 yuan per month has to pay income tax, the threshold is higher at 4,000 yuan for foreigners, and the maximum tax rate is 45 per cent for all individuals. Capital gains on trading in stocks (shares) are tax-exempt. The total collection of personal income taxes from citizens and foreigners amounted to just 1.3 billion yuan in the first quarter of 1994 (*Beijing Review*, April 26, 1994, p 96). How good was the tax effort? A recent official survey estimated the number of Chinese households with an annual income exceeding 50,000 yuan at 5 million, of which over 20 per cent earned more than 1,00,000 yuan per family (*Beijing Review*, September 19, 1994, p 29). From the latter set of figures, I make the following guesstimate, the average annual income in yuan was 75,000 for the first 4 million households, and 1,20,000 for the remaining 1 million households, hence the two groups had a combined quarterly income of 1,03,000 ($= 18,250 \times 4 + 30 \times 1$) million yuan. Since lower income groups (9,600-50,000) were also taxable, the income tax collected from the rich (50,000+) groups in January-March 1994 was just above 1 per cent of their income. This simple exercise reveals that the 'threat' of income tax is a paper tiger in China today, notwithstanding the pious wishes of the leadership. One gets an idea of disparities when one looks at the earnings of Shenzhen workers, currently putting in 12-13 hours a day for one yuan (12 US cents) per hour (*FEER*, June 16, 1994, p 35). In real terms that is not higher than the daily wages of an unskilled labourer in Calcutta. Average annual wages in 1992 of 'employees' in all sectors stood at 2,713 yuan, while those in agriculture and industry were respectively 1,725 and 2,774 (*Beijing Review*, October 24, 1994, p 19).

I can think of two reasons why the authorities are so half-hearted in the matter of income taxation. First, like their counterparts elsewhere, the Chinese rich are reluctant to part with 'hard earned' wealth by way of taxes. Being well connected to the political apparatus, most of them escape the tax net. More important perhaps is the belief of Deng Xiaoping and his followers in the notorious 'trickledown theory', let some people get rich today, and gradually wealth will spread to the rest of the society. It could be a legitimate reaction to the 'iron ricebowl' dogma of earlier years when there was little correlation between an individual's effort and his earning so that workers had little incentive to contribute to the social output to the best of their ability. But that contradiction persists to this day in a new form. With so many opportunities for speculation, corruption, and so on, there is

till no correlation between effort and earnings, which gives rise to popular hostility against the *nouveaux riches*. This revulsion, in turn, springs to a large extent from the socialist, egalitarian ethos which struck deep roots among the people.

There are no decisive arguments, theoretical or empirical, vindicating either egalitarianism or its opposite. If the post-1978 acceleration in China's growth is attributed to the introduction of the market and a flexible incomes policy, invoking the logic of *post hoc ergo propter hoc*, the same factors must also be held responsible for what Ellman (1994) appositely calls *katastroika* (catastrophe in the wake of perestroika) in the ex-USSR. Moreover, according to president Clinton's economic advisors, in the 1960s the marginal income tax peaked at 80 per cent as against 30 per cent in the post-Reagan era when economic growth slowed down considerably. On a more 'practical' plane, one might reckon that 'homegrown' capitalists are needed to deal effectively with the international bourgeoisie. Should influential persons be helped to steal state property (see above) in the process? *Beijing Review* (July 11, 1994, p 6) complained that many local authorities are selling off assets to private firms, domestic as well as foreign, 'soon' there will be a law to prevent the disposal of state property worth \$ 352 billion. Was it essential for Chinese managers to book profits running into millions of dollars, through insider trading before their companies were listed on the Hong Kong Stock Exchange? Scores of Soviet professionals since the 1920s had commanded the respect of western industrialists and bankers for their business acumen, without having amassed personal fortunes. The same is probably true of a large number of contemporary Chinese specialists, including the present vice-president Rong Yiren. The 'pragmatic' logic is just as fragile as others.

If I remain sceptical about the 'need' for millionaires in a developing economy, I would not go to the other extreme and assert that China during the Cultural Revolution had a 'socially optimal' distribution of income. That the latter was socially left to be more fair, is beyond dispute, and that constitutes a major source of social tension. No one swearing by democracy can honestly ignore such sentiments unless there is sufficient evidence that these are in conflict with the 'transcendental' goal of a more rapid growth, such evidence does not exist.

Western media have carried news about peasant unrest in China for the past couple of years. 'The problem of relieving the burden on peasants is not only an economic problem, but also a political problem', *The People's Daily* recently admitted in a front-page commentary. *The Associated Press* further reported that local authorities were milking peasants for road construction, irrigation

facilities, etc. Against rampant exactions, the Centre fixed a ceiling of 5 per cent tax on peasants' incomes, and banned the levy of dozens of fees toward 'social stabilisation', 'toilet management', etc (*The Telegraph*, November 6, 1994, p 3). In 1993, China's *Economic Daily* published a survey report indicating that peasants paid local taxes and fees amounting to under 25 per cent of their incomes. *The Economist* (May 8, 1993, p 29) correspondent interviewed some working peasants in Sichuan who claimed to have shelled out as much as 35-40 per cent of their income. There is little doubt that the levies on peasants far exceed the maximum stipulated by the centre, which may be contrasted with less than 1 per cent income tax collected from the urban rich.

Despite much popular discontent, the flashpoint may not be reached if the trajectory of economic growth does not falter in its course. Leaving aside a couple of hundred million persons living below or just above the absolute poverty line, the overwhelming majority, especially in coastal areas, have experienced a dramatic rise in disposable income and consumption. Per capita consumption in peasant households increased in real terms by 7.85 per cent per annum in 1978-90, though the rate had dropped sharply to a mere 0.2 per cent in 1988-90 (Islam and Hien 1992). The urban levels of living should have expanded even faster. This majority of workers and peasants, not to speak of the *nouveaux riches* and the Communist Party, have a stake in the status quo. But upheavals can take place even in the midst of plenty, as witnessed in the mighty wave of youth and student protest in France, Germany, Italy and US during the 'swinging' 1960s.

What lessons, if any, can be drawn from China's experience? The foundations of China's growth, I may recapitulate, were internal in nature and access to foreign markets provided a vital outlet, helping the country to tide over numerous internal bottlenecks. The access was predicated upon China's informal political alliance with the US. Nixon's visit to China in 1972 took place just as the Vietnam war was hoisting up much to America's discomfiture, and Deng's voyage to America in early 1979 coincided with the Soviet invasion of Afghanistan. Like Japan, Taiwan and South Korea in the previous decades, China's privileged entry into the US market cannot be explained in isolation from the Soviet-American cold war. After the collapse of the USSR, no country is likely to obtain political and economic favours on a similar scale. In any case, the prolonged recession in the G-7 countries is likely to turn them even more protectionist, notwithstanding the GATT. Hence another miracle cannot be expected round the corner.

Above all, China's experience illustrates most vividly the contemporary relevance of 'economic self-reliance' as the motor of

growth in a developing country. Barring shorter or longer spells, other east Asian countries like Japan, South Korea and Taiwan had followed the same path. Self-reliance does not refer to a closed, autarkic economy as alleged in neoliberal caricatures of the idea; it implies simply a balanced two-way flow of goods, services and capital with the rest of the world. Concretely, developing countries that had a plan frame, can avoid the pitfalls of *katastroika* and learn from China the following: (a) In encouraging domestic market forces, a proper sequencing of measures is crucial for the plan frame to remain effective and yet more flexible. (b) Any new policy that may disrupt domestic production, investment and employment even in the short run, should be avoided unless the long-run benefits in all three respects are clearly demonstrated. (c) A long-run equilibrium in the BOP current account ought to have a binding constraint so that imports and foreign capital flows are regulated accordingly. Developing countries that never had a plan frame should create one, not by administrative fiat, but by evolving a national consensus. On the other hand, small countries in Asia, Africa or Latin America, cannot have meaningful plans unless they form large regional blocs, independent of the global triad. All these prospects are dim so long as the vast majority of developing countries remain under the surveillance of the Fund-Bank duo.

It is ironic that influential government and business circles in India have been hankering after a berth in the NAFTA, EC, APEC, and even ASEAN, without any positive response from the other side. Curiously, when the Chinese Ambassador to India recently mooted the idea of a Sino-Indian trade bloc, our officials were nonplussed. Only a handful of forward-looking Indian businessmen are expanding contacts with China through trade as well as joint ventures.

The story of China has no less relevance for the rich countries. Guided by the myopic and narrow business interests of their own transnationals, the so-called 'national champions', these governments have become prisoners of monetarism; they seek to overcome domestic demand deficiency by 'prying open' the markets of dependent countries in different corners of the world. In the short run, their exports and investments abroad may go up; but insofar as domestic resources in the importing countries are replaced by imports and 'devaloured' in the process, their growth rate must come down. In subsequent rounds, their capacity to absorb imports from the rich countries will also diminish, accentuating recession on a global scale. China which refused to embrace neoliberal theory, offers the almost perfect counter-example. Her balanced two-way trade and investment with the G-7 countries created over time far greater business

opportunities than the latter's dealings with a whole host of indebted developing countries taken together. The attitude of the governments is no different from that of Harvard students attending the class of Robert Reich, the present US secretary of labour; they preferred both America and Japan to grow at 1 per cent a year, rather than Japan leapfrogging at 3 per cent against 2 per cent for the US (*The Economist*, reproduced in *The Economic Times*, November 4, 1994, p 7). To get over their own recession and clear the frightening backlog of 35 million unemployed in the OECD region, the rich nations have to abandon their basically neomercantilist, beggar-thy-neighbour approach masquerading as liberalism, and appreciate that a prosperous, rather than an impoverished, third world creates more propitious conditions for their own progress in the long run. Policy instruments have to be drastically redesigned to enable an ever-increasing proportion of mankind to participate in the process of development without sacrificing their independence and dignity. But, alas, the political prerequisites for such rethinking do not exist in the citadels of global power.

Transnationalisation of Third World State and Undoing of Green Revolution

Meera Nanda

The current internationalisation of capital has the effect of transforming the state into a 'transnational state' in which domestic, social and political relations are increasingly shaped by global capital circuits. In contrast to the green revolution period, the current phase of internationalisation of agribusiness impedes the ability of third world states to formulate self-sustaining and pro-poor agricultural policies.

I Introduction

STUDIES of science and technology policy presuppose a pivotal role for sovereign nation-states in generation and advancement of new knowledge. It is true that it has never been possible to contain scientific ideas and technological advances within the boundaries of nation-states: new ideas tend to spill over beyond their place of origin into distant lands through relatively peaceful (eg, trade, licensing) or coercive (eg, colonialism) means of technology transfer. Yet, the original impetus for scientific research and innovations has been assumed to originate from individual nation-states, each responding to its internal balance of class power and social needs. Radical and liberal chroniclers/critics of science and technology alike tend to give pride of place to the state, both as a source of new innovations and as a source of checks and balances on the use of these innovations.

But recent and ongoing changes in the global economy suggest that states can no longer be assumed to be autonomous "national communities of fate", that govern themselves and determine their own future [Held 1991: 142]. The current internationalisation of capital has the effect of transforming the state into a "transnational state" in which domestic, social and political relations are increasingly shaped by global capital circuits. The resulting redefinition of the state, in which "policy choices and regulatory frameworks are increasingly governed by needs for global competitiveness, rather than national coherence" [McMichael 1992: 344], calls into question the prevailing conceptions of the state in the state-centred paradigm of science and technology policy studies.

Even though transnational states continue to claim the same formal political sovereignty over decisions related to 'national' economy and growth as enjoyed by the classic nation-states, their actual autonomy in policy-making and national regulation has been severely eroded by the structures of the global economy. This disjuncture between formal political sovereignty and actual autonomy over policies that affect local/domestic affairs is especially troublesome for third world states, which have historically been

subordinated to the industrially developed core countries through colonialism and imperialism. Transnationalisation makes these countries' policy-making apparatuses increasingly subject to the vagaries of international economic and technological forces.² Under these circumstances, national governments are forced to curtail their traditional – and in the developmentalist states of the third world, essential – functions of protecting national markets in money, labour and commodities. This retrenchment of the state is simultaneously a result of, and a cause of, (further) subordination of national priorities to the international market dynamic. In third world countries, this implies a gradual undermining of goals of development and need-satisfaction.

This paper aims to examine the impact of the current phase of internationalisation of agribusiness on the ability of third world states to formulate self-sustaining and pro-poor agricultural policies. It is argued here that compared to the earlier period of agricultural modernisation – the so-called 'green revolution' – the current phase does not allow agricultural innovation policies to be guided by national development priorities. Public institutions which shaped the green revolution policies, both at the level of national governments and in international agricultural research organisations, are shrinking in importance and are in the process of being replaced by unregulated, transnational market forces.

In order to make this case, the paper first describes the contours of the emerging food regime in which transnational capital is dictating, and even replacing, national policies. Here, the emergence of the so-called 'new agricultural countries' (NACs) will be discussed. The 'new agriculture' of selected third world NACs (notably Mexico, Brazil and Chile in Latin America, Thailand and increasingly India in Asia) is 'new' only insofar as it replaces colonial commodities (bananas, sugar, cotton, etc) with new exports (fresh fruits and vegetables, flowers and poultry and meat products). The new agriculture, it is argued, serves to articulate local production relations in the NACs to the world economy more closely than colonial agriculture ever could, and thus causes an even deeper disarticulation of agriculture from the needs and lives of the local

populations. The emergence of NACs is discussed in the context of the larger changes in the world economy.³ The next section tries to provide a theoretical understanding of the process of transnationalisation of the state, including the policy-making options open to the state. The final section examines in detail three policy arenas which are in effect unravelling the national development policies encoded in the green revolution. These policy arenas include state support for agriculture, contract farming as a substitute for state-supported extension services, and the changing division of labour in agricultural research. The paper concludes with some thoughts on the implications of these policies for the idea of development.

Although this paper does not directly set out to understand the changes in Indian agriculture, it is hoped that an analysis of the older, well-established NACs in Latin America (especially Mexico and Brazil) will help understand the entry recently of Pepsi and other transnational agribusinesses in India.

II Transnationalisation of Agricultural Production

Any mention of the 'global economy' generally evokes an image of a global assembly line, churning out manufactured goods from garments to cars. It is not fully appreciated that changes in the world economy have globalised agricultural production as well. Internationalisation of the agro-food industry works roughly on these lines: selected third world 'Newly Agricultural Countries' or NACs⁴ specialise in exports of labour-intensive 'luxury' crops – off-season and exotic fruits and vegetables, frozen juices and fresh cut flowers – in addition to export of animal feed, beef, poultry and fish, etc, while the industrialised countries of the north specialise in export of 'basic' wage-foods, e.g., wheat.

This configuration is fundamentally asymmetrical, for as McMichael and Myhre point out, "while the South's agro-food production is reoriented to higher value markets overseas, the North exports (indeed dumps) its domestic surpluses. The former compromises or pre-empt[s] a coherent national agricultural sector, while the latter expresses

the highly protected agricultural sector of the metropolitan nations" [1990: 67]. This is what leads to the paradoxical – and cruel situation exemplified by Mexico which has become a major agricultural exporter of 'luxury' commodities but has to depend on import of foodgrains to meet local food needs [Barkin 1987]. Agricultural policies in these NACs have become "denationalised" [McMichael 1992:354], which is to say, they have become disconnected from the idea of national self-sufficiency in food. The ability to satisfy the food requirements of the population through local production was the motivating idea behind the green revolution. Clearly, the rules of the old "food regime" do not work anymore.

But while this asymmetry and import-dependence of the third world is not new, something qualitatively different from all earlier stages of capitalist agriculture is happening to world agriculture. This new element has been described by William Friedland as a movement from 'polyglot local farming practices to concentrated corporate-capitalist agricultural production, [a] movement from rural farming to industrial agriculture" (1991:3). All earlier agricultural practices, from family (or peasant) farms to the 'Fordist' extension of chemical and mechanical agriculture (the typical green revolution agriculture) are giving way to a highly industrialised and capitalised food sector which utilises generic foods cultivated anywhere in the world for the production of processed foods, or simply as commodity links for production of beef and other animal-based food items. This basic change is well described by Friedland

The present situation is one in which the connotations of 'farming' in particular rurality and community, but also other categories that are limited to national economies, nation-states and national societies – are giving way to vertically and horizontally integrated production, processing and distribution of generic inputs for mass marketable foodstuffs (1991:3-4).

Before we examine the changing nature of state policy-making that has allowed the new food regime to emerge, it will be useful to take a closer look at (a) NACs and how they are articulated to transnational agribusiness; (b) how food production in NACs has become disarticulated from the needs of the populace for food; and (c) the historical evolution of NACs.

NEW AGRICULTURAL COUNTRIES (NACs)

These countries have emerged as exporters of the so-called 'non-traditional' food, feed and horticultural commodities sold under major transnational brand names to the world market, including markets in North America, Europe and Japan (and increasingly Hong Kong as well). Luxury food production accounted for a quarter of the third world's total processed food output in 1980, making

it one of fastest areas of industrial growth [McMichael and Myhre 1990]. As in manufacturing, not all third world countries are equally incorporated in this circuit: sourcing is limited to a handful of middle-income third world countries, and based upon their 'comparative advantage' in climate and labour costs, different countries are emerging as specialised sources for particular items.

Latin American countries, for instance, satisfy the growing taste of North Americans for year-round fresh tomatoes, lettuce and table grapes and for more exotic fruits and vegetables. In 1990, the US imported more than \$1.6 billion worth of fresh and processed vegetables from Mexico alone. Mexico now provides nearly half of all fresh tomatoes consumed in the US along with temperate crops such as asparagus, broccoli, cauliflower, etc. Chile is a major off-season exporter of fresh fruits during the northern hemisphere's winter months. Table grapes, apples and pears account for roughly 90 per cent of Chile's total export volume, though it is diversifying into specialty fruits such as apricots, cherries, nectarines, kiwi fruit and avocado. Brazil is the world's largest frozen orange juice exporter. Frozen juice makes up Brazil's third most important agricultural export after coffee and soybean. The Caribbean countries, especially Costa Rica, the Dominican Republic and Guatemala have become the major exporters of fresh and frozen vegetables and juice to the US. In addition, Colombia has emerged as the world's second largest exporter of fresh cut flowers (after Holland), with nearly 80 per cent of its flowers headed to the US [Llambi 1993].

Similarly, African and Asian countries are beginning to supply luxury food markets in Europe, Asia (mostly Japan and Hong Kong) and the oil-rich Middle East countries. Kenya, Zimbabwe and South Africa are big fresh produce and flower exporters to England, France and western Europe. Malaysia and Thailand are emerging as agro-exporters for Japan and Hong Kong. Thailand is increasingly seen as 'Asia's supermarket' and is beginning to supply not just fresh produce but also animal feed and broilers to Japan and other countries [McMichael and Myhre 1991]. Other third world countries are joining the ranks of NACs. The government of India, for instance, entered an agreement with Pepsi Company in 1988 to let it set up two industrial facilities for processing fruits and vegetables to be specially grown for processing in Punjab, the largest grain producing state in the country. Pepsi will not only process the produce, but also organise the production through contracting the local farmers [Chakravarty 1989].⁶ (More on contract farming below.)

The important point to note is that non-traditional food exports in all NACs are vertically integrated into major transnational

agribusinesses. Being perishable, fruit and vegetables (and of course fresh-cut flowers) require capital-intensive 'cool chains' which maintain chilled temperatures from the point of origin to the point of sale. Major and well known TNCs, including household names in North America like Dole and Chiquita, have been able to provide the infrastructure and co-ordination needed for this business. Some of these TNCs, like Chiquita, Del Monte, and Dole, started out in banana (and pineapple) production in the Caribbean and South America and have only recently diversified into fresh fruit and vegetables.⁷ Some new agribusinesses like the Polly Peck and Albert Fisher Group (both UK-based) corporations have no previous experience in traditional third world food exports.

Another highly transnationalised and non-traditional food export from the third world includes feed for livestock production. Livestock production in the industrial countries has changed from being a national sector to a transnational big business linked through corporations to farms and feedlots all across the world.⁸ Through aggressive state policies, encouraged by multilateral banks, Brazil and Mexico in the Americas and Thailand in Asia have become major exporters of animal feed. Along with traditional animal feeds like soybeans, Brazil has established a big market in pulp from the frozen orange juice industry and Thailand is expanding production of tapioca for animal feed [Friedmann 1993].

DISARTICULATION FROM NATIONAL FOOD SELF-SUFFICIENCY

Even a cursory examination of the new agriculture reveals that it is less a vehicle of national agricultural modernisation rooted in a maturing home market, and more a profitable component of internationalised circuits of consumption and production. The food sector is no longer seen as a part of basic need satisfaction but has instead become a source of inputs for transnationalised agro-industry. It has meant pre-empting national food sufficiency and indeed, national food entitlement policies in many NACs.

One evidence for this 'denationalisation' of food policy comes from Mexico where:

The bulk of Mexican exports is accounted by coffee, fresh fruits and vegetables and livestock, while the majority of imports are basic foodgrains, followed by feed grains and oilseeds. In other words, Mexico exports non-essential commodities and imports essential ones [Raynolds 1993:110].

Mexico achieved self-sufficiency in food by the early 1960s. But by the early 1980s, the country had again become dependent on imported corn to satisfy the food needs of its people. During 1982-86, according to David Barkin, agriculture grew faster than the economy as a whole, but the country was forced to import large volumes of corn to meet domestic needs. Overall, the per capita

food consumption declined, even as the agricultural sector as a whole boomed. Part of the reason for this disjuncture lay in the fact that Mexican farmers were planting sorghum for animal feed instead of corn for human consumption. These changes are evident from the data on harvested land in Mexico: the area under food crops (especially maize) declined precipitously between 1965 and 1982, while sorghum production exploded, becoming the country's most extensive research crop [Barkin 1987:278].

Internationalisation is a big part of the reason for this shift. According to Barkin, by moving to sorghum Mexican farmers were only responding to the price signals in the national markets. The crucial twist to this scenario is that in the absence of support prices set by the Mexican government, the national prices reflected prices in international futures markets. Barkin ascribes the end of food self-sufficiency in Mexico to the fact the Mexican state has allowed international price signals to dictate agricultural policy and the allocation of resources.

But reliance on food imports is only one indicator of integration into transnational circuits of capital. Equally important is the manner in which this integration takes place at the level of production. According to Steven Sanderson, another well known critic of internationalisation of Latin American agriculture, the vertical integration of peasants into agribusiness through contract farming "denationalised production by shifting the locus of producer control away from the farm toward the agro-industrial enterprise [which] in turn, is likely to employ technologies of production emanating from TNCs at the international level" [Sanderson 1985:53]. This process completely destabilises the traditional farmers either by forcing them to shift away from subsistence production (or basic food production for the market) into producing inputs for agro-industry, or by simply marginalising them with respect to the economy at large.

Furthermore, at the level of the consumer market, the productive apparatus of TNC agribusiness tends to be geared toward global markets at the expense of domestic consumers. As many analysts have pointed out, export promotion of special food products – frozen orange juice from Brazil, modern poultry industry in Mexico and Brazil, frozen strawberries from Mexico, to cite some examples – serve mass markets in more affluent countries and the more affluent, upscale consumer markets internally.

HISTORICAL EVOLUTION OF NACs

One way to understand the emergence of the 'new' agriculture described above is to see it as the end of the import-substitution model of agricultural modernisation associated with the green revolution and the adoption of export-led development by a growing number of third world countries.⁹

One advantage of this perspective is that it explains changes in agriculture as a subset of the larger changes in global economy that have encouraged an export-led, market-oriented growth in all parts of the world. In other words, the same global changes that have led to globalisation of industrial production in NICs are responsible for NACs.

These larger economic forces can be broadly characterised as 'internationalisation of capital', which is leading to a more integrated world economy [Jenkins 1987].¹⁰ This thesis tries to explain the growth of transnational corporations as an aspect of 'self-expansion of capital' (both banking and industrial capital) beyond national boundaries. A big push for internationalisation of capital came in the late 1960s and through the 1970s as the US faced increasing competition from Japan, Europe and lower-wage, newly industrialising countries. Alongside with productive capital, this period also witnessed the centralisation of banking capital on a world scale, a phenomenon which took its toll on the third world through the debt crisis.

Major transnational banks, flush with petrodollar deposits from the Arab countries, advanced huge sums of money to selected third world countries through the 1970s to help them finance their import substitution industrialisation. But following Reagan's 1979 monetary policy in the US, which raised the interest rates for the debtor nations, and the general global recession, major third world debtors had to borrow simply in order to pay the interest. Debt acquired crisis proportions in 1982 when Mexico nearly defaulted. Although the creditors have devised case-by-case strategies to allow the debtor countries to pay back the debt, the entire process had forced a major structural change in third world countries, especially the debtors in Latin America and Africa. Two major consequences that are relevant to our purpose include. (a) an end to import substitution industrialisation and the beginning of a more outward-oriented, export-based growth, and (b) a larger overseeing role for multilateral financial institutions (especially the IMF and the World Bank) in the economic policies of the third world [Gilpin 1987: 317-28].

Against this background, it becomes possible to see the green revolution as part of the earlier import substitution mode of modernisation in which nation-states formulated policies aimed at national self-sufficiency.¹¹ In other words, the green revolution belongs to a world order in which the economy was still not a 'world economy' but an international economy and national regulation of economies was possible. NACs represent an undoing of this "national coherence" [McMichael 1993]. The 'new agriculture' is instead subordinated to international price signals and "national development becomes international and local

economies become a part of the global market" [Barkin 1987:275].

The integration of third world (and the formerly communist countries of the eastern bloc) in the international economy, however, is influenced by a historically determined unevenness in wages and technological abilities. Indeed, seen historically third world food and agricultural policies have been deeply influenced by the domestic farm policies of major food exporting countries, especially the US. The food regime analysis by Harriet Friedmann provides some interesting insights into this structural imbalance (1990, 1993). Very briefly, the source of third world dependence (and US dominance) lay in the wheat surpluses the US government held from 1947 to early 1972. These surpluses were the result of the price support the US government began to offer to American farmers as a part of the New Deal in 1930.¹² Immediately after the second world war, the US government used Marshall Aid funds to buy surplus commodities for subsidised sale in Europe. After the reconstruction of Europe, the surpluses were directed to the third world as part of PL 480 food aid. This provided third world governments a way to keep their food prices (and consequently, industrial wages) low without having to improve their domestic food production. The American food surpluses abruptly ended with the gigantic grain deals the US made with the USSR in 1972 and later. By then, a select handful of NACs (notably Brazil) began to compete as exporters of feed grains to Japan and other countries. But many other third world countries, their economies dependent on American surpluses, were forced to buy grain on world markets. The point to note is that the dependence of some NACs on imported foodgrains is a historical legacy of US farm policies.¹³

Apart from the larger economic changes in the world economy, technological substitution of traditional exports of third world countries has played an important role in the emergence of NACs. Industrial "substitutionism" [Goodman 1991:38] has long been a strategy of the food industry to get around the biological constraints (including locational and seasonal specificities) of agricultural production. Wherever possible, the food industry has tried to develop (a) industrial substitutes for plant-derived products, and (b) generic raw materials substitutable for one another.¹⁴ Replacement of sugar with industrially produced high-fructose corn syrup (which now accounts for nearly 40 per cent of sweeteners used in the industrialised countries), and replacement of palm and coconut oils with soy oil (an industrial by-product of soymeal animal feed) are familiar examples of how substitutionism has reduced the world demand for traditional tropical exports. Some other high-value traditional

exports, e.g. vanilla, might be facing a similar fate with the development of tissue culture technologies [Buttel 1990]. As markets for traditional exports dried up, third world countries were forced to diversify into other high-value crops including flowers, fruits and vegetables.

III Transnationalisation of National Policy-Making

As described in the previous section, transition to a world economy tends to replace national regulation with price signals from the world market. But this transition does not mean a diminution of state power, rather it has the effect of transforming the national state into a 'transnational state'. Robert Cox provides a very succinct definition:

The internationalising of the state is the global process whereby national policies and practices have become adjusted to the exigencies of the world economy of international production. Through this process, the nation-state became part of a larger and more complex political structure that is the counterpart to international production. [as a result] *the internal structures of states are adjusted so that each can best transform the global consensus into national policy and practice* [Cox 1987: 253-54; emphasis added]

That the nature of national governments – and consequently, the nature of politics itself – changes in the process of internationalisation of production is an important insight. Very often, analysts and/or critics of the world economy tend to portray the changes in world economy as a zero-sum game between autonomous nation states, with the third world generally at the losing end.¹⁵ Even those science policy analysts who are trying to bring policy-making in tune with the fact of globalisation often fail to see the structural changes that have taken place in the interests and constraints on governments' ability to make policy decisions.¹⁶ Rather than simply trying to reconcile the national interest with the international, it is important to identify the ways in which the international has become national.

This idea of transnationalisation of the state is only now beginning to be theorised in social science literature. It has recently received extensive treatment from prominent political theorists including David Held (1991) and Robert Cox (1987). The concept has been used to understand the changing nature of agricultural production by a group of rural sociologists at Cornell University, including the prolific Philip McMichael (1990, 1992, 1993, 1994). In this section we will use the insights these authors offer to update and revise our understanding of the role of the state in policy-making.

The two most important actors in policy-making include the government and businesses. Knowledge generation and diffusion is seen as a part of government's job to create resources for the nation. Businesses, on the other hand, do not have any such national mandate. While they make vital decisions about investment in, and production of, technologies with which we live, business decisions remain outside of the democratic mechanisms for public accountability. This is the idea behind Charles Lindblom's (1977) notion of the "privileged position of business" which explores how businesses take over many essential (and "momentous") functions of the state in polyarchies, and thus exclude them from popular control.¹⁷

Even though liberal political theorists like Lindblom are critical of the fact that the profit margin of private businesses is allowed to decide matters of great consequence to society, they do not despair of the market. Lindblom is indeed quite emphatic about the superior ability of the market (as compared to bureaucratic planning) to express popular demand for goods and services – and to maintain a higher degree of accountability within the authority structures. His idea of a "hybrid form of popular control" (1977: 156) aims to bring markets under larger polyarchal (government) control without, however, curbing their dynamism with excessive governmental interference. For this purpose, Lindblom proposes to turn the privileged state of businesses into an opportunity for popularly controlled governments to demand social accountability from markets. If businesses need inducement from governments (in the shape of tax breaks, subsidies in the form of basic research and development and the like), then the government should, in return, direct them to conform to certain socially acceptable norms, including the choice of technologies, the pace of their development and sensitivity to the environment.¹⁸

This idea of hybrid control rests squarely on the assumption that the business operating within the jurisdiction of a government can serve the needs of the citizens of that society. Or as David Held puts it, there is an assumption of a "symmetrical and congruent relationship between political decision-makers and the recipients of political decisions" (1991: 139). But this assumption can hold only as long as markets respond to the efficient prices set by the demand-and-supply internal to a society. Once the production and investment decisions of private businesses begin to be shaped by signals from the world (rather than the local/national) markets, state inducements and other regulations can no longer be simply assumed to serve the larger national welfare. The state in market economies, in other words, cannot simply justify the inducements it offers

businesses as serving the welfare of the whole society. The very possibility of a national economic policy is, accordingly, reduced.

Marxist explanations of the role of the state in policy-making are equally handicapped by taking the existence of sovereign nation-states for granted. Without going into the details of Marxist theory of the state – a subject too vast to be addressed here – we can get a good idea of its limitations through Jack Kloppenberg's analysis of the development of the seed industry in the US [Kloppenber 1988]. The state in a capitalist society is "charged with providing the conditions for profitable accumulation [of capital]" (1988: 13). In the agricultural sector in the US through the 19th and early 20th centuries, it meant destruction of all those relations of production which were not fully integrated with the market and the subordination of all use value to the logic of profitability. To serve that end, the US government supported a massive research effort to make better seeds and other farm supplies available to the farmers, science in this instance was "incorporated into the historical processes of primitive accumulation and commodification" (1988: 10). But as this science-based commodification of the rural sector progressed, public sector involvement became an obstacle to profit-making for private seed companies. Again, in order to serve the needs of capital accumulation, the public sector was forced to withdraw from actually making improved seeds available to the farmers. Thus the state is basically a tool for capital accumulation for the owning classes and changes its priorities, policies and laws in order to serve that overarching goal.

Apart from denying the state any autonomy at all, this account of the state is too tied to the class interests embodied in the domestic economy – state policies help national capital expand into sectors of the national economy, while any international component of these policies (collection of germplasm from the third world, in Kloppenberg's case), is simply meant to aid the process of capital accumulation at the national level. The limitations of this perspective become clear in view of the fact that in third world countries today, peasants engaged in subsistence farming are being directly integrated into global agribusiness through contract farming. Capital accumulation, even primitive accumulation, is hardly a national matter anymore.

The common problem with both the Marxist and liberal theories of democratic (or more exactly, polyarchal) states has been succinctly summarised by Held (1991: 139).

The underlying premises of democratic theory – in its liberal and radical guises – have, in short, been, that democracies can be treated as essentially self-contained units; that democracies are clearly demarcated one

from another; that change within democracies can be understood largely with reference to the internal structures and dynamics of national polities and that democratic politics is itself ultimately an expression of the interplay between forces operating within the nation-state.

Held traces the root of these problems to the two assumptions all 19th and 20th century social theory makes. First, that formally sovereign nation-states are autonomous states. That is, a state which has the undisputed right to determine rules, regulations and policies within a given territory can actually execute this right autonomously without constraints from any other nation-state or a system of states. Second, democratic theory assumes the processes and institutions of democracy to evolve from and function within the framework of individual nations. That is, a government ruled by the consent of the majority of its own citizens and is accountable only to them.

Both these assumptions are no longer valid in today's world which is marked by a high degree of internationalisation of production, consumption and finance (all of which are undergirded by advanced technologies of communication and transport). In this world, formally sovereign states cannot be assumed to be autonomous states. Globalisation of economic relationships has altered the possibility of deploying whole ranges of economic policy. As we discussed above in the context of Lindblom's idea of hybrid control, as the key economic factors such as the levels of investment, revenue and employment within a country become dependent on the decisions of transnational corporations and/or banks, governments can no longer intervene and manage their economies. Thus, as David Held puts it, "with the increase in global interconnectedness, the number of political instruments available to governments and effectiveness of particular instruments shows a marked tendency to decline". This is attributed to the loss of a wide range of border controls which served to restrict transactions in goods and services, production factors (including capital and technology), ideas and cultural interchange.¹⁹

The obverse side of this shirking of policy options at the national level is the growth of international policy-making options. The traditional domains of state activity – the very basic functions of economic management for capital accumulation – cannot be fulfilled without resort to international forms of collaboration. The rapid growth of transnational links is evidenced in the vast array of international regimes and organisations which have been established to manage whole areas of transnational activity (trade, space, the oceans, and so on).²⁰ Some of these organisations serve largely technical interests (e.g., the Universal Postal Union, the International Tele-

communications Union, etc). But other international bodies like the International Monetary Fund (IMF), the World Bank (WB) and many development agencies of the UN are involved in more contentious issues of allocation of resources and setting the rules of the global order. Participation of nation-states in these international organisations has brought with it new constraints on the autonomy of formally sovereign states. Indeed, as David Held proposes, the idea of sovereignty itself has to be conceived today as divided among a number of agencies – national, regional and international. Overall, there is no doubt that.

Global processes have moved politics a long way from activity which simply crystallises first and foremost around state and interstate concerns. [They are] blurring the boundaries of domestic politics, transforming the conditions of political decision-making; changing the institutional and organisational context of national politics; altering the legal framework and administrative practices of governments; and obscuring the lines of responsibility and accountability of national states themselves. From these processes alone one can say that *the operation of states in an ever more complex international system both limits their autonomy and infringes ever more upon their sovereignty* [Held 1991:157; emphasis in original].

Accordingly, the meaning and place of democracy – the second assumption of democratic theory – has to be rethought. For instance, in a world where the actions of a national government affect not only its own citizens but citizens of the other parts of the world as well, what should be the nation-states' relevant constituency for consent and accountability? Should the constituency be local, national, regional or international? Generally, territorial boundaries are insufficient grounds for inclusion and exclusion of individuals in participation in decisions affecting their lives. Indeed, globalisation raises profound questions not just about participation but about all key ideas of democratic thought: the nature of a constituency, the meaning of accountability, the proper form and scope of political participation, etc.

But here we are more concerned with specifics of how transnationalisation actually affects state policy-making powers and abilities, especially as these policies affect the agricultural sectors in third world countries. Two general statements about this phenomenon will suffice for now.

First, the mechanism and manner of transnationalisation – and the potential for destabilisation it entails – is not the same for all states but varies with the differential power the states have in the world economy. As Cox points out, the transnationalising of the third world state is "more openly induced by external pressures than the internationalising of the advanced capitalist state is" (1987:265),

and thus provokes more awareness and resentment (e.g., against the US and the IMF and the World Bank which are assumed to be acting on the US' behest). In the advanced countries, on the other hand, internationalisation has the appearance of being the result of ineluctable impersonal forces. Thus, there are bigger chances that this process will generate deeper opposition and political upheaval in third world countries than in the more advanced capitalist economies.

Second, the powers that transnational financial structures acquired in response to the debt crisis have diminished the autonomy of third world states severely. External debt has been singled out by political theorists as the most pervasive pressure on third world states to expand exports to earn foreign exchange. IMF and World Bank adjustment lending programmes not only curtail public investment in local production, but also change the very policy-making apparatus in third world countries – representatives of the multilateral and trade institutions (IMF, World Bank and lately, institutions like Inter-American Development Bank) actually sit in the state policy-making bodies [McMichael and Myhre 1991].

In conclusion, the nation-state seems to be yielding its primacy of place as a political mediator and an agent of capital accumulation. In its stead, the institutions and mechanisms of the global regime are setting the terms of economic policy. The state acts more as a facilitator of the requirements of global, rather than the national, capital.

IV

Transnationalisation of Third World States and Undoing of Green Revolution

Earlier in this paper the green revolution is presented as belonging to an era of economic nationalism, and it is suggested that the NACs represent an undoing of that era. It is time now to examine how this undoing has come about. Specifically, this section aims to examine the changes in the agricultural policies of selected NACs which have restructured their agricultural sectors from the goal of national self-sufficiency in food production to the goal of increasing export earnings.

But before we examine the content of specific policies, it will be useful to place the green revolution in the ideological and institutional context of its time. The idea behind the green revolution – deliberate and planned state involvement, with help from international agencies, in the creation of national and international institutions capable of doing research and providing extension services to farmers – was fairly novel when it was first seriously considered in the post-second world war years.²¹ The newly constituted Food and Agriculture Organisation (FAO) did not see any need to

sponsor additional research in high yielding seeds adapted to the local conditions of developing countries. The conventional wisdom at that time was that lagging agricultural development in the newly-independent developing countries could be corrected by a diffusion of already existing technologies from the industrially advanced countries [Hayami and Ruttan 1985: 264].

This view changed by the late 1950s as the limitations of the diffusion model became evident and serious food crises developed in many parts of Asia, especially India. Also, around that time, the agricultural science programmes of the Ford Foundation (in the Philippines) and Rockefeller Foundation (in Mexico), aimed at training local scientists in breeding high yielding varieties of food crops, began to show promise. The two foundations, along with the 'host' governments, set up the International Rice Research Institute in Manila in 1959, and the International Centre for the Improvement of Maize and Wheat (CIMMYT) in Mexico in 1963. In early 1950, the government of India formally requested the Rockefeller Foundation for help in developing hybrid corn in India. It was these developments that led the FAO and other international organisations (including the World Bank, the UN Development Programme) and nine national governments (led by the US) to organise the Consultative Group on International Agriculture (CGIAR) in 1971. By 1984, CGIAR was spending \$180 million annually on 10 International Agricultural Research Centres (IARCs) and three research-related programmes [see Hayami and Ruttan, ch 9 for a history of IARCs].

While legions of radical critics of the green revolution have endlessly laid bare the self-interest (control of indigenous germplasm and access to third world markets in seeds and farm chemicals)²² that motivated the US government and foundations to take a lead in the green revolution, these critics have paid very little attention to the other significant partners in this phase of agricultural modernisation – the third world governments themselves. In order to get a fuller idea of the developmentalist and nation-state centred ideas about modernisation prevalent at that time, it is important to open the black box of national agricultural policies.

That is precisely what a 1989 paper by Uma Lele and Arthur Goldsmith does for the green revolution in India. Their study of the internal documents of the Rockefeller Foundation and key ministries of the government of India reveals the extent to which the green revolution was a part of the overall project of nation-building. Nearly a decade before India was forced by a major food crisis (the 1965 drought) to appeal to the Rockefeller Foundation and the US government for technical assistance in trying out high yielding varieties of wheat and rice, the Indian government had been working

with US scientists and educators in reorganising its agricultural research and education systems. The Indian government's emphasis, which was shared by its American collaborators,²³ was on building institutional infrastructure for research suited for local crops and local farming conditions. According to Lele and Goldsmith, India fared a lot better (as compared to other third world states, especially in Africa) in becoming self-sufficient in food, because in India agricultural modernisation was a part of larger "nationally determined goals of development as opposed to *ad hoc* projects formulated on an individual basis" (1989:323).

This is precisely the point. For a brief period beginning at the end of second world war and ending with the onset of the debt crisis,²⁴ the idea of 'national development' was conceivable. The ideal conditions for development were those elaborated within the framework of the states, which were supposed to be accountable to both their people and to the institutions of the world economy created at Bretton Woods [Cox 1987:255]. The justification for such an arrangement was provided by Keynesian economics, which showed how national regulation of demand and supply could work.

Moreover, the very idea of development was quite novel. Historically, international trade – be it in raw material and slaves as under colonialism, or in cheaper goods made by poorly paid workers today – has been based upon comparative advantage in supposedly immutable factors such as climate, natural endowments, abundance of labour, etc. The idea of development meant a belief that these 'endowments' were not fixed by nature but were instead 'arbitrary' [Gilpin 1987:223] and could be changed by appropriate national policies. Thus the green revolution was an implicit statement of a belief that the third world could reverse its 'comparative advantage' as a producer of raw materials and luxury foods (tea, coffee, cocoa, etc) for the advanced nations, and could again become self-sufficient in food production (as it was in pre-colonial times).

The 'undoing' of the green revolution, a phenomenon this paper has tried to describe and explain, has come about as a result of an exhaustion of the twin ideas of national development and the arbitrary – and alterable – nature of comparative advantage of nations.²⁵ The assumption underlying Bretton Woods – that nation-states could be accountable to both international financial institutions and to their citizens without any conflict of interest – has proven to be unworkable. Changes in the world economy (described in Section II) have led to a return to the doctrine of free trade based on the old notions of comparative advantage. The GATT treaty represents a triumph of these ideas.

In many third world countries, especially those with bigger debt burdens, global rather than national economic regulation is

becoming the norm and is increasingly enforced by international financial institutions like the IMF and the World Bank. Thus McMichael (1992a) reports that structural adjustment loans to third world debtors has forced a diminution of programme-oriented ministries (social services, agriculture, education, etc) as compared to trade and finance ministries. These ministries treat agriculture as one more source of increasing export earnings rather than as a source of need satisfaction of the populace. The new agricultural policies being promoted by the more export oriented states are devoid of a broader rural development – and equity – agenda that used to be a part of the official rhetoric of the green revolution.

This new institutional and ideological arrangement has led to three kinds of policy changes: (a) economic subsidies to food exports, (b) substitution of contract farming for extension services, and (c) increased involvement of the private sector in development and deployment of agricultural technologies. We now proceed to examine these in detail.

STATE SUPPORT FOR EXPORT AGRICULTURE

Like their counterparts in the advanced capitalist countries, governments in the third world have traditionally used price support to farmers and subsidies for infrastructure (irrigation, roads, farm chemicals, etc) as a means of encouraging the use of new seeds and farm technologies. These policies paid rich dividends through the green revolution years, but are now under threat from the IMF's structural adjustment policies and the free trade policies written into the GATT.

Mexico is a striking example of this unravelling. As David Barkin (1987) tells it, until the mid-1960s, there appeared to be a happy coincidence between the two criteria of needs and profitability in rural Mexico. The first advances of the green revolution (which had its origin in Mexico in the mid-1940s), coupled with land reform, led to spectacular gains in yields in wheat and maize in irrigated areas. Starting in the mid-1960s, the US markets for Mexican exports of cattle, cattle feed and fresh fruit and vegetables began to grow. Mexico also saw a growing domestic market for 'durable foods' catering to more upscale consumers. Both Barkin and McMichael (1993) conclude that the Mexican government tailored its economic policies (especially investments in irrigation and farm chemicals) to encourage crops destined for export markets. Those farmers who could find the resources to modify their operations stopped producing foodgrains and other traditional crops and instead planted on the basis of profitability alone. Consequently, sorghum, virtually unknown in Mexico in the 1950s, became the country's number one cash crop less than two years later. The state could have made food production equally or more profitable,

but it failed to increase the support prices for small-scale agriculture, the primary producer of traditional products. Indeed, in order to keep down the consumer price of food, the procurement price of food fell lower, making commercial farming for nonfood products even more attractive. The government made up the shortfall in food through imports, leading to the absurd situation reported by Barkin – the country was exporting increasing amounts of agricultural products, and at the same time, using those export dollars to buy food. Even though in this pre-debt crisis phase the Mexican government favoured large-scale and export-oriented sectors over the more traditional farm sectors, it maintained its legitimacy among the impoverished by large-scale subsidies for basic food items for the urban population and loans and marketing support for small farmers.

For a short span of time (between 1980 and 1982) Mexico tried to reverse its dependence on imported food – and gave a real world example of what economic policies work for self-sufficiency. Discontent among small holders in rural Mexico, coupled with a drought in 1979, led the government to formulate a plan to recover its lost self-sufficiency in food. Two programmes were launched in quick succession, the Sistema Alimentario Mexicano (SAM) from 1980 to 1982 and the Programa Nacional de Alimentación (PRONAL), which replaced SAM in 1983. Both aimed at increasing production in small-scale dryland agriculture, increasing rural employment and improving nutrition [see Barkin 1987 for details].

The remarkable success of SAM gave a clear example of what the state could potentially do to improve the economic status of small farmers. Funded generously through petroleum money, SAM increased the producer prices for basic food, extended low-interest credits for food production and subsidised farm inputs (especially cheap seeds and fertilisers). The results were striking and immediate, in the three-year period from 1980 to 1982, agriculture grew at 5.2 per cent as compared to 2.8 per cent during the 1977-79 period. Grain output increased significantly through the reincorporation of land into cultivation and through subsidised inputs. Staple foods – corn, beans and rice – all showed a marked increase. A significant improvement in availability of food to the rural poor was also reported. SAM ended in 1982 (due to a change in the administration, apart from other problems) and was followed by PRONAL, which sought to improve the infrastructure for dryland farming [Barkin 1987].

But the deepening debt crisis of 1982 brought these programmes to an abrupt halt. In 1986, the World Bank began negotiating with the Mexican government to develop a structural adjustment loan that was conditional on the elimination of food

subsidies, privatisation of state agencies, domestic agricultural price liberalisation (i.e., withdrawal of price supports), input price liberalisation (i.e., end to subsidies) and streamlining of the agricultural ministry through mass dismissal of employees. As one indication of the state's withdrawal from the countryside, state investment in 1986 was 47 per cent less than it was during 1981 (when SAM was at its peak) [Raynolds et al 1993].

Thus, as compared to the green revolution years (roughly, from the late 1940s through the middle 1960s) and even the early phases of Mexico's integration into global agro-industry, the current agricultural policies – the 'new' agriculture, as this paper has described it – have seen a diminution of the national development component in favour of global markets. As Raynolds et al (1993) aptly put it, "the state's policies have shifted from building a domestic agro-food complex with a strong export component into exploiting agriculture for generalised fiscal stability". The real losers in this shift are the peasants and small commercial farmers who have been left to fend for themselves in a volatile world market. Indeed, the roots of the Indian rebellion in the state of Chiapas earlier this year can be traced to the social instability and inequity caused by the operation of the unregulated market [Burbach 1994].

This shift is not unique to Mexico. The Dominican Republic has undergone almost identical changes as described for Mexico, with the essential difference that the latter has always been more closely integrated into the world economy. The Dominican Republic's economy has been dominated for centuries by the production of sugar, and to a lesser extent, coffee, cocoa and tobacco, for sale in European and North American markets. Collapse of the sugar export market (in large part due to technological substitution, see Section II) has forced country to aggressively promote non-traditional markets²⁶ as it seeks to make structural adjustments under the supervision of multilateral financial institutions. Like its counterpart in Mexico, the national government has been forced to withdraw state support for local food production. But the Dominican Republic has gone much farther in explicitly supporting the new exports of fresh produce – the state has made nearly 10,000 hectares of state-owned land available to foreign agribusiness (including the US-based TNCs, Chiquita and Dole) on a concessional basis to cultivate pineapples for export. This land lease is supported and funded by the US Agency for International Development through the sugar diversification programme [Raynolds 1994]. Moreover, the multilateral agencies (including the Inter-American Development Bank) also have made structural adjustment loans available to the government to provide tax

cuts and state-subsidised credits to non-traditional agricultural exporters. The 'free' market ideology that underpins the export-led growth of the Dominican Republic (and other NACs) does not by any means imply substitution of the state by market mechanisms, but actually the deployment of state policies to serve the international market.

Similar restructuring of policies is occurring in many other countries, including Ghana in Africa [Tripps 1993] and India [Gill 1988, 1990].²⁷ These changes may differ in details but they share the logic described here for Mexico and the Dominican Republic.

CONTRACT FARMING

Most successful experiments in the green revolution seem to be the result of two national policies: (a) development of crop varieties consonant with local environmental conditions, social tastes and resources, and (b) provision of financial and technical support to the growers through extension services [Lele and Goldsmith 1989 for India, and Tripp 1993 for Ghana]. With the growing market orientation of agriculture, the governments in the NACs are ceding these crucial policy arenas to internationalised agro-industry, which is bringing the practice of contract farming to the countryside in third world countries. In this mode of production, the contracting firm provides all those services and inputs – seeds and farm chemicals, financing and marketing – that the state-run agencies used to provide at a subsidised price.

Contract farming is a way to integrate independent growers into new production complexes. It is a form of social organisation in which

plants and animals are produced on land in relation to the complex and changing profit conditions of global competition – it is a means to introduce distinctive work routines, new on-farm technologies and labour processes, a further concentration of capital in agro-food systems and not least, *to deepen the form of appropriation by which rural production processes are converted into industrial products by agro-industrial capital* [Watts 1990: 149, emphasis added].

Lately, contract farming has been heavily promoted by multilateral financial bodies and major international aid agencies, including USAID and the British Commonwealth Development Corporation. The latter, in conjunction with the World Bank, has pioneered palm oil, cocoa and rubber contracting across Asia, Africa and Latin America. USAID, as we saw in the case of Dominican Republic, has supported TNC-managed contract farming. But such operations are not limited to private contractors – state-run agencies can and do serve as contractors as well, as in the case of tea production in Kenya, tobacco and livestock in Thailand, rubber in Malaysia and palm oil in the Philippines (all examples are from Watts 1990). Third world govern-

ments, Watts claims, are very attracted to contract farming for it helps them retreat from the countryside, while at the same time, maintain the nationalistic rhetoric of 'putting peasants first'

Contract farming involving transnational capital is most advanced in Central and Latin America. The import substitution policies of Latin American countries in effect invited TNCs to invest in these countries (in order to avoid tariff barriers), and the agribusiness investment has grown through integrating the producers into their operations through contract farming. In Mexico, for instance, Pillsbury, Campbell Soup, General Foods and other North American TNCs have been contracting for strawberries, tobacco, tomatoes and cocoa since the 1950s. Many others (Chiquita and Dole) operated banana and sugar cane plantations [Friedland 1994]. With the intensification of agricultural exports in recent years, production relations modelled after the old fashioned plantations system have re-emerged – in the Dominican Republic, for instance, large TNCs hire workers to cultivate land managed by the company (and leased from the state for a percentage of the profits). This arrangement leaves the corporation in complete control of the production and supply of produce. Other forms of contract farming resemble the old 'putting out' system of industrial production in which businesses contract a large number of peasant growers to produce the desired crop. In this model, too, businesses control the quantity, quality, credit, inputs, production method and market access.

Arrangements like these are not uncommon in other parts of the third world. Small peasants contracting with local merchants of joint ventures between local and foreign merchants and exporters is becoming a common phenomenon. There are well-established networks of local peasants in Kenya who produce sugar, tea, tobacco and fresh fruit and vegetables under contract to state and private contractors, with only 100 Kenyan buyers-processors exporting carnations and specialty vegetables to London, and green beans to Paris. Senegal, too, is an exporter of fresh produce. According to Watts, the majority of Kenyan contract farmers are women. In Asia, Thailand's food exports are largely based on rural small holders under contract to the agro-food processors [McMichael and Myhre 1991]. India has recently allowed a joint venture between PepsiCo and two Indian corporations (one state-run and another privately owned) to begin contracting peasants in the state of Punjab to grow vegetables for processing [Chakravarty 1989].

Contract farming in Sanderson's (1985) opinion "denationalises" production by shifting the locus of control away from the farm toward the agro-industrial enterprise. Crucial decisions about what to produce and how much are settled by fluctuations of

world commodity markets, rather than by either national plans or domestic markets. Not surprisingly, regulation of food quality – food safety, pesticide residues, physical appearance, processing qualities, etc – also passes out of the hands of local government agencies. There are many cases of produce not being allowed into the importing countries because of failure to meet those countries' environmental standards. In such situations, the contracting firms simply suspend purchase, leaving the farmers with their stock of perishable produce [see Raynolds 1994 and Watts 1990 for examples].

Apart from these disarticulations of production and regulation from the local base, contract farming has serious implications for technology choices. Evidence shows that it is quite likely that contract farming will simply become a conduit for new technologies which will be outside any meaningful government control. Most, though not all, contracts allow the contractor to lay down specifics of production practices. These companies are allowed to supply the farmers with their own seeds and inputs. For instance, PepsiCo in India declared the local tomato varieties to be unsuited for its processing operation. It was allowed to distribute imported germplasm to 107 local farmers who cultivated 1,600 hectares of land with it [Gill 1990]. Pepsi, moreover, has plans to set up a plant research centre to develop new varieties better suited to the local climate – and to its own specifications.

Provision of seeds, chemicals, and technical advice to farmers about how to use them – all these functions that agribusiness is permitted under contract farming – have been the traditional mainstay of adaptive research and extension services. Although general opinion has swung against the public sector's involvement in agricultural research, the fact remains that extension services have many success stories. Even the harshest critics of national and international research centres set up during the green revolution have come to accept that they have been responsive to local ecological conditions and food needs. Patient and long-term involvement of extension services has led to widespread adoption of green revolution seeds and inputs even by small farmers [Tripp 1993]. Although it cannot be denied that richer farmers tend to monopolise the government-run credit and extension services, the fact remains that these services were mandated to help all farmers, regardless of the size of holding. Contract farming operates under no such mandate. Contractors are free to select only the more viable, generally richer and already well-established farmers [Watts 1990]. The poorer farmers can make no claims on these private sector services. As a result, there is a real danger that as national governments let the market take care of extension services, there may be nothing left of them for the farmers who need them the most.

CHANGING DIVISION OF LABOUR IN PLANT BIOTECHNOLOGY RESEARCH

Breakthroughs in agricultural biotechnology have intensified the struggle between private and public sector research institutions over the division of labour between so-called basic and applied research. According to Kloppenberg's political economy of the development of the private hybrid seed industry in the US [Kloppenber 1988], at those historical junctures when new technical innovations make commodification of seeds easier, private industry has sought to limit the activities of scientists in public research centres to doing 'basic' research only. The first phase of marginalisation of public sector scientists (in land grant universities) came in the 1930s when it became possible to hybridise corn, and the second big push to sideline – or co-opt – research in public institutions has been in progress since advances in biotechnology made genetically engineered seeds a possibility.

A similar redefinition of the division of labour has also begun internationally. As Buttel and his colleagues expressed the problem:

the technological pivot of international agriculture and rural development is in the process of being superseded by new technical forms that will significantly change the context within which technological change in the Third World is conceptualised and planned. The cluster of emergent techniques generically known as 'biotechnology' will be to the Green Revolution what the Green Revolution was to traditional plant varieties and practices [Buttel et al 1985: 32].

As suggested at the beginning of this section, the green revolution was set in motion through a collaboration between international research institutions and national governments which set up their own research centres and extension services. Whatever shape this collaboration took in different countries, the defining feature of the green revolution was that it was in the public domain. This is not to say that private interests, particularly agrochemical transnationals, did not benefit from the spread of the green revolution, for clearly they did. But private corporations did not themselves spearhead the green revolution or have a determinate role in the shaping of research priorities. Indeed, it is fair to assert that the dislocations stimulated by the inequitable deployment of green revolution technologies could have been worse had IARCs not been committed to a mission-oriented ideology of 'public interest'.

Moreover, the main technology used in the green revolution – plant breeding – was developed by public sector institutions in the west and successfully adapted by national research institutions in several third world countries. Buttel summarises the situation:

Due to foreign aid, training and research efforts from multilateral institutions such as

the United Nations' FAO and International Agricultural Research Centres (IARCs) and Third World government investments in personnel training, facilities and research programmes, a significant number of countries (especially India, Brazil, Mexico and China) developed the capacity to undertake some basic research and virtually all the types of applied agricultural research then being undertaken in the advanced countries. Tens of others had sufficient capacity to modify and transfer new technologies developed by IARCs or developed country research in states. Even some of the poor countries of the so-called Fourth World (e.g., Bangladesh) were able to make use of public-domain technologies developed elsewhere, with a modest amount of technical assistance from more favoured nations and multilateral research institutes [Buttel 1990:164].

The private sector largely stayed out of the development of green revolution seed varieties because it was not very profitable. Despite many attempts, the major seeds of the green revolution – wheat and rice, the staple foods in most of the third world – could not be successfully hybridised. Lack of hybridisation meant that these seeds could not be sold as proprietary brands which would have to be bought afresh every year.

All that is now changing. Biotechnology has provided the private sector with a powerful tool to commercialise seeds. This has already led to a big move of agricultural research "from the campus to the corporation" [Kloppenbergh 1988:220] in the industrialised countries. The growth of plant biotechnology has seen big takeovers of private seed companies by giant chemical and pharmaceutical companies (which see seeds as delivery systems for their herbicides and other chemicals) and an attempt to co-opt university scientists through offers of research grants and/or shares in biotechnology firms. In the US there are many state- and business-sponsored initiatives, like the one based on the Winrock Report, which seek to limit the land grant universities and other publicly funded research centres to basic research, which can be used by the private sector to produce marketable farm inputs [Kloppenbergh 1988].

A parallel process is under way in international agricultural research. IARCs, the institutes that spearheaded the green revolution, are being left out of the impending bio-revolution. They are no longer as generously funded as they used to be. According to Buttel and his colleagues (1985), funding for IARCs fell short of inflation by 6 per cent and virtually all 13 IARCs were forced to cut back their programmes. Indeed, recent evidence suggests that international aid agencies have started funding major private sector biotechnology firms to train third world scientists and to develop products for third world markets – functions which

used to be performed by IARCs. For instance, *Business Week* (1992) recently reported that at the behest of foreign aid donors, western companies, including Monsanto, Britain's Imperial Chemical Industries (ICI) and New Jersey-based DNA Plant Technology, have started programmes to train scientists from third world nations. Furthermore, USAID has given contracts to the US unit of Britain's ICI to develop insect-resistant corn for Indonesia and to DNA Plant Technology to train Costa Rican and Indonesian biotechnology companies in high volume cloning of tropical crops. Both efforts include US training for scientists from those countries. The US companies, moreover, retain rights or royalties to any commercial products that may come out of this collaboration.

At the national level in many third world countries, the public sector is in the process of being sidelined out of plant biotechnology. In countries such as India which have the capital and scientific personnel to undertake research in this area, there is a proliferation of local biotechnology firms operating alone or in joint ventures with foreign companies. In poorer and less well-equipped third world countries, the national governments, under pressure from foreign aid donors, are retrenching from publicly funded research centres and favouring the non-profit sector.

Recent news reports from India suggest that the social division of labour between private and public research institutions has already tilted toward the former. One major growth industry is tissue culture of commercially profitable plants, including exotic flowers, high yielding varieties of bananas and export products like cardamom [McDonnell 1993]. Big names in Indian industry are teaming up with foreign corporations (e.g., India's Tata industrial group with Tera Nigra, a cut-flower company from the Netherlands) to propagate large numbers of plantlets from tissue culture. India already supplies 10 per cent of the world's tissue-culture capability.

In a process reminiscent of privatisation of seed research in the US described by Kloppenbergh, the Indian government has begun to play the role of facilitator of private research initiatives. Instead of directly funding research, the government-run department of biotechnology helps states to initiate programmes to attract biotechnology entrepreneurs. Under DBT's guidance, one state (Kerala) has already set up the country's first 'biotech park', where the state provides the land, water, electricity and institutional back-up for entrepreneurs who have the skills but not the resources to set up a biotechnology firm [Abreu 1994]. Again, in a process that bears a striking similarity to that described by Kloppenbergh for the US, Indian-owned and joint venture biotechnology firms are beginning to use the public universities and research institutions as sources of trained

personnel for the many new growth areas in biotechnology, including, apart from tissue culture, enzyme production, production of bio-pesticides and bio-fertilisers, and diagnostics. While the budgetary figures are not available, it appears that as part of an overall market-orientation, the Indian government is steadily moving away from commitment to public research institutions.

Other third world countries are under increasing pressure from foreign donors and lending institutions to retract from nationally funded research. Tripp (1993) describes how the government of Ghana, facing budgetary pressures, has been forced to abandon a fairly successful state-run programme for popularising high-yielding corn to the peasants. Ghana's foreign donors and debtors have instead encouraged the growth of non-governmental organisations which are often not as efficient or as patient as have been the government programmes. In both cases, the result is an unravelling of national efforts to build research and development capabilities in favour of less equitable arrangements and – that does not bode well for the poor.

V

Conclusions

The main thrust of this paper is to argue for a reconceptualisation of the role of the state in policy-making in the context of the growing transnationalisation of the economy. It is further argued here that because of their relative lack of power in the world economy, third world states face an additional set of constraints on policy-making, namely, the pressure from multilateral financial institutions to retrench from protecting domestic markets, and to stop taking an active role in development projects that support the poorer sections of society. The reigning ideology propagated by multilateral banks and foreign donors, and embraced quite actively by third world elites, is to integrate more fully into the world market through more exports and more foreign investment. The only concern of the state which is not considered illegitimate, it seems, is to intervene on the behalf of the private enterprise, foreign and domestic, often in joint ventures.

This 'post-developmental' state is actively dismantling the institutions and capabilities that the third world had built up under the green revolution during the heyday of developmentalism. This paper describes the emergence of the 'new agriculture' which is export-based and vertically integrated with transnational agro-food industry. An attempt was made to delineate three policy arenas which have contributed to the new export-orientation at the cost of larger development goals which were part of the green revolution.

While there were problems with the green revolution, at least during the early phases

when the smaller peasants were left out, it was still a programme within the public domain and was mandated to be accessible to all. The green revolution, furthermore, was linked to developing the institutional capacity to provide for local food needs. What is replacing this project is not a more democratic, more participatory agricultural policy but the impersonal, faceless corporations which span the whole world. Any sense of tradition or local community has no chance of surviving the onslaught of transnational capital which is beginning to penetrate peasant-based farming.

This paper has only described and analysed a very grim situation. What are the solutions? Apart from suggesting that the public sphere needs to be strengthened and democratised, this paper has no concrete answers. The problem is simply too complex and overwhelming to be resolved here. Another paper, some other day, will perhaps have some more hopeful answers.

Notes

- 1 The term 'third world' is loaded with ideological and hierarchical connotations. In this paper it is used merely as a shorthand for countries that gained independence from colonial domination in the middle of this century and embarked upon programmes of economic development on the national level.
- 2 Third world states are not alone in feeling the impact of globalisation. The recent obsession of US businesses and government with 'national competitiveness' is a result of changes in the world economy, in which the US is becoming only one among many big players. For a critique of making competitiveness "the organising principle of a new national economic strategy", see *The 21st Century Project* (1993).
- 3 Debates on farm policies of industrialised countries dominated the recent General Agreement on Tariffs and Trade (GATT) negotiations. Despite its obvious importance, this paper will refer to GATT only insofar as it helps to illuminate the larger phenomenon of transnationalisation of policy-making. One reason for this relative neglect in this paper is that GATT applies more directly to exchange and trade relations and not so much to actual production itself. How changes in national policies shape relations of production themselves is the major focus of this paper.
- 4 Popularised (and perhaps coined) by Harnett Friedmann (1993), the label 'New Agricultural Countries' is supposed to be a counterpart of the NICs, the 'New Industrialised Countries'. 'New Agriculture' refers to the fact that it is geared to a world market in high-value foods and feed grains. New also means 'non-traditional' exports as compared to the primary exports under colonialism (e.g. sugar, cotton, coffee, bananas).
- 5 Food regime implies a "rule governed structure of production and consumption of food on a world scale" [Friedmann 1993: 30].
- 6 It is not clear, however, if Pepsi's operation is aimed at export. Under the agreement Pepsi

signed with the Indian government, it is required to bring in \$ 5 in exports for every dollar it makes through selling Pepsi Cola in India. This may well encourage the sale of processed vegetables abroad, but the huge middle class market in India is an attractive option as well.

- 7 By 1990, Chiquita had established more than 240 subsidiaries in fruit and vegetable markets in 14 countries while Dole had some 37 subsidiaries in 15 countries. Both were involved in actual production of these products through contract farming and joint ventures with either private capital or with the state in third world countries [Friedland 1993].
- 8 This phenomenon is described by Jeremy Rifkin (1992) as creation of the 'world steer', a bovine analogue of the 'world car'. The idea is to create a single world market for beef. To satisfy the market, "multinationals are beginning to assemble cattle the way they assemble cars, bringing together inputs: seeds, grains, pharmaceuticals, cattle embryos, cattle automated slaughtering, wholesale marketing and retail distribution - from various countries into a single co-ordinated operation" (p. 148).
- 9 Suggested by McMichael (1993: 351). But he does not use this idea to develop a historical explanation of how the green revolution is being undermined by internationalisation. This paper seeks to provide such an explanation.
- 10 World economy in contrast to an international economy: "where the international economy model focuses on exchange, the world economy model focuses on production. It consists of transnational production organisations whose component elements are located in different territorial jurisdictions" [Cox 1987: 244].
- 11 This is not to deny that there was a substantial international involvement of international foundations and even transnational capital (especially in fertiliser and pesticide markets). But, as will be discussed in more detail later, public sector institutions retained control of the overall direction and pace of the green revolution.
- 12 The New Deal farm support policies are an instance of macro-economic policy as a tool for science and technology policy. By providing an assured income to the farmers, farm policies created a market for (and encouraged further research in) technical innovations ranging from tractors and hybridised maize to chemical inputs, all of which made their debut between 1910 and 1930. Thus "the farmer became a productive consumer of industrial inputs that came from the factories and laboratories of Fordism" [simultaneously] all farm production outputs became commodified as inputs into other Fordist industries" [Kenny et al 1991: 184-85].
- 13 Otherwise fairly persuasive, Friedmann fails to explain why the US should have supported the green revolution in third world countries at a time when PL480 was at a peak. Modernisation of third world agriculture would have only closed this outlet for US grain reserves.
- 14 As Friedmann (1991) describes it, "what is wanted is not sugar, but sweeteners; not flour or cornstarch, but thickeners, not palm oil or butter, but fats, not beef or cod, but protein".

15 Most of those belonging to the 'New International Division of Labour' especially as applied to industrial production, fall in this camp, as do many third world critics of modernisation (For a notably virulent example, see Shiva). Even judicious critics of the green revolution like Kloppenborg (1988) treat individual national governments as autonomous agents of capital accumulation, which relate to international issues only to strike the best deals for the elite interests in their own nations.

16 Thus we find the Carnegie Commission recommending that science and policies should "integrate national and international views" [Carnegie Commission 1992]. In a similar vein, the authors of the 21st Century Project report exhort scientists to "think of themselves as global citizens", with a responsibility toward the new global community (p. 2). These recommendations are not wrong *per se*, but only superficial and trite. They fail to recognise the extent to which the 'national' has already become 'international'. Thus to think globally is not a choice but an imperative.

17 In order not to dignify the existing systems of governments in market-oriented societies as democracies (which assume an active and deliberative public participation), Lindblom calls them 'polyarchies', signifying only that the "social machinery for the control of authority", in these societies is run by 'many' who follow "a set of authoritative rules" (1977: 132).

Lindblom describes the involvement of businesses in policy making as follows: "... in any private system, a large category of major decisions is turned over to businessmen, both small and large. They are taken off the agenda of the government. Businessmen thus become a kind of public official and exercise what on the broad view of their role, are public functions. The significant logical consequence of this for polyarchy is that a broad area of public decision-making is removed from polyarchal control" (p. 172).

18 "Governments might take on the meticulous task of designing a highly discriminating mixture of financial inducements to business with governmental controls over them. It is a particular way of creating a hybrid form of market and polyarchal control. The key strategy is, in effect, to pay businesses to waive some of their privileges" [Lindblom 1977: 349].

19 One of the reasons why Keynesian policies do not work today is that it is much harder for individual governments to intervene and manage their economies faced with global divisions of labour and monetary system. For example, a tax break to consumers with an idea of creating a market for a certain product can no longer ensure that the demand for locally made products will go up and create more jobs, or that research and development of a product at home may not end up benefiting other countries (through production investments of TNCs).

20 Sol Picciotto (1990) describes a mushrooming of international organisations. In 1914 about 50 formal intergovernmental organisations had been created, in 1939 there were perhaps 80, and by 1980 over 600. Picciotto suggests that these institutions have

played a major part in ensuring a minimum degree of state co-ordination needed to permit international reproduction of capital

- 21 State involvement in agricultural development and even centralised seed research is not new, though. In the west, Germany first started publicly supported agricultural research in 1852 with an explicit plan for "catching up" with Britain. The German concept of socialised agricultural research was transplanted to the US. In the east, China and Japan have traditions of deliberate, centralised seed improvement schemes dating back a few centuries [see Hayami and Ruttan 1985, ch 8]. But international collaboration through establishment of research centres was a new innovation
- 22 These critiques are too numerous. To mention only two: Kloppenberg (1988) suggests that the Rockefeller Foundation had an interest in creating a market for hybrid seeds in Latin America. "By 1946, Rockefeller interests had conducted a survey of the market potential for hybrid maize seed in Brazil and later that year their International Basic Economy Corporation invested heavily in the only hybrid-seed-producing firm in that country" (p 158). Another critic of the green revolution, Vandana Shiva, makes numerous unsubstantiated charges regarding American firms making profits selling seeds and farm chemicals to third world farmers
- 23 The Rockefeller Foundation for help with the development of the national research system, USAID for investment in land-grant type agricultural universities and the Ford Foundation for assistance with farm extension services [Lee and Goldsmith 1989]
- 24 This period coincides with the so-called Pax Americana, the period of US hegemony in the world which declined with the end of the Bretton Woods system of fixed exchange in 1973
- 25 Even though institutions like the IMF and World Bank continue to talk of development, they are closer to what Gilpin describes as a liberal position on comparative advantage, namely, that nations should design macro-economic policies to foster the basic factors for production (eg, technology, infrastructure, etc) and to leave commercial development to the market, including the world market
- 26 Mostly in tropical fruits, particularly melons, pineapples and avocados, fresh vegetables and horticultural crops, particularly peppers, tomatoes, green beans, etc, and tropical root crops like yucca and yams [Raynolds 1994]
- 27 In the case of India, PepsiCo will be involved in the cultivation and processing of fresh fruits and vegetables. Reversing the environmental problems created by a mono-culture of wheat and paddy and creation of an agro-industrial base in Punjab is the official rationale for diversification. The involvement of PepsiCo reflects more a general opening up of the Indian markets to foreign investors rather than an export-orientation of the food sector *per se* [Gill 1990]

Expectations, Macro-Foundations, Policy Ineffectiveness and Culture

A Methodological Detour

Abhay Pethe

An attempt has been made in this paper to critically – albeit briefly – look at the treatment of 'expectations' in mainstream economics. It is argued that RATEX in conjunction with new classical assumptions provide a heady mixture leading to many a nonsensical proposition. A novel way of looking at the micro-macro debate is also suggested. It is pointed out that in the context of modelling dynamic aspects, the crucial aspect of learning (culture constrained or otherwise) has been completely bypassed. The paper – to state the obvious – has been written in a methodological vein.

THE discipline of economics – unlike the case of natural sciences – does not progress by the process of sedimentation. As Robertson has noted, here the highbrow opinion is like the hunted hare, so that old masters and concerns come back, time and again, with renewed relevance. This also in a sense implies that there are no fundamental revolutions in economics, but only upheavals. It is a matter of time before the old corpus assimilates these upheavals in its fold, leading to a new plateau. This process of reconstruction and synthesis leaves in its wake a lot of rubble, which if not cleared, is detrimental to a clear appreciation of what has been achieved. It is in this context that the present exercise has been undertaken. The focus here is on rational expectations along with some new classical assumptions, which together have provided a heady mixture and have contributed in no mean way to 'that solemn and farcical muddle that is modern macro-economics'.

I begin by focusing on some of the high-points in the evolution of thinking on expectations culminating in the paradigm of rational expectations, which till the recent past ruled the roost. I then point out what I think are the major conceptual problems with the currently existing work. I then comment on the micro-macro debate, and issues of coherence and culture.

EARLY THINKING

Over the years, the role of expectations in macro-economic research has attained so much prominence that its importance can hardly be overemphasised.

The early 20th century economists such as Bagehot, Marshall and those a little later such as Pigou and Keynes were quite decisive about the effect of expectations on macro-economy though their treatment was far from sophisticated. For them the changes in expectations were exogenously given shifts which had major implications for the real economy. This contrasts very much with the more recent view of expectations as being

endogenous and having little or no impact on output. To the early masters changes in expectations were chiefly manifest in the often capricious movements in business confidence, though they did not rule out the impact of real factors. Thus, Pigou (1929) distinguished between the 'real' and 'psychological' components in expectations formation: "In the actual world, both sorts of causes are present. Moreover they react on one another."

The next important stop was Keynes' General Theory. His animal spirits argument [Keynes 1936] is too well known to need any elaboration. For him, the state of long-term expectations depended on exogenously given conventions. Shifts in conventions which lacked any real sound footing were referred to by Keynes as 'animal spirits'. Very often animal spirits are thought as being responsible for the shifts in expectations. On the contrary, in the General Theory, they are just by-products of the changes in conventional knowledge. The conventions themselves are the macro-economy's sociological response to systemic uncertainty [Lawson 1985]. Keynes' use of expectations in his celebrated liquidity preference theory has had to face the famous 'Cheshire cat's grin' or the 'bootstrap' criticism of Robertson. Indeed now what remains of the animal spirits argument can be found in the residual of the Keynesian investment function [Dow and Dow 1985]. In the not so mainstream economics, there were anticipations of this view of expectations in Marx's work as seen in the work of Sweezy and Kalecki amongst others. Both their views were influenced by Marx's ideas on expectations and his reproduction models [Wolff 1978 and Burkett 1989].

Let me elaborate a little on Keynes' world view, since he is after all one of the more important economists. Indeed, this is even more pertinent for, some economists including Joan Robinson consider the Keynesian revolution to be chiefly made up of his views on the role of expectations and his attempt to bring history into analysis.

Also, this will be important since it will provide a contrast to the Raxexians viewpoint. Now, Keynesian econometric practice was concerned with 'disequilibrium' in a fundamental sense. There was no presumption of a 'true' model that just needed to be identified. In fact, most Keynesians would deny that true structural models even exist for an economy (in the a priori sense), a view reinforced by recent research in sunspot models [Howitt and MacAfee 1992]. This view is also close to the position of the present paper. In the words of Keynes, "The object of our analysis is not to provide a machine, or method of blind manipulation which will provide infallible answer, but to provide ourselves with an organised and orderly method of thinking out particular problems; and after we have reached a particular provisional conclusion by isolating the complicated factors one by one we then have to go back on ourselves and allow, as well as we can, for the probable interaction of the factors among themselves. This is the nature of economic thinking. Any other method of applying our formal principles of thought (without which, however, we will be lost in the wood) will lead us into error [Keynes 1973]. Thus the Keynesian approach to econometric modelling looks for 'good' approximations. The theories are just approximations of the real world and are confronted with data to uncover statistical macro-economic regularities. Of course this method has an implicit possibility of proliferation of model representations and equations. This however is not looked upon as something undesirable, since it is believed that there is no one given and certain interpretation of truth. Forecasts are calculated as projections conditional upon particular data representations and the policy-related decision-making uses these forecasts simply as extra sources of information.

Keynesian views were treated in a dynamic context by Harrod (1939). He worked out an interplay between the warranted, the natural and the actual growth rates. Here expectations played a major role in deriving

the instability propositions. Of course, the agenda which Harrod set for himself – viz, that of providing the limbs of dynamic economic analysis – was rather more general. However all that was swept aside by the surgical neatness of Solow's growth model (1956). It is important to note that implicit in Solow's model is the assumption that all the expectations are always fulfilled. This makes nonsense of Harrod's knife edge equilibrium. On a more methodological level it points to the crucial importance of an appropriate modelling of expectations. What Solow had produced was a steady-state growth model. In none but the steady-state equilibrium models does the assumption of continuous fulfilment of expectations makes sense; indeed they are but equivalent ways of looking at the economy.

During the 50s, Hahn attempted to model expectations. "I was concerned to show that perfect foresight paths gave rise to 'forward dynamics' and would generally be ill-behaved if the 'backward dynamics' induced by expectations based on the past events led to stability" [Hahn 1990]. One can notice here the genesis of the recent literature on intertemporal inconsistency. This line of work, obviously not meant as an exercise in descriptive realism was taken up recently by Grandmont (1986), Marcat and Sargent (1988) among others. The reason for this long period of stupor is not difficult to see. The Arrow-Debreu formalism had introduced a world of completely collapsible future. Since time was not intrinsically essential to this model, expectations did not have much of a role to play here. However theoretical economists were seriously concerned about the fact that it allowed no scope or place for money to exist. This concern led to the revival of the study of expectations as a major theoretical problem. It is clear from the work of Radner (1969, 1971) and Hahn (1980) that for money to enter essentially and meaningfully into an economic model it would have to have a sequential structure. This implies that there must be trading at every date and the agent is faced with many budget constraints. The Patinkin-esque synthesis would not do since it was not clear as to why money should have a positive value in equilibrium. Indeed, as Hahn has pointed out, an autarkic solution with the exchange value of money equal to zero is quite compatible with the Patinkin framework rendering it rather useless for analysing monetary issues. That I am not in total agreement with this view will become apparent when I return to this theme a little later.

At a more applied level, direct surveys have been used to understand expectations. Klien (1954), Haavelmo (1958) and Katona (1958) had already initiated good work on direct survey expectations so that fancy models could not escape direct testing. Direct tests are especially popular in the realm of

inflationary expectations. Particularly notable are Chang-Lee (1980), Lahiri (1980), Visco (1984, 1986), Lovell (1981). Survey expectations are used for a variety of reasons as seen from Nerlove (1983), Kawasaki (1982, 1983) and McLutosh (1989) among others. An excellent survey of direct studies of expectations is to be found in Pesaran (1987, 1990). Such studies have an advantage over the indirect methods of studying expectations in the sense that in the latter case, the conclusions concerning the expectations formation process depend very much on the choice of underlying behavioural model. However the utility of such direct studies critically depends upon the accuracy with which expectations have been measured. Also the aggregative nature of the expectations series can also cause serious problems. This is especially important in testing for rational expectations hypothesis, where some fictitious representative agent is assumed. To what extent the survey expectations typify such a representative agent is a moot point. Harekar (1991) has investigated the conditions that are required to be imposed on the choice behaviour of differing individual agents so that the expectations of the representative agent may be identified. These conditions seem to be too stringent to be likely to be observed in practice. Survey studies of expectations therefore need to be treated with considerable caution.

Because of their empirical tractability, the assumption of adaptive expectations also has played a major role in the empirical work on expectations. Though obviously unsatisfactory at the theoretical level because of its arbitrariness, the assumption of adaptive expectations may be postulated as a convenient rule of the thumb. Muth (1960) has laid down the special circumstances under which the adaptive expectations hypothesis is optimal in the sense of yielding minimum mean square error forecasts. However in general the model fails to generate optimal forecasts. This is so because its extrapolative nature leads individuals to consistently neglect other kinds of information that could have been available to them at the time of expectations formation.

RATIONAL EXPECTATIONS

These criticisms were taken care of by the rational expectations hypothesis (REH) starting with Muth's (1961) work. The model is based on the entirely plausible assumption that agents do not make systematic mistakes. The crucial question then is about how the individuals learn the underlying model which generates the correct forecasts. However if it is assumed that the agents somehow come to learn the underlying model, the optimality properties of the REH can be verified. The rational expectations hypothesis can be taken

to imply that the subjective conditional distribution of some random variable, say $X(t)$ coincides exactly with its objective conditional distribution. Let $I(t-1)$ be the information set that is available to an agent at time $t-1$. This set contains all the information available on all the relevant variables that enter into the relevant economic model and any other information, including that on past expectations that might be available to the agent at the time $t-1$. Let the finite dimensional column vector $X(t)$ represent the random variables that the agent is interested in. Let $f[X(t)/I(t-1)]$ be their joint probability distribution. Then the REH uses two mutually exclusive assumptions. In dealing with macro-economic phenomena, the REH practice is generally to assume only the equality of the first order moments of the subjective and the objective joint probability distributions.

Thus, generally,

$$\hat{X}(t) = E[X(t)/I(t-1)] \\ = \int X(t) * f[X(t)/I(t-1)] dX(t) \quad \dots (1)$$

where $\hat{X}(t)$ stands for the subjective expectation of the mean of $X(t)$. Though similar expressions can be written down for the higher order moments of $X(t)$, normal practice in macro-economic research is to postulate equation (1). On the other hand, in micro-economics, where more fundamental issues like learning have been studied, the higher order moments are also assumed to be equal. The optimality properties of these models depend critically on the following properties [Pesaran 1990]:

- (1) The expectations errors conditional upon the available information sets have zero means
- (2) The expectational errors are uncorrelated with the values of all the variables in the information set and hence with their own past values.

In other words, the forecast errors should be orthogonal and lack serial correlation. Given these properties, the unbiasedness and efficiency of rational expectations can be proved in a fairly straightforward fashion [Pesaran 1990].

Let $E(t)$ be the error in expectations. Under the REH it then becomes :

$$E(t) = X(t) - E[X(t)/I(t-1)]$$

$$E[E(t)/I(t-1)] = 0 \quad (\text{By the law of iterated expectations}).$$

The second property follows immediately: $E[E(t-1)E(t)/I(t-1)]$

$$= E(t-1)E[E(t)/I(t-1)] = 0 \quad (\text{since } E(t-1) \text{ is a known constant at time } t).$$

Thus, rational expectations forecasts are best unbiased. This property has been crucial to endearing them especially to the applied economists.

The rational analysis works on the assumption that a 'true' structure always exists for a given economy, this is in sharp contrast to the Keynesian view that

we elaborated earlier. The economy is itself is modelled as being away from the true structure though tending towards it at a given point of time. The procedure then is to specify the most general form of equations, including an error correction term, in order to capture the out of equilibrium dynamics as well as the tendency to the 'true' structure. The 'true' structure simply needs to be identified. It is generally assumed to be characterised by stable parameter values and a white noise error process. The ratiophiles thus fall into the positivist school, which seeks to validate models by their ability to provide accurate forecasts.

The models advocated here use the Arrow-Debreu 'contingent claims economic model' in an essential way. They are basically driven by optimising actions of the agents and hence implicitly rule out disequilibrium and learning. Such models, 'small analogue economies' are supposed to be useful ways of carrying out such experiments as would be very costly in the real world. As Lucas puts it, "The central idea is that individual responses can be documented relatively cheaply...". This is indeed the much-maligned method of 'casual empiricism' or the method of just keeping your eyes open. However, to formulate such models, not of isolated Robinson Crusoes but of entire economies, a theory of group behaviour is clearly needed. Here lies the rub, for under unrealistic assumptions, the representative agent makes its entry, unobtrusively, but which leads to much tragicomedy, as will become clear as we proceed with this paper.

A lot of progress has been achieved in formulating, specifying and solving rational expectations models. For excellent surveys, see Taylor (1985) for methods of solutions in small models and Blanchard (1985) for analytical as well as numerical methods in large models. A summary is also available in Blanchard and Fischer (1989). A detailed examination especially of solution methods is carried by Whiteman (1983).

It is clear that rational expectations require the agents to know the true model underlying the economy. This means that agents either already know or are able to learn the true model overtime. While it is clear that agents learn from mistakes, it is by no means clear why they should converge to the rational expectations equilibrium (REE). This problem has only recently been studied. Again these studies have normally though not necessarily been carried out for micro-economic rational expectations equilibria. An REE is not merely a supply-demand or a market clearing equilibrium; it is also a state of affairs where all learning has been completed. In studying the convergence to such equilibria two approaches have been followed. The first approach assumes that the agents know the correct specification of the equilibrium relationships between

the market prices and the private signals, but do not know some of the parameters. These models employ a feedback type of estimation where the feedback is from expectations to the outcomes. Models in this tradition are those, e.g. by Taylor (1975), Bray and Kreps (1984), Townsend (1983), and Brandenburger (1985). All these studies have reported a convergence to the rational expectations equilibrium, except in the case of Bray and Kreps where the convergence is not necessarily to a REE. However as Pesaran (1990) has pointed out all these models assume that the agents know about the true relationships in the economy, but do not explain how the agents learn about these relationships in the first place.

An alternative strategy that has been used is to model boundedly rational learning. Here, the agents are not required to know the true structural relationships in the model. However they are expected to follow a plausible learning rule to which they remain committed throughout the period during which learning is taking place. De Canio (1979), Radner (1982), Frydman (1982), Bray (1983), Bray and Savin (1986) all utilise the above framework. Here convergence to the rational expectations equilibrium is possible but cycles and divergences cannot be ruled out. This approach is also problematic because the agent is not allowed to revise the learning rule in the process of learning. This would already assume some a priori knowledge of the working of the economy. The models do not explain the source of such extra modular knowledge on the part of the agents.

SOME FURTHER PROBLEMS

The nadir of ratiophiles approach was reached when the representative agent became fashionable and adorned with new – classical assumptions. As an aside, I may mention that this is one more instance where the relentless and single-minded application of a perfectly plausible first principle leads to nonsensical propositions. Earlier, the neo-classicals had taken the marginal principle of Ricardo and transformed it into a universal principle of cosmic order, with the consequent enervating effect on research in economics. Human ingenuity, it would appear, seeks to logically refine every idea to the extreme, leading to, what I term as the 'refinement trap', whilst wisdom lies in holding back, if one is to end with anything but the 'atoms and the void'. Let me first turn to the policy neutrality proposition.

Rational expectations by themselves are not sufficient to generate the policy neutrality propositions that have recently taken the macro-economic profession by storm. Tobin (1980) amongst others has investigated this matter. The REH has to

be combined with the assumption of continuous market clearing to justify policy neutrality. This input has been supplied by the search for microfoundations of macro-economics. Since it is difficult to justify nominal rigidities on purely theoretical grounds, markets are taken to clear instantaneously. In the standard literature concerned with the issue of microfoundations, a necessary albeit an implicit assumption has been that of the homogeneity of expectations. Without this assumption, the use of the representative agent paradigm becomes methodologically untenable. Harekar (1991) shows that the classical theory of choice does not put enough restrictions on decision-making to achieve this. The additional assumptions required are not likely to be satisfied in practice.

Let me say a few words about the 'representative agent'. Now, any given macro-economy consists of several diverse individual agents, co-ordinating their economic actions. Indeed, macro-economic outcomes are results of such co-ordination and interaction. Rather than model the entire collection of channels through which agents interact with each other, the analogue economy school makes the short-cut assumption of a representative agent. Some hypothetical representative agent is assumed, whose actions are deemed to be synonymous with macro-economy's responses. Thus, macro-economic activity, rather than being seen as a result of inter-play of agents' action is seen as an aggregative micro-economics. No serious effort has been made by economists of this school to verify that such a short-cut is possible. Indeed, Mathur (1993) persuasively argues that the basic assumptions here are very highly tenuous. One way of rationalising the representative agent is to look at the individual as mimicking the aggregate, with the implication that the aggregate made up of several maximising agents, itself behaves like the maximising agent. There is no formal justification for this. Individual maximisation does not – as we well know – does not necessarily engender collective rationality. A very simple illustration of this is the prisoner's dilemma.

Thus, unless one wants to risk taking the position of 'individual foundationalism', such models ought not to be used for policy analysis, for, the identity of the representative agent is itself not invariant to policy changes. Of course there is the further shortcoming that, all considerations of distribution, as also the response heterogeneity and diversity are ruled out by definition. Surely these are matters that warrant consideration.

It is in this context that the concept of culture comes into its own. Economic theory however makes relatively little use of this concept. The term culture is used to refer to that part of behaviour which is acquired

by unconsciously imitating the conscious or the unconscious examples of the surrounding society [Max Steur 1990]. In such a set up the state of the world is inferred by looking at the other agents of the society. Here optimisation and imitation can coexist. The stable coexistence of fundamentally different modes of learning is a very real possibility that the mainstream learning models have ignored. Even with a uniformly naive population, i.e. one that uses association or a slightly more advanced analogical form of reasoning, there might be islands of perverse selection. Further this may be a stable phenomenon rather than just a fleeting suboptimality. All this must put some doubt into the minds of those who seek to aggregate micro-phenomenon on the often implicit assumption of homogeneity and the consequent application of some form of the certainty equivalence principle. Indeed, there emerges a serious doubt about the logical validity of some of the macro-categories when viewed as aggregates of the corresponding micro-categories in the *ex ante* sense. Hicks (1939) made much the same point, "Nothing has been said about income, about saving... My decision to abstain from using these categories was deliberate. In spite of their familiarity, I do not believe that they are suitable tools of analysis which aims at logical precision... At the bottom they are not logical categories at all. But if we try to work with terms of this sort in the investigation we are here concerned with, we are putting on them a weight of refinement that they cannot bear." The upshot of this must be that trying to work up to macro-economics from micro-economics in the traditional way is a false start. Macro-phenomena are not derivable by simple aggregation from the micro-phenomena. They of course depend on the micro-level reality but they also have a statistical existence of their own. They represent a specific reality in their own right. Macro models derived without taking into consideration these factors and used to obtain policy propositions give rise to the mythical propositions of present day macro-economics of tenuous validity especially since they implicitly assume the existence of the representative agent. Let me drive home the point by elaborating further. There is implicit in the raxian analysis an assumption of foundationalism. Foundationalism also allows the economist to rule out irreconcilable inter-agent differences amongst economic agents. Indeed, differences in conception are seen as perceptual differences arising out of incomplete or asymmetric information. These are then treated as frictional rigidities and thus of peripheral interest, for the theoretician. The rational agent is deemed to somehow be capable of 'learning' and thus smoothing out these difficulties.

All this means that modern macro-economics never really differentiates itself from micro-economics. As a relevant aside, I may mention that a critique of the position of foundationalism and the related ontological individualist, from a hermeneutical point of view has been advanced. Of course, this has been the handiwork, mainly of sociologists and cultural anthropologists [Jarvie 1972]. In recent times following questions, e.g. have been debated.

- (1) Does there exist an aggregate reality which is different from the sum of its parts?
- (2) If such a reality exists, how is it different from the individuals constituting it?
- (3) What is the relationship of such a reality to its constituent parts?
- (4) How does one understand such a reality?

This context, naturally leads me to the micro-macro debate, with special reference to culture. One of the pioneers held the view that aggregate (macro) reality had an independent existence in its own right [Comte 1864]. Of course, this is extreme. The position of the ontological individualist cannot be completely negated. Rather the difference between these two realities may be understood as follows. When one is asking a question about the individual behaviour, the answer comes in terms of intentions. However one cannot get a similar answer when it comes to a question posed about an institution. Here the answer has an implicational connotation [for discussion in this and related areas, see Hatekar 1993]. A simple example is that of the institution of money, which is not of anyone's conscious creation. A focus on implications produces a view of the social whole as a logical system. A theory of group behaviour will have to take this into account. The meaning of a *whole* is in terms of its *parts* and its organisation (emphasis added) the meaning of a *part* is in its logical articulation with other parts to form a whole [Hanson 1975]. An attempt to understand the whole, exclusively in terms of its intentionally acting individuals will lead the scientist astray. The distinction between the intentional and the implicational meaning parallels the micro-macro behaviour. This may be elaborated by any number of examples for instance those of aggregate savings or investment [Hatekar 1993]. Let me make a longish detour here to deal with tangentially related topic, of the existence of money in an economic model.

A DETOUR ... ON MONEY

Now, one of the classic problems that was in vogue not so long ago was to prove the existence of money in an Arrow-Debreu model. After all Arrow-Debreu model is the most elegant model that theoretical economists have at their disposal and if it did not have a place for money in it,

surely it was a matter of grave concern. I shall later argue that the way in which arguments were made were fundamentally (methodologically) flawed, but as Voltaire would say, 'text before criticism'. Thus, let me begin by recapitulating some of the arguments.

In a scathing criticism of the practice of modelling monetary economy in the Arrow-Debreu paradigm, Hahn amongst others opined that the most well developed model in economics had no place for money in it. Taking the case of Patinkin's effort Hahn tried to argue that since it was compatible with an autarkic situation, it was basically not very useful in discussing matters pertaining to money. This was done by constructing a formal model in the spirit of Patinkin, in the Arrow-Debreu format, with n goods, the last being designated as 'money'. Under the usual conditions then, it was possible to show that there existed an equilibrium, i.e. $P > 0$, such that $Z(P) < 0$. Starting from this point it was then demonstrated that it was possible to induce an equilibrium, holding the n th component of the price vector equal to zero. Thus with exchange value of money being non-positive there was no rationale for its existence. The argument then extended on two counts. One, that this happened because 'money' was given no special role to play in this model, and second, that the underlying model was essentially static. The latter point needs some labouring upon.

The main reason underlying this argument needs a recap of the Arrow-Debreu construct. In its original and most basic formulation, it deals with complete markets and essentially static scenario. This bears a word of explanation. There are futures markets admissible so that in the strict sense it is not a one period economy. However, once it is assumed that markets are complete, in the sense that all future contingent and insurance markets exist, all the contracts regarding present and future deals are effectively signed in the first period itself. The only uncertainty allowed is state dependent and that can be taken care of by insurance markets. Of course, one objection that could be raised immediately is that this requires the existence of too large a number of markets. This objection was taken care of by an ingenious contrivance of the so-called Arrow securities. This was technically accomplished by looking at the underlying basic vectors or what in linear algebra is called the spanning set. This tremendously reduced the order of the number of markets required. However, all this still allowed for a collapsible market, in that, one could still operate with a single budget constraint. It is to Radner that credit goes for pointing out that what was missing from the point of view of a meaningful model was for

trading to necessarily take place at every date. This, he called an essentially sequential economy. He also incorporated some more complications by endowing the structure with asymmetric information. But Hahn later showed that his results and arguments were not crucially dependant on the asymmetry condition. Indeed, with the assumption of incentive compatibility, 'asymmetric information' loses most of its bite.

Now the real crux arose, for, an essentially sequential economy was truly dynamic in the sense of incorporating time. Once the time was incorporated in the model, there was no way that *expectations* could be kept out. Of course, this does not end here, for, with expectations, there is a possibility of mistakes and then the crucial question, it would seem, has to deal with *social (system) learning*. This is also where the difference between micro and macro comes into focus. After all, human beings especially in incomplete information environment, act in a culturally constrained, norm-based fashion. This is a difficult problem. The mainstream economists, especially the rationalists chickened out and took the easy way. They treated this question of learning by ignoring it and studying the system behaviour in equilibrium, when anyway all learning is presumed to be complete.

Now, this question of culture constrained, norm-based learning is a pretty complicated issue and cuts freely into the domains of other social sciences. Here we make an attempt to suggest a way of looking at the rather limited yet vastly difficult area of 'perpetuation' of certain norms, without getting entrapped in the epistemic tangle of the 'origin' of norms. This latter enquiry I believe is intractable and wrong headed, from a social point of view, for, it will force us into a static-ontological methodology while examining the question of existence of money.

To make my position clearer, I need to draw on some of the concepts in game theory, in particular the concept of evolutionary stable strategy. Pioneering work in this area is due to John Maynard Smith by way of an application in the domain of biology. Kaushik Basu has recently suggested – in applying these concepts to human societies – some modifications leading to an intuitively brilliant framework. In the classic Hawk-Dove game, there are two types of phenotypes and one can then ask questions regarding the viability *vis-a-vis* the survival of each type of agent under different assumptions about the division of population. In the societal context, question may be asked about the success of invasion, leading to the concept of evolutionary stability. Understood in the context of social institutions, this implies that survival of certain type of institutions in a society is

not necessarily a pointer to their optimality, but one can plausibly argue that its existence cannot be completely detrimental to society. Also this framework is useful to analysing the 'culture' prevalent in the society. This is achieved by reducing the pay off matrix suitably, to rule out certain strategies that are not permitted in a society, given its norms. This leaves open the possibility, of certain suboptimal institutions, which have emerged as historical accidents, surviving in a stable sense. The immediate application of this to the case of 'money' is obvious. In mathematics, perhaps, the logical necessity is paramount, but in economics which concerns itself with life as it is live in real (historical) time, historical accidents can serve as initial causes. The perpetrating causes need not strictly fall in the category of 'logical necessity' but it may suffice if they are merely 'tolerably viable'. Thus, the search for existence of money in an economic model in the 'ontological' vein is wrong headed the more sensible procedure is to treat it in the existentialist mode. Before I return to the main theme, let me just mention that this frame of analysis has deep ramifications. For example, using it, it is possible to show how a population where a critical mass 'reads' Monetarist literature, may gravitate towards a 'monetarist' economy in a self-fulfilling sense, thus shedding light on the nature of social truth. This formalism also allows us to bring in 'culture' into analysis. This could be done in two ways. First, the original game pay-off matrix may be reduced in a normed determined fashion. Second, in a repeated game context, the rate of convergence (learning) may be different for different societies leading to different stable solutions, having started from the 'same' initial conditions. I have perhaps drifted too far afield and so let me quickly bring this detour to an end and return to the main concerns.

MICRO-MACRO BRIDGE

There is ample evidence in what has been thus far said to surmise that the bridge from micro to macro-economics is not simple. The causality perhaps more importantly runs the other way round. I stress this here, since it is far less recognised. Macro-economic research propositions whether they are true or not have the power to create sunspots which feed into the agents' micro-behaviour within an expectational frame. Indeed, these provide inputs to give a substantive meaning to micro-level rationality. How then do the agents learn or derive expectational content from received macro propositions? Our conjecture is that not unlike the learning by children, the social learning of technical economic propositions never goes beyond

the first stages of Piaget's scheme. It is thus mainly through associations and simple analogies. Individual learning in the social context is culture constrained, taking place through fables with simple morals. Though there is a tacit recognition of the complex nature of things, at the operational level, anecdotes and fables are what survive as simple learned truths. These are historically reinforced by associations thrown up by casual empiricism. Cultural constraints and belief formation then become central to this whole process of expectations formation which into the micro behaviour and indeed provide the parametric environment for rationality. Beliefs here are a part and parcel of the variables that need explaining. They would thus need to be endogenised. There is an increasing realisation among the economists that ignoring beliefs and simply modelling facts could be illegitimate. [see, e.g. Samuelson 1958, Tirole 1985, Grandmont 1986, Woodford 1988 and for a slightly different treatment Canning 1990]. Macroeconomists have suddenly woken up to the possibilities of self-fulfilling beliefs and sunspots which seem to indicate to the importance of endogenising beliefs. An interesting work in this area is by Kirman (1983) where he shows that once the beliefs are endogenised, consistent belief structure may lead agents to be trapped into what he terms as 'misinformed equilibria'. Extrinsic uncertainty, self-fulfilling prophecies, animal spirits and related phenomena have been thought for some time to have a role in macro-economics. Recent work [Shell and Wright 1991, and Chiappori and Guesnerie 1991] shows the various ways in which these effects may materialise. One interesting and pertinent interpretation they provide is that sunspots can act as signalling device, to co-ordinate individual actions, as well as a randomisation device to convexify opportunity sets. The major problem here is to do with the uniqueness of solution which to hold requires a position which is in consonance with the classical philosophical position that truth waits out there to be uncovered rather than the prevalent view of truth as a property of propositions. Facts, in economics being what they are, (i.e. dependent on both our conceptual frame as well as the initial conditions) it is perhaps best not to strive for uniqueness in the ontological vein for this may very well lead us to the self-referential problem of 'who programmes the programmer' type.

Thus, I hold that macro-economic research and the associations and analogies it throws up lead to expectational equilibria through bubbles and sunspots. Obviously there is nothing in the nature of things that stops the set of such REE from having the cardinality of the continuum. Of course, pure sunspot

models are difficult to rationalise in a relevant way. Lucas circumscribed between the real and the sunspot equilibria, thereby reducing the total number of possible rational expectations equilibria. There exists a broad spectrum of possibilities from the 'pure sunspots' to the 'completely real' economies. The contribution of many rational expectations theorist has been inclined towards the more real end of the spectrum. This is a superstructure, as it were, built upon the foundations of Arrow-Debreu formalism. Consequently, the problem of multiple equilibria has to be faced. Each of this equilibrium has a particular historico-institutional structure implicitly built into it. The whole space of economies may be partitioned into subsets each of which is an island of possibilities and not necessarily a singleton. Which island one reaches and which specific possibility is in fact realised is a matter of historical circumstances. A certain degree of policy-path connectedness is presumed to hold with respect to almost all the islands (else we must face a no exit situation). In general, there exist several equilibria on each of these islands. A selector function must now be employed to specify an ordering over these equilibria. The selector function must also provide an ordering over the set of supremal (most preferred) equilibria across the islands.

It is interesting to speculate about the interpretation of the famous 'Natural Rate Hypothesis' (NRH), in this scheme of things. Friedman has defined the natural rate as that rate of unemployment that is grounded out by the Walrasian system of equations. This is very much like the Smithian stationary state where the 'full complement of riches have been reached'. The difference lies in the fact that while the Smithian stationary state was brought about by the forces operative on the demand side, the forces that bring about the natural rate operate on the supply side. The parallel is drawn simply because both of them share the ideology of the non-interventionist state. Thus take agents to be ratexians (having identical expectations), suck time out of the model, use the Lucas critique, and hey presto, you have policy ineffectiveness. The policy ineffectiveness proposition points to the impossibility of exploiting the trade off between inflation and unemployment that never was. For the very assumptions of the model rule out any trade off of this kind so that the structure of the model leaves nothing to exploit. Indeed the long-run policy ineffectiveness proposition comes very close to being an exercise in vacuous logic. Yet there is something to be said for the policy ineffectiveness proposition. On a given island (conditioned by the historico-institutional and informational structure), it allows us to identify those equilibria where

the application of policy in the narrowest sense might yield superior results, by way of transition to those equilibria where NRH holds. If one reaches one of the best natural rate equilibrium on one island then the NRH points to the fact that a set of different type of policies need to be brought into play, to make a transition to possibly an even better NR-equilibrium on another island. The Natural Rate Hypothesis (NRH), I believe, thus helps us for taxonomic purposes in the classification of the policy type.

Though the importance of expectations cannot be denied on the theoretical plane, one needs to be careful whilst incorporating them in a macro-model. Micro theory tries to understand and explain agent behaviour. This entails an element of volition on the part of the agent and a perception of the environment leading to mental constructs like the familiar schedules and hence a presumed role for expectations about familiar variables. Macro-phenomena appear in quite a distinct way. They are the realisations, concrete results of the agent actions, given the actually existing environment. The fallacy of composition has to be guarded against. Also, they are methodologically unacceptable if they involve the assumption of homogeneity of expectations and thence an application of the certainty equivalence principle. A trade off as always has to be worked out, between the cost of modelling expectations and the consequent benefit in terms of statistics and/or added economic insight into the working of the process at hand.

IN CONCLUSION

Having been critical of much that is being done in the main-stream of economic profession, it is perhaps time to take stock. My own views about macro-economics, which come fairly close to the 'coherence' school [again see Hatakhar 1993] opens doors for 'subjectivism' in all its splendour. As Rorty (1979) puts it, "... theories seem to license everyone to construct his own little whole, - his own little paradigm, his own little practice, his own little language game and the crawl into it". Let me make haste to clarify that my point here is mainly to inject a small dose of modesty into the practitioners of our profession.

That dynamics is crucial to economic theorising is at least as non-controversial as things can be in economics. It is then a straightforward corollary that time and uncertainty cannot be left out. Trying to get these two elements into economic theory has truly been a pons asinorum of mainstream economics. Let me recall that the most elegant model we have, viz. that of Arrow-Debreu for the competitive economy is essentially static. For all the

'uncertainty' and 'time' incorporated, it continues to be a model with collapsible future. Indeed it has no place for money, which leaves the entire area of monetary economics without foundations. Of course several refinements are possible. One such is the introduction of the called Arrow securities, which are the basic securities which span the entire contingent market space, and considerably weaken the requirement of the existence of complete contingent markets. The other route is to postulate an essentially sequential structure to the economy with trading at every date. This along with asymmetric information is the path followed by Radner, whilst Hahn puts more emphasis on transactions costs. Either way one reaches missing or incomplete or inactive markets, and creates scope for analysing a monetary economy. One may now incorporate expectational structures to tackle dynamics analytically, as Grandmont amongst others has done. But this way of modelling is fatally flawed, since, all the expectations are based on well behaved probability distributions. Also, there is no scope for disequilibrium behaviour to show up, and hence learning to take place, so that one never does leave the world of steady state with its notional time. Thus the Arrow-Debreu model and its generalised variants continue to be deficient in that they are steady state quasi-dynamical systems, mostly without heterogeneity. This is about as much as the analytical methods will permit. It is here that computational economics can be of help [Kendrick 1981, 1988, Amman and Kendrick 1990]. Computational techniques, must be turned to for a greater understanding about relevant models of economies, e.g. with all types of uncertainties embodied.

Finally, to sum up, in order to be in a position to incorporate dynamics into our analysis and to make progress with our understanding of economies, three things must importantly happen. First, induction of real time into our models, so that we may model disequilibrium process dynamics, and realistically endogenise learning. Second, allowing for interactive dynamics in the intra-temporal sense, or quite simply making room for heterogeneity among agents, by incorporating 'culture' so that one may avoid the fallacious propositions derived from misguided aggregation leading to representative agent models. Now, given the tools at our disposal, only to a limited extent can the above be accomplished analytically. This directly leads me to my third requirement, viz. a symbiotic relationship between 'theory' and 'empirics'. It is a safe conjecture that the next real advance in our understanding of economics will come from the specific area of computational economics. It has been a real tragedy for

economics, that its practitioners have resolved themselves into two distinct compartments, viz, those who indulge in high theory and others who dirty their hands with empirico computational work. Whilst the latter group has at least sometimes tried to incorporate the advances made in theory, the high priests of theory have almost always shown scant regard for their 'empirical' colleagues. The earlier we break down the partition which exists between these two cultures in our profession the better it would be for all concerned.

Nature of Capitalist Transformation

Continuing Relevance of Marxism

James Petras

Chronis Polychroniou

Since the collapse of Soviet-style planned economies in central and eastern Europe and the disintegration of the former USSR, Marxism has been dismissed by intellectuals of all political stripes as a potentially relevant force. This is profoundly mistaken, for the collapse of bureaucratic collectivism vindicates Marxism in theory and political practice. This paper highlights the relevance of Marxism in understanding the fall of state socialism and the deep structural dynamics and contradictions of contemporary capitalism

SINCE the collapse of Soviet-style planned economies in central and eastern Europe and the disintegration of the former USSR, reactionaries, conservatives, liberals, neoliberals, (ex)socialists, some feminists and post-Marxists are desperately trying to outdo one another in devising the ultimate requiem for Marxism.

The dismissal of Marxism as either an intellectual tool or as a potentially politically relevant force in the contemporary world is profoundly mistaken. The collapse of bureaucratic collectivism signifies the definitive vindication of Marxism in theory and political practice. What took place in the former state socialist countries in the late 1980s and early 1990s was the end result of a massive legitimacy crisis caused by the political and economic alienation of the working class from the work place and the polity. Moreover, the chronic crisis of capitalism over the last 20 or so years (stagnation, massive unemployment, global economic polarisation, declining living standards) has now reached historically unprecedented levels, thus validating the Marxist critique of capitalism. What is happening to most capitalist economies and countries throughout the world is comparable to the processes that took place in the mid-19th century - large-scale growth of capital accompanied by a geometric rise in unemployment, poverty, crime, and suffering.¹ Today, the official number of the unemployed in the OECD countries stands at over 35 million and is growing, with some 15 million having given up searching for a job.² Indicative of the nature as well as the severity of the crisis, the rate of unemployment in the youth labour force among several of the OECD countries is 30 per cent.³ By the end of the 1980s, 15 of the so-called 'developing' countries had steadily declined in income growth, with some of the 'economic miracle' cases - Nigeria, Argentina, and Venezuela - having their GDP drop by double digits.⁴ World inequality has also reached new dimensions. In 1989 the ratio differential in per capita income between the richest 20 per cent of countries and the poorest 20 per cent stood at 65 to 1, and at 140 to 1 between the richest

20 per cent of people and the poorest 20 per cent.⁵ Capitalist 'development' has ensured that one billion of the world's people live in absolute poverty.⁶ More than 15 million children die each year from poverty.⁷ At the same time, and equally as important, the structural contradictions of late capitalism not only continue to go unchecked, regardless of whether capitalist governments intervene systemically in the economy (liberal/social democratic) or not (neoliberal) but the principle of profit maximisation now threatens the world with an ecological disaster. The tropical forests, already eliminated by more than 40 per cent, are disappearing "at a rate of 30,000 to 37,000 sq miles every year"⁸ as multinational timber companies are having a field day under free trade, free market legislation - the recipe for the uninhibited accumulation of wealth by the corporate and finance masters at the expense of the rest of society and, of course, of the environmental/ecological system. The anarchic profit-drive system of capitalism, with its air pollution, haphazard disposal of industrial waste, ozone-damaging technologies, and land and water contamination, is rapidly converting the planet into a "hellish place". The way, therefore, to deal with the problem of environmental degradation is to drastically alter the structures of the economy, do away altogether with the system of capitalism. No other response can be counted on to satisfy the environmental requirements. To be sure, "those who focus on people as the problem, rather than on [the] economic and military practices" of capitalism, as Victor Wallis writes, "need to be reminded that the US leviathan alone emits more carbon dioxide than Asia, Africa, and Latin America combined".⁹

Welcome to the make-believe world of the new capitalist order. While the media and the intellectual ideologues of capitalism are trying to convince the world of what an antiquated system is Marxism, the "natural laws of capitalism" are working in the meantime to frightful perfection, spreading misery and destruction along their path. Indeed, the objective conditions for socialism have never been more ripe

than they are at the present historical juncture. Socialism or barbarism is in many respects a far more relevant call today than it was in the 1950s. Yet, the problems facing Marxists today and in the proximate future are very daunting. To reinvigorate belief in the validity of Marxist thought and the socialist vision is by far the biggest and most immediate task that Marxists have to confront.

We will begin with a discussion of the so-called 'crisis of Marxism', arguing that it is a crisis of the intellectuals - a 'failure of the nerve'. In the face of powerful pressures emanating from the capitalist centres, the 'crisis of Marxism' is seen as a subjective reality rooted in the misperceptions and sense of powerlessness of the ex-Marxist intelligentsia. By arguing and analysing the 'subjectivity' of the crisis, we will be clearing the way toward opening up a discussion of the objective relevance of Marxism in analysing both the demise of bureaucratic collectivism and the structural dynamics and contradictions of contemporary capitalism. We will then proceed by highlighting the relevance of Marxism in understanding the fall of state socialism. In this regard it is important to remember that while bourgeois writers first described 'communism' as on the brink of imminent collapse and subsequently as a 'totalitarian monolith' incapable of internal evolution and reform, Marxist critics focused on the contradictory nature of state socialism (tensions between its worker origins and bureaucratic rulership, tensions between its socialised production and bureaucratic control and appropriation of surplus) and its ideological claims (collective good versus privileged elites). We will then turn to discussing the relevance of Marxism in understanding the deep structural dynamics and contradictions of contemporary capitalism - in a fashion that highlights the way in which the Marxist analytical framework is superior to any of the competing liberal, neoclassical or postmodernist approaches. This in turn will allow us to raise the real challenges and problems that face Marxism in its struggle to become politically relevant in the contemporary world.

In one not unsubstantial sense, the 'crisis of Marxism' as it is discussed today is a 'crisis of the intellectual nerves' - it is the capitulation of the former leftists before the seemingly overpowering presence and politico-military triumphs of capitalism in the contemporary world.¹⁰ The ex-leftists are traumatised by their negative vision. The world market is everywhere, the rules of the international banks are imposed consistently, the industrial working class is in retreat or declining, the United Nations has become a US-European global police force. Faced with this apocalyptic vision, the ex-leftists decide it is best to operate from the market, to manipulate the rules of the banks on the margins, to narrow their focus to local activities ('civil society'), to make a virtue of necessity by joining the chorus condemning state intervention and the struggle for state power, to embrace narrow cultural identities as the focus of militant activity in the interstices left by the dominant capitalist powers; in a world, turn to 'possibilism' - the hope that by painting mascara on Moloch, greed can be harnessed into a capitalist humanist social pact.

The 'failure of the nerve' is rooted in the failure of the left to resist the ideological pressures from the western mass media and states (as well as their intellectuals in uniform) to amalgamate Marxism with the bureaucratic collectivist regimes and to reproduce history from an anti-socialist, anti-working class perspective. There is the perception by many, particularly on the left, that the collapse of the bureaucratic collectivist regimes reflects the 'failure' of Marxism. Insofar as this view has permeated social and political movements worldwide, it has severely weakened all of the left, including those who understand otherwise. Insofar as this perception has led to defections toward liberal politics and sectoral reformist movements, it has narrowed the arena of public debate, closed access to media outlets and fostered demoralisation and disorientation in the popular movements.

Second, insofar as substantial parts of the left - including non-communist sectors - were materially dependent on the bureaucratic collectivist regimes for support, the demise of the latter has undermined the willingness and ability of the left to function outside the parameters of world capitalism. Third, the political class in the west and the ex-communist bureaucrats in the east have monopolised the mass media and public debate on the meaning of the collapse of state socialism, amalgamating bureaucratic collectivist ideology with Marxism. Insofar as they have been successful in convincing the populace and intellectuals of their equation (collapse of bureaucratic collectivism = end of Marxism), the tasks

of clarifying and distinguishing Marxism from bureaucratic collectivism has become infinitely more difficult.

For the above reasons, contrary to what many anti-Stalinist Marxists believed, the demise of bureaucratic collectivism has not cleared the way for a reasoned consideration of Marxist theory and practice, nor has it facilitated the growth of autonomous, authentic Marxist movements. As a consequence, Marxism around the world is viewed now by many academicians and political activists as an ideology whose time has passed.

BOURGEOIS VS MARXIST CRITIQUES OF BUREAUCRATIC COLLECTIVISM

Bourgeois writers were never able to provide coherent, sound analyses and explanations of the rise and evolution of state socialism or of the outbreak of socialist revolutions. Describing socialist revolutions as the novelty of armed, minority revolutionary groups is a blatant distortion of the objective historical conditions that led the dispossessed to revolutionary change oriented toward achieving greater equality, social justice, and freedom. Furthermore, the characterisation of state socialist regimes as 'totalitarian' and incapable of internal reform is sufficient to make clear the inapplicability of bourgeois, liberal discourse in understanding and explaining the historical and structural reality of the development of bureaucratic collectivism. The same is true of its demise. The celebration of the collapse of state socialism by bourgeois writers is a pathetic display of little catechism - formulations construed in terms of ideological subjectivity shaped and determined by an essentialist, anti-socialist discourse that aims to dismiss Marxism altogether.

For some writers the demise of bureaucratic collectivism signified the worldwide ascendancy of liberal democracy, the supremacy of capitalism - the 'end of history'. According to this view, socialist revolutions were a detour in the march of history toward liberal democratic capitalism. For others, the socialist revolutions were the hidden hand behind bourgeois revolutions, clearing pre-capitalist debris from society and preparing the way for a new and more vital stage of capitalist development.

The "end of history" argument, embodying a pseudo-Hegelian, teleological view of history, fails to see liberal-capitalism as a historically specific social system with its own morphology, its rise, maturation, decline, and transformation. Periodic breakdowns of capitalist societies, their violent intrusions into weaker states, their perennial expansion and subordination of vulnerable economies, their diversion of resources and impoverishment of domestic

societies in the name of global leadership have been accompanied by wasteful and destructive wars that have, in turn, been turned at times into anti-capitalist revolutions some of which have been subsequently reversed. In sum, there is no historical basis - past or present - for arguing for 'linear progress' toward 'free markets' and 'liberal democracy'. Capitalism - whether liberal democratic or authoritarian, state-centred or market-oriented - has evolved in response to the tension between internal and external opposing forces: the internal conflict between capital and labour and the external conflicts among competing capitals. Periodic revolutions and counter-revolutions reflect the internal conflicts, while the world and regional military and trade wars reflect the external conflicts.

Additionally, the decline of state socialism in the east has not been brought about by a capitalist social class, nor has there emerged in its place a liberal-democratic capitalist society and economy. The overthrow of state socialism (assisted simultaneously by the imperialist onslaught of the west) was largely the product of a bureaucratic elite imbued with a capitalist ideology, but with no historical ties to capitalist production and its markets. The nearest approximation of an indigenous capitalist class was the illicit contraband networks working the interstices of the state planning system. The consequence of the capitalist restoration by a non-capitalist class has been the grafting of policies and practices on a society without the social agencies to implement them. Instead of a domestic capitalist class, what has emerged is a group of intermediaries for western capitalism: on the one hand, the growth of a powerful strata of plunderers ('mafia networks') who pillage the existing economy of public resources and divert overseas loans to foreign bank accounts without developing the productive forces on the other.¹¹ The resulting decay of post-communist societies is found in large-scale long-term unemployment, crime, prostitution, and decline in production and consumption. This development has been matched by the growth of authoritarian rulers and the foreign dictation of economic policy. Neither liberal democracy nor capitalist development has emerged from the collapse of bureaucratic collectivism. The break-up of the former USSR and the assumption of power by pro-western rulers has not even resulted in the establishment of viable nation states. Ethnic divisions and civil wars, and nationalist and religious authoritarianism have been the most prominent features of the post-communist world.

Finally, contrary to the "end of history" scenario, many post-communist societies have regressed in social and cultural terms. 19th century diseases have returned, ban on abortion are now in place, widespread

pauperism among retirees has become the norm, highly trained scientists are unemployed or working for a pittance. What is purported to be the definitive triumph of liberal-democracy and capitalism over communism is in fact the disintegration of the nation-state into ever shrinking warring ethnic enclaves, the decay of public life, and the destruction of production systems. The triumph of the free markets is a story of dispossession, impoverishment, and national humiliation. Thus, rather than view the collapse of state socialism as a bourgeois evolution clearing the way for capitalist advance, it is more empirically correct to view the ascendancy of the free marketeers as a historical regression – perhaps as a temporary detour toward a revitalised and new form of democratic collectivism.

In contrast now to the banalities of bourgeois political analysis, the evolution, crises and demise of bureaucratic collectivism was most brilliantly analysed and anticipated by Marxist thinkers using Marxist categories. We should remember that it was Rosa Luxemburg who identified the authoritarian tendencies implicit in the structure of the Bolshevik party.¹² Luxemburg never turned her back on the Bolshevik revolution (in fact she provided a sympathetic, although critical, assessment of the course of the revolution in Russia), but she saw with a clear eye that 'centralism', when misguided, may turn out to become an obstacle to revolutionary action, as it indeed was in the German Social Democratic Party, or a conservative force, as it indeed became during Stalin's reign. It was Luxemburg who pointed out the inextricable connection between democracy and socialism. It was Leon Trotsky who identified the new state apparatus as a distinct socio-political stratum appropriating the surplus from the working class, undermining egalitarian norms, contradicting the revolutionary origins of the regime.¹³ It was Trotsky who laid out the issues of international revolution versus 'socialism in one country' and workers' democracy versus bureaucratic dictatorship.¹⁴ It was the Marxist historian Isaac Deutscher who discussed the possibility of an evolution toward capitalist restoration.¹⁵ It was the Marxist philosopher Herbert Marcuse who challenged the Soviet claims of remaining faithful to the Marxist ideological tradition.¹⁶

The Marxist dialectical method, the use of class analysis, the application of notions of class contradictions, class conflicts, and the notion of the class nature of the state were essential to understanding the crises of the Stalinist system and the restoration of capitalism. Just as bureaucratic collectivism could not explain its own degeneration, post-communist liberal capitalism cannot explain the catastrophic crises that its institutions and politics are engendering. One should not

confuse the conjunctual pervasiveness or even the hegemony of an ideology with its profundity or durability.

RELEVANCE OF MARXISM

Today Marxism is the most useful perspective in understanding the major structural changes taking place in the capitalist world economy. Nonetheless, Marxist theorists must come to terms with the vast changes in class structures, technologies, state/civil society relations that have taken place over the last quarter of the century, otherwise their conceptual framework will become irrelevant in analysing the contemporary world and in fashioning a cogent alternative.

Major contemporary structural processes are best understood within a Marxist framework. A review of the processes in relation to basic concepts will illustrate the tremendous utility of Marxist theory.

(1) *Concentration and centralisation of capital within countries and across regions*: The mergers and buyouts accompanying the growth of global enterprises are one indication of this 'law of capitalism' noted in Marxist analysis. During the 1980s, which represented the latest huge wave of mergers and acquisitions in the historical development of industrial and finance capitalism since the 1880s, all giant corporations engaged in mergers and buyouts, in 1988 alone there were more than 4,000 mergers representing a total value of \$ 245 billion.¹⁷ RJR Nabisco's takeover by Kohlberg Kravis Roberts and Company in 1988, worth \$ 24.53 billion, is the largest acquisition to date.¹⁸ In the 1990s the billion dollar acquisitions are concentrated in the drug industry.¹⁹

(2) *Intensification and extension of exploitation accompanying capitalist expansion and competition*: The decline of income, longer working hours, the elimination of health, pension, vacation, and other benefits accompanied by the extension of work time and the growth of labour productivity attest to the relevance of Marxist analysis. Indeed, wage-salary and all-round capitalist exploitation have increased under 'globalisation' to unprecedented levels throughout the world. In the 'belly of the beast', 80 per cent of the US labour force that falls into the category of 'production and nonsupervisory workers' earned at the end of 1989 weekly wages that were less by more than 10 per cent of weekly wages earned in 1973.²⁰ - the year of the beginning of the current global economic crisis. At the same time, studies indicate that the average worker in the US in 1987 worked 163 hours more per year than in 1969.²¹ Similar weakening economic and social conditions are confronting the working class people everywhere as national governments are

institutionalising a myriad of devices to assist capital's ruthless quest for higher rates of profit. In Costa Rica, long considered a 'special case' in the economic development of Central America, Noam Chomsky reports that after the neoliberal programmes of the IMF and the World Bank went into effect in 1985, 37 per cent of the workers received wages that were below the legal minimum, average family incomes fell by 10 per cent, and poverty increased by 18 per cent in 1991 alone.²² Seeking to repress popular indignation over the deteriorating living conditions, the Costa Rican government has in turn increased substantially the size of the police force.²³ Indeed, one of the developments in the neoliberal global order is that state repression rises geometrically with the decline of income, and state budget cuts in health, education, and pensions. A case in point. In Greece in 1991, a giant demonstration of over 1,00,000 students, teachers, and faculty in Athens protesting the conservative regime's efforts to reduce the budget for state education, was viciously attacked by the police as it went on a rampage, leaving several dead and hundreds injured.²⁴ The savagery of the repression of the student protest – unprecedented in western Europe in recent decades – was an integral part of the regime's goal to strengthen the state against civil society in its efforts to implement its anti-working class economic agenda. As elsewhere, the neoliberal policy of 'public pain for private gain' in Greece has levelled the living standards of working class people while business profits have skyrocketed.²⁵

Yet another interesting case of the intensification and extension of exploitation accompanying capitalist expansion and competition worth pondering is that of Japan – often cited as the greatest 'success' of postwar capitalism. The so-called 'miracle' of Japan is based on a fascist technique of super-exploitation enforced by a natural alliance between state and big capital on a docile labour force and without any 'trickle-down' effects. Japan's economic performance displays 'a wide gap between increasing productivity and stagnant real wages'.²⁶ While "Japanese manufacturing labour productivity more than doubled (its index increased by 117.3 per cent in 1975-84)... the index in real wages increased only by 5.9 per cent in the same ten year period".²⁷ At the same time, Japan's industrial workers work on the average 11 to 13 per cent longer hours than workers in Britain and the US, and 31 per cent longer than their counterparts in Germany.²⁸ In the final analysis, when all is said and done about Japan's economy, "the miracle is explicable in terms of blood, sweat and raw muscle toiling for the nation's Big Capital".²⁹

Today, Marx's dictum about the relationship between capital growth and the deterioration of the working class' living

standards is truer than ever before: "The more...capital grows, the more the division of labour...expands. The more the division of labour...expands, the more competition among the workers expands and the more their wages contract".¹⁰

(3) *Growing class inequalities and social polarisation:* In Europe, the US, Latin America, and Asia 'free market' policies have broken the social safety nets and contributed to the growth of concentrated wealth and a growing sub-proletariat. Wealth has shifted dramatically in the last 20 years from the main of society to the upper echelons of the corporate and finance world. In the west, 'globalisation' is rapidly dividing societies into two sharply differentiated social classes in a similar fashion to the general trends in the third world and the post-communist societies. Simply put, the rich are getting richer and the poor are growing poorer. In 1992, the top fifth of US families received 51.3 per cent of the income while the bottom fifth got only 6.5 per cent of the income.¹¹ However, there is an even much greater inequality in wealth compared to income. Patterns of concentration of wealth in the US reveal that the richest 10 per cent are in possession of over 87 per cent of all wealth.¹² This phenomenon of inequality is worsening rapidly on a global level.¹³ In Chile, for instance, one of the so-called 'economic miracle' stories in the line item accounting of the IMF and the World Bank, in 1990 the richest 10 per cent of the population increased its share of the national income to 47 per cent from 36 per cent in 1970.¹⁴ Accordingly, "since 1973, consumption dropped 30 per cent for the poorest 20 per cent in Santiago and increased 15 per cent for the top 20 per cent."¹⁵

(4) *Growing inter-capitalist competition:* The trade wars and formation of rival blocs by the major capitalist rivals, and the re-emergence of inter-imperialist rivalries, completely undermine neo-classical notions of complementary harmonious market relations. The imperialist world is in complete disarray as the major imperial powers are blaming one another (with the US doing naturally most of the finger-pointing) for their own economic problems and the depression of the world economy in general. Under Clinton, the US has stepped up its criticism of Japan for running huge trade surpluses with the rest of the capitalist nations,¹⁶ including now charges for practising protectionism in order to safeguard its low unemployment rate.¹⁷ But increasingly, Japan is resisting more and more US pressures and what it rightly considers to be interference in the affairs of its own economy. A recent study reports that the conciliatory attitude of Japanese politicians toward Washington is being

gradually replaced with growing intransigence,¹⁸ no doubt largely due to the fact that Japan's own economy has now entered into a severe crisis as well. US-Japan tensions over trade are growing in intensity, indeed as are Europe's relations with Washington. The Europeans are also displaying growing frustration and irritation over US attitudes on trade¹⁹ as well as over US foreign policy matters, with the Balkans especially becoming a major area of disagreement.⁴⁰

With the decline of the US as the hegemonic power in the world imperialist system, and the global economy sinking deeper into depression, inter-imperial rivalries are intensifying and conflict is mounting in the new external relations of the major capitalist nations in the post-cold war era.

(5) *Tendencies of capitalism to crises and stagnation:* With the decline of war economies, the absence of major innovations capable of stimulating recovery and growth, the growing debts and fiscal deficits, and growing productivity and a narrowing consumer base, the inherent tendencies to crises have come to the fore. Since 1973, with the OPEC oil crisis during the winter of 1973-74 serving as the loudest announcement, the world capitalist economy has entered a structural crisis oscillating between recession and depression from which it has yet to emerge. In fact, the crisis has deepened in recent years and it is now severely affecting the entire developed capitalist world, with Japan being its latest victim. Japan's economy had managed to avoid the worst from the end of 1973 to 1975, thanks largely to its low rate of unemployment, as well as to absorb the second oil shock in May 1980 and to grow considerably before 1983-87.⁴¹ However, Japan's economy began to exhibit marked signs of decline towards the end of the 1980s as its economy overheated, and the crisis has become, as one free-marketeer put it, "of alarming magnitude and complexity".⁴² In 1992 Japanese department stores registered a decline in their annual sales for the first time since the 1960s, and in 1993 business failures were up 22.7 per cent from 1992.⁴³ In mid-1993 it was reported that "Japanese industrial output had fallen for twenty consecutive months" and that now "there were 81 jobs available for every 100 applicants."⁴⁴ In the fiscal half of 1994, Japan's 11 largest banks reported a drop in their combined net profit of 18.3 per cent, caused by an unprecedented number of bankruptcies among borrowers, and the stability of the country's banking system is now a major concern.⁴⁵ Lately Japanese businessmen and economists have started sending out warnings that by the beginning of the 21st century Japan could be facing

unemployment rates as high as 10 per cent, and that Japanese society therefore should begin preparing itself for such a future.

Major European countries such as France, Britain, and Germany are all faced with double digit unemployment rates, while Spain has over 20 per cent and many of the post-communist nations in eastern Europe as high as 30 per cent.⁴⁶ The tremendous pace of job destruction in the era of "globalisation" is connected to the internal logic of the capitalist system – overaccumulation and failure to utilise fully productive capacity – and the recent trends in late capitalism – deindustrialisation, the ascendancy of financial and speculative capital, capital flight, and a deproletarianised surplus labour force. The conditions of production of capital are radically different today than they were after the second world war. The long wave of technological innovation and the sustained economic development generated during the 'golden era' of post-war capitalism due largely to the war itself ran its course some 20 years ago. Since then, stagnation and a general economic and social crisis has set in, which the managers of capitalism have tried at various points to resolve through military pumping of the economy – a process that in the long run only deepened the crisis of capitalism and generated huge state fiscal deficits. Capital is now reproduced through investments in the 'paper economy' – stock markets, international currency markets, and all sorts of financial and otherwise non-productive transactions. Under today's capitalism, great predators do not make their fortunes by building factories or investing in the economy's infrastructure; instead, they bet on the economy of "casino capitalism".⁴⁷ Thus, George Soros, a financier and adviser to eastern European governments, became richer by a whopping \$ 2 billion in only a couple of weeks in 1993 by dropping \$ 10 billion on the German deutsche mark against the British pound and the Italian lira.⁴⁸ Indeed, the world's exchange markets have grown dramatically in daily turnover since the early 1970s. It is reported that in 1973 "\$ 3 billion were converted into European currencies in one day. In the late 1970s, daily turnover around the world was estimated at \$ 100 billion; a decade later, that figure had reached \$ 650 billion."⁴⁹

Given that wars among the major capitalist powers are not a very likely prospect in the near future (only because of what is now at stake – a globally integrated economic system of capital accumulation – and not because of the political features of liberal regimes as bourgeois political scientists maintain), and that the trends in the world economy described above are almost certain to continue (it is hard to

imagine capitalist states imposing the discipline necessary on financial capital to alter the course of the economy), it is interesting, to say the least, to see how capitalists will try to resolve the current global crisis. Either way, what is certain is that the toiling masses worldwide will continue to bear the burden of the 'restructuring' of the capitalist system as long as the system lasts.

(6) *Imperialism dominant feature in relations between advanced and less developed capitalist states:* The subordination of eastern Europe and the ex-USSR to western European and US capital evidenced in the pillage of their economies and the increasing penetration and subordination of the Chinese market by Japan, Hong Kong and Taiwan, are testimony to the fact that global expansion – imperialism – is the driving force of our epoch. Global capital accumulation creates dependent relationships without exception and subjects all national economies in the less developed countries to the interests of foreign capital, the logic of the 'world market', and the geo-strategic considerations of the imperialist powers (as former Yugoslavia so tragically illustrates). The newly created neoliberal global order is oriented toward a course that hardens the controls of the imperialist powers over the third world (which now includes the overwhelming majority of eastern European nations), closes all possibilities for inward and autonomous oriented policies of development, and ensures the continuation of the pillage of the third world's natural and economic resources.

(7) *Class struggle as motor force of history:* The major terms in practically every political discourse today are 'competitiveness' and 'labour flexibility', expressions that describe wholesale shifts in the labour capital relationship. For the past two decades, the capitalist class and its state representatives have engaged in a virulent class war converting permanent workers into temporaries, shifting work rules and, most important, taking absolute control over the conditions of work. The minimum response by labour and trade unions to this class struggle (its one-sided nature) does not obscure the essence of the process, a struggle by a class (the dominant) to impose its power and prerogatives over another and establish unilaterally the terms of production and reproduction. Indeed, the central and most immediate political task facing the working class movement and the parties of the left everywhere around the world is to return to the tradition of resistance and rebellion so as to push the world away from the orbit of capital's rule and toward equality, freedom, dignity, and justice.

(8) *Class nature of the state:* The overwhelming emphasis of state policy has been to facilitate the major economic process undertaken by the dominant capitalist class. The 'restructuring' of labour has been promoted by state policies weakening labour unions. Capital moves have been subsidised by state tax policies, capital concentration by state 'deregulation'; the 'transfer' of private losses through state intervention to the public treasury. "The major shifts in income based on the power of the state to intervene on behalf of capital has reduced its 'legitimation' function to minor activity. The state is not an autonomous entity mediating between classes. It is, as it has always been, an instrument of class rule and thus its major decisions can best be understood in the framework of its class character.

In sum, the directions of change, the dynamics of state-civil society relations, the process of international expansion, the structure of the market, and the emerging organisational forms of the principal socio-economic actors can best be understood in a Marxist framework. In the free competition of ideas, key Marxist concepts have demonstrated their validity over and against the liberal neoclassical paradigms. Yet the comprehensive explanatory power of Marxism is not sufficient to come to terms with the contemporary world unless it recognises the vast changes that have taken place both within its 'historical categories' and outside.

WORLD HISTORICAL CHANGES: CHALLENGE TO MARXISM

Vast changes have taken place over the past two decades in the class structure, in the labour process, in the application of technology, in the structure and organisation of capital, in the ideology and organisation of classes, in the family and in the organisation of cities, and in the organisation of power in the global political economy.

(1) In the advanced capitalist countries and in major regions in eastern Europe, Latin America, the ex-USSR and Africa, stable wage workers and stable long-term large-scale capital investors are a shrinking minority. There are significant variations in the 'post-industrial' labour force. In the advanced capitalist countries there is a growing number of low paid temporary 'contract' wage workers¹ and professionals in the services. High technology means of production and/or distribution are run by low paid service workers and 'maintained' and 'directed' by a thin strata of permanent high paid workers and executives. In the third world a growing mass of low paid 'self-employed' service workers operate as

distributors of cheap goods and are available as low paid rotating productive labour. The 'proletarianisation' of labour has advanced to such a degree as to create its opposite – a de-proletarianised surplus labour force.

(2) The combined development and interrelationship between capital intensive hi-tech and labour intensive sweatshop labour has produced a global chain of production and alternative investment strategies for capital. The so-called 'globalisation of production' – the movement of capital across national boundaries – has been accompanied by a selective investment of capital 'inward and downward', exploiting the movement of displaced and/or 'immigrant' labour within national boundaries. The concentration and centralisation of capital on a global scale and the development of new technologies is accompanied by the revival of pre-capitalist modes of production based on the extensive exploitation of labour.

(3) The 'strengthening' of the nation-state as an instrument for the international expansion of capital has been accompanied by the erosion of the national economy which sustains the international activities of capital and state. The diversion of resources – state and private – to 'global markets' has led to the fiscal crisis of the state and massive cutbacks in salaries and social spending. As global competition increases, domestic society deteriorates.

(4) The decline of wages of male labour has led to the massive entrance of female labour into the non household workforce to avoid immiseration. The expansion of production of food, clothing and electronics in low wage third world areas and their importation into the advanced capitalist world provides low priced consumer items, thus 'compensating' for wage declines. Lower paid wage earners in the west still have access to consumer goods despite decreases in income because of low price consumer imports and easy credit.

(5) Over time, however, low cost imports are displacing low wage production workers and limiting their access to goods and services. The 'second stage', from the declining wage, low cost consumerism to low wage declining consumerism phase, is part of the transition from phase one of 'free-market capitalism' during the 1980s to phase two in the 1990s.

(6) In the US changes in the labour process have not only displaced black and white wage workers but have significantly affected salaried professionals, employees and technicians. The decline of the middle class is evidenced in the erosion of stable well paid employment with health and pension benefits and the emergence of temporary contract labour among professionals, executives and others. 'Objective' proletarianisation of the middle

class, however, is not accompanied by any 'subjective' recognition of the causes and common conditions – there is an absence of any sense of class solidarity. Past class experiences weigh heavily on consciousness. The politics of class resentment at 'falling' is much stronger than identification with the new class 'brothers' and sisters in the same class position.

(7) The demise of Sovietism and the transformation of social democracy into a vehicle of neoliberalism has undermined a traditional reference point for working class and welfare politics. Moreover, the absence of the communist welfare model has reduced pressure on the capitalist states to sustain welfare policies in the west. The emergence of ex-communist and ex-social democratic spokespersons for neoliberalism has added 'authority' to the argument that there are 'no alternatives' to 'free market' capitalist. The dramatic ideological shifts and the discrediting of the previous social democratic and communist ideologies require a new ideological discourse.

(8) The international movements of capital have drained the nation-state of revenues and lowered wages, thus generating a fiscal crisis – the growth of fiscal deficits that in turn become a pretext for the reduction or elimination of the 'social wage'. The 'redundancy' of labour in the hi-tech and de-industrialised economy becomes an incentive to lower investments in education of health and housing. Exploitation of the domestic economy becomes a necessary condition for sustaining empires.

(9) The re-organisation of the labour process has greatly transformed the relation between capital and labour. Capital is eliminating multiple layers of management and administration between the top executives and production workers to lower costs. The remaining managers and engineers are increasingly part of the labour force on the production floor. The differences in income, power and prerogatives remain, but the hierarchy of production has been transformed and the immediate managers are more integrated into the workplace. The superfluity of the 'white apron boys' in production means less waste for administrative overhead expenses. Under capitalism this means more profit and less cost. Under socialism it would mean less hierarchy and less cost to the consumer. The labour process is moving away from direct supervision of labour and toward greater worker autonomy in the design and production of the total product. Under capitalism this new autonomy is subordinated to the strategic goals of the chief executive officers (CEOs). Yet it is transparent that the modern firm functions with less capitalist direct

intervention. The logical extension of worker autonomy from the shop floor upwards provides a powerful argument for self-managed socialism. Briefly, capitalist rationalisation of the work process toward greater worker autonomy contains the seeds of its own transcendence.

(10) New technology and information systems have greatly transformed work relations, the labour process and income distribution within the framework of and parameters defined by the dominant forms of corporate capital. Electronic networks and information systems extend and widen the scope and increase the speed of large-scale speculative movements of finance capital across the globe: they do not exist as autonomous forces defining a new 'hi-tech' or 'information society'. Hi-tech information systems in the context of the ascendancy of financial, real estate and insurance capital provides more outlets for the speedy transfer of capital out of productive employment and hastens the de-industrialisation of labour, and the growth of rich investment bankers and low paid service workers.

(11) The massive entrance of female workers into the labour force, at a time when wages are declining, social services are being eliminated and labour mobility is a forced condition for employment, is heightening conflict in the family and slowing redefining the content of working class socio-political agendas. The 'feminisation of the labour force' means that the old 'emotional division of labour' no longer operates, both partners suffer the same 'emotional stresses' at work, both lack emotional cushions at home! The inequalities and stress in the workplace can result in greater solidarity and equality in the household or more frequent and violent ruptures – depending on whether the aggression is centred externally or internally.

(12) Hi-tech monopsony industries (particularly those industries dependent on the US military as their single buyer) are extremely vulnerable to severe crises. Hi-tech industries whose technology is designed to produce very specialised products are subject to political exigencies of the buyer and the obsolescence of their products. The non-adaptability of the hi-tech to new marketable products can lead to the closing down of entire firms and to the outmodedness of the elaborate technology. The example of a fully automated/robotised plant producing million dollar sonars for the military is a case in point: when the military budgets declined, as the cold war ended, naval demand for sonars ended, factories were closed, and the highly skilled labour force became redundant. The downward mobility of the new hi-tech labour force in

aeronautics and related military industries defines part of the new class realities.

CONCLUSION

The political meaning of these major transformations is clear: the old class cleavages between stable industrial labour and industrial capital no longer define the 'basic relations' in society. The growth of temporary labour and the massive cutbacks of private corporate and state subsidised programmes cannot be confronted by a minoritarian labour movement, least of all at the bargaining table. The transformations have profoundly altered the context and content of class struggle – and to ignore these changes will certainly condemn Marxism to irrelevance. The answer to these changes – and detailed responses are obligatory – are only slowly emerging.

In the first instance the sharp distinctions between state and civil society no longer exist – capitalism thrives on exploiting the state (and the mass of working taxpayers). The fundamental problem then is the focus on the class state as the target toward which social movements must orient. Theorists of 'identity politics', cultural 'post-modernists' and advocates who focus on a distinct anti-state ideology in the name of civil society must be firmly rejected. The state must be viewed as a major resource and lever for change. This view must be accompanied by an approach which minimises bureaucracy and maximises the redistribution of resources within civil society.

Second, the 'national economy' must be seen as the starting point for any political confrontation with the internationalisation of capital. The rhetoric of globalisation ('global competition', 'global market place') which serves to reduce wage levels toward the lowest international levels, while encouraging the import of the products of low wage labour, must be countered by a strategy which blocks the diversion of local profits overseas. Measures ranging from capital controls to outright expropriation can become centre pieces for the reconstruction of a labour force capable of fighting on a level playing field.

Third, bridges of international labour solidarity must replace protectionist walls to effectively homogenise labour conditions upward, to counter the 'internationalisation' of capital.

Fourth, technological changes require new social agencies to re-direct their application, their locus and impact. The growth of autonomous workplaces must extend to the application of technology – reducing work time and increasing employment.

Fifth, the feminisation of labour requires a cultural and social revolution in the labour

and feminist movements – toward a broad-based social agenda that incorporates large-scale, long-term shifts in budgetary allocation to family allowances and shifts from symbolic to substantive representation. The challenge to the 'competitiveness' ideology must grow from the solidarity of competent and productive forms of social organisation, not from the escapist yuppie leisure culture or from utopian intellectual nostalgia for counter-cultural styles.

Traditional loyalties and solidarity at the primary and personal level must be respected, and multicultural life-style politics cannot be assumed to be a superior form, particularly in its emphasis on 'immediacy' and 'transitoriness', phenomena more akin to contemporary capitalism than to its subversion. Marxism must include tradition and revolution, nationalism and internationalism, class solidarity and individual intimacy, as essential elements to the new politics, to remain relevant.

Notes

- 1 This is slightly based on the theoretical argument that the workings of the transnational activities of capital are reviving the classical features of capitalism. - 39 As the *Financial Times* observed on the mood of the Europeans toward the US in 'Living with US Trade Policy', April 5, 1993, "Washington's self-righteous indignation over the sins, actual and alleged, of its trading partners is both irritating and depressing" (p 15); cited in *ibid*, p 120.
- 40 See, for example, Craig R Whitney, 'A Testing of NATO: US and Europe Adrift in Balkans', *The New York Times*, November 24, 1994, p A8; and Roger Cohen, 'Two Roads: Bosnia Makes Atlantic Unity an Oxymoron', *The New York Times*, November 27, 1994, pp E1, 3.
- 41 This discussion is based on that of Makoto Itoh, *The World Economic Crisis and Japanese Capitalism*, pp 176-79. Itoh maintains that Japanese capitalism has been in a severe economic crisis since 1973, based on the economy's performance before 1973 when annual rates of growth were around 10 per cent, compared to 3.7 per cent annual average rate of growth between 1973-84, but seems to suggest that it has not been as spectacular when compared to the severity of the crisis in the European and US economies. But he also argues that since the late 1980s, the crisis of Japanese capitalism has reached newer dimensions and has become much more severe.

- 46 Arun Ghosh, 'The Demise of Fabian Socialism – and of Market Capitalism', *Economic and Political Weekly*, Vol XXIX, No 21, May 21, 1994, p 1255.
- 47 A term coined by Susan Strange to refer to the speculative trends in the world economy during the 1980s. See Susan Strange, *Casino Capitalism*, Basil Blackwell, Oxford, 1986.
- 48 See Barry Rehfeld, 'Soros's Alter Ego: Low Profile, Very High Returns', *The New York Times*, April 18, 1993, p F8.
- 49 John B Goodman and Louis W Pauly, 'The Obsolescence of Capital Controls? Economic Management in an Age of Global Markets', *World Politics*, Vol 46, No 1 (1993), included in *International Political Economy: Perspectives on Global Power and Wealth*, 3d ed, Jeffrey A Frieden and David A Lake (eds), St Martin's Press, New York, 1995, p 303.
- 50 Thus, as Thomas Kavier reports in his *Beyond Competition*, while US corporate income tax accounted for 23 per cent in 1960 of federal income outlays, it dropped to 8 per cent in 1986, p 191.
- 51 According to Vijay Prashad in 'Contract Labour: The Latest Stage of Illiberal Capitalism', *Monthly Review*, Vol 46, No 5, October 1994, temporary jobs in the US increased in the 1980s by some 25 per cent (p 20).

Reconsidering Postmodernism

What Is New in the Old Lamp

Gurpreet Mahajan

This paper argues that the value of postmodernism derives from its power of negation. Its critique of objectivism and the 'metaphysics of presence' offers a new philosophical framework within which elements of the early critiques of enlightenment/modernity can be incorporated and given a more comprehensive form and analytic depth. However, when the concepts employed in the critique are transformed into affirmative norms, they yield an attitude of scepticism and nihilism within which every kind of 'coherent' and 'meaningful' enquiry becomes suspect. Consequently, to retain at least some of the philosophical insights of postmodernism, we need to make a distinction between its potentialities of negation and its norms of affirmation. We need also to rethink the concepts through which anti-foundationalism is given a positive content.

I

THE ascendance of postmodernism was perhaps the most striking intellectual development of the 1980s. A few theorists – most notably, Jameson and Harvey – represented it as the culture of late/post-fordist capitalism, however, others registered its significance in different terms. They associated postmodernism with an anti-foundational intellectual agenda. Over time, this perception seems to have prevailed, and today postmodernism derives its staying power from this theoretical orientation enunciated in the philosophies of Jacques Derrida, Richard Rorty, Gilles Deleuze and Francois Lyotard. While the analytical perspectives of the two sets of writers were significantly different, what is important is that they emphasised similar concepts and values. In many cases, the attributes of the postmodern condition, described by the former, were identical to or supportive of the philosophical values stressed by the latter. For instance, Harvey's reference to the relative insignificance of class conflict and the primacy of exchange over production relations, reinforced the theoretical critiques of Marxism as a 'metanarrative'. Similarly, references to the emergence of new class alliances and antagonisms supported the anti-foundationalist disbelief in a single project of human emancipation. It also helped to question the designation of the working class as the revolutionary subject of history. At least indirectly, the identified changes in capitalism endorsed the idea of plural projects of emancipation. Similarly, the slogan, 'think globally, act locally', characteristic of the postmodern condition, echoed the philosophic emphasis on 'local determinism' and local management [Lyotard 1987: xxiv]; and the pursuit of diverse tastes eclectically (now possible with satellite-based communication) represented the philosophic emphasis on diversity, difference and fragmentation. Thus, while the analysts of the postmodern condition pointed to the emergence of a new set of cultural and aesthetic norms, its philosophers provided a methodological justification of these values.

Collectively they effected a profound change in the intellectual mood and language of academic discourse. Indeed they created an environment in which rationalist beliefs that characterised scientific enquiry since the time of Plato were questioned and undermined.

Yet, surprisingly enough, the euphoria generated by this intellectual revolution was short lived. Even as scholars continue to use post-structuralist language, journals abound with critiques of postmodernism, and its chief protagonists are now questioning the idea of postmodernism [Lyotard 1991:25; Heller and Feher 1988:10-11]. What has brought about this change in attitude? Why are scholars distancing themselves from this intellectual programme? Was postmodernism just another language popular among the new radicals? What does one do now in the face of changing intellectual fashions? Does one abandon postmodernism *in toto*? Are there valuable insights in postmodernism worth retaining even after the intellectual climate has changed?

Prompted by these questions this paper tries to understand what Banu Helvacioğlu so appropriately called the 'thrills' and 'chills' of postmodernism (1992). Instead of dismissing this contemporary 'ism' as an intellectual trend, favoured more for its seductive language than philosophic norms, the argument put forward here is that postmodernism, despite its inconsistencies and retractions of its adherents, represents a distinct theoretical and intellectual agenda. The initial euphoria and the subsequent fears that it generated can therefore be comprehended only by reflecting upon the ensemble of concepts that represented this agenda. Undoubtedly, the popularity of post-structuralist language, the methodologically indiscriminate appropriation of some of its concepts, the compulsive and needless use of spatial metaphors, the language of 'construction' and 'dislocation', even by those who are aspiring to true explanations and accurate representations, can only be described as an intellectual fashion. However, as a general explanation this statement remains inadequate because it reduces

intellectual preferences to the vagrancy of individual whim and chance. By comparison, the argument that postmodernism is the cultural manifestation of late capitalism makes better sense. It explains at least the currency of postmodern intellectual and aesthetic norms, however, it too remains unsatisfactory as it is unable to account for the retreat of postmodernism in the near same environment and epoch.

Recognising the limitations of these explanations this paper approaches the question of the ascendance and the relative decline of postmodernism differently. It locates the problem in the ensemble of concepts that form the core of the postmodern intellectual agenda. To make this point more fully, the following pages begin by delineating the distinctiveness of the postmodern intellectual agenda. It then examines the theoretical and political possibilities generated by the conceptual package that defines this agenda, and points to the ways in which these concepts have been interpreted and appropriated in contemporary society. Through a consideration of these aspects, it is argued that the value of postmodernism derives from its power of negation. Its critique of objectivism and the 'metaphysics of presence' offers a new philosophical framework within which elements of the early critiques of enlightenment/modernity can be incorporated and given a more comprehensive form and analytic depth. However, when the concepts employed in the critique are transformed into affirmative norms – symbolising a mode of being and analysing – they yield an attitude of scepticism and nihilism within which every kind of 'coherent' and 'meaningful' enquiry becomes suspect. Although subsequent readings and appropriations are, in the main, responsible for this predicament, yet, in so far as room for such readings was provided by the initial terminology and concepts, postmodernism as a whole is now being challenged. Consequently, to retain at least some of the philosophical insights of postmodernism, we need to make a distinction between its potentialities of

negation and its norms of affirmation. We need also to rethink the concepts through which anti-foundationalism is given a positive content.

In making this argument, this paper paints a composite picture of postmodernism. Instead of isolating the various philosophical strands within postmodernism, it focuses upon those concepts and philosophical orientations through which we can grasp the particularity of the postmodern way of thinking. Further, it elucidates these concepts by borrowing selectively from the writings of its adherents who belong variously to the pragmatist and the post-structuralist tradition. Not all theorists referred to in this presentation identify themselves as postmoderns - for instance, Derrida himself did not claim to be postmodern - yet, insofar as their ideas have been associated with and described as postmodern, they have been freely utilised here. Before beginning our discussion of postmodernism it is perhaps necessary to reiterate that this paper is not about the thought of a particular philosopher; hence it ignores the changes, shifts, and contradictions in an author's position. It uses particular texts and utterances selectively to illuminate aspects of the intellectual agenda that defines postmodernism.

II

Postmodernism symbolised a complete and radical critique of the essential attributes of enlightenment rationality and of those aspects of modern social and intellectual life that grew out of it. On the one hand it questioned the pursuit of universal and absolute knowledge, grand explanatory schemes and general theories of historical development, and on the other, it challenged the enlightenment's belief in the existence of underlying essences and unified entities. Thus, distancing itself from the enlightenment, postmodernism focused upon the local and the particular. It questioned both the validity and the necessity of universalising narratives and argued that the logic of these metanarratives was totalising. Historically, these narratives concerning the creation of wealth, dialectic of the spirit, and the emancipation of the rational or working subject, had led to imperialism and totalitarianism - Fascism and Stalinism being the most recent examples of it [Lyotard 1987:x, xxiv]. Methodologically too, these self-legitimising theories were deeply flawed. Their quest for a universal, unchanging essence obscured the particulars in history. It obliterated 'proper names' and all other forms of particularisms. Further, it assumed, quite mistakenly, that particular narratives could give rise to a "single world of names and to a universal narrative" of which humanity in general was the subject [Lyotard 1988:155].

The grand narratives of the enlightenment, according to the postmodernists, rested on the mistaken belief that history, society, the human self and God, have an 'intrinsic nature' and an identifiable coherent essence. The postmodernists argued that there is no such thing as intrinsic nature, an objective reality or an accurate representation of the world as it is in itself. Just as there are no universal laws of history operating independently of particular agents, similarly, there is no truth out there, existing independently of the human mind, waiting to be 'discovered' [Rorty 1986a]. All claims about the nature of the world are embodied in language and mediated through our theoretical paradigm. Hence, we never know the world in itself, what we see and know is the world as it appears to us through the lens of our paradigm. Our descriptions of the world are not therefore mirror images of the world outside, instead they are human constructs, devised, used and judged by their capacity to perform certain tasks.

Postmodernism offered this view of the world and the cognitive process as a refutation of the empiricist conception of science and the enlightenment's quest for philosophic or scientific certitude. The former assumed that there is a world out there, existing independently of the knower, which is accessible to us through sensory perception. Science makes that world available to us. Through systematic observation and generalisation, it is argued, science offers us an accurate description of it. The enlightenment theorists accepted this view of science and maintained that the technological success achieved in the sciences was evidence enough of the truth of its descriptions. Accordingly, they argued, if social science wishes to achieve a parallel degree of certitude then it should seek out causal explanations and general laws of temporal succession and co-existence [Buckle 1930, Bury 1970].

Each of these assertions was challenged by postmodernists. Science, they argued, is just another human activity comparable to literature and politics. To quote Rorty, "Great scientists invent descriptions of the world which are useful for purposes of predicting and controlling what happens, just as poets and political theorists invent other descriptions of it for other purposes" [Rorty 1986a:3, emphasis added]. The idea that there is some truth that can be discovered by scientific observation or philosophic reason was, for the postmodernists, a legacy of an age in which the world was seen as the creation of a Being who had a language of Her own. It assumes the existence of a 'super vocabulary' through which the divine project can be described and represented. For the advocates of postmodernism, both these ideas stemmed from the fundamental belief that there are non-linguistic things

called 'meanings' and 'essences', and the task of language is to express these meanings and represent these essences. Above all else, the postmodernists questioned this conception of language itself. We must, they argued, drop the idea that language is a system of representation.

A number of conclusions followed from this assertion: (i) It was no longer appropriate to speak of a language as being adequate or inadequate representation of the world or the self. (ii) It suggested that all languages are human constructs and they mediate our descriptions of the world. (iii) Since the world does not propose a language for us, it does not also tell us which language to use and which language game to play. (iv) The choice between one language game and another can neither be explained in rational terms nor grounded in 'algorithmic certainty' [Laclau 1990:188-89]. There are no 'foundations' or 'universal rules' that can serve as common ground for adjudicating between diverse knowledge claims and descriptions of the world [Rorty 1982:317; Lyotard 1988:xi]. (v) Truth is a property of linguistic entities and it does not refer to an accurate representation or a mirror image of the world. (vi) To talk of the nature of truth, like that of God or self, is an unprofitable subject. (vii) There are no absolute referents in the form of 'intrinsic nature' or 'pure essence', and there is no sacred meaning that can give direction to our deeds. Meaning is, therefore, an object of self creation, it is to be made, not discovered [Rorty 1986a and b].

Meaning, for the postmodernists, could be created because there is no transcendental signified and, therefore, no absolute meaning. But even more significantly because the signifier and the signified are separated from each other: there is a 'distance', a 'space' between them [Derrida 1976:68-69; 1982:9]. Although the postmodernists accept that the signifier can signify only if it bears some relation to the signified, yet, from their perspective, the important thing is that the signifier is characterised by a 'surplus'. That is, it supplements the thing itself [Derrida 1976:144-45]. It neither exhausts nor is exhausted by the signified. Since the sign is not a representation or a copy of the signified, it cannot be reduced to a single identifiable object or meaning. All we can say about the sign as a text is that it resonates with several meanings. Like any form of 'gramme' (graphie or writing), it transcends its author and the point of its origin [Derrida 1982:317]. Its meaning is, in other words, not exhausted by the author's intentions or the particularity of the historical context.

Postmodernism suggested that the reader/analyst must approach the text with this awareness of the 'arbitrariness' of the sign and the indeterminacy of meaning. This implies that the search for a unified coherent

meaning within the text must be given up. In fact, one should not see the text as a unified single whole. Instead the focus should be on the inconsistencies and the contradictions of meaning in the text, perhaps by reflecting upon the metaphors in the text and drawing upon other possible meanings of the words in the text – meanings that may not have been intended by the author. To this end the reader could use the strategy of hyphenation, or else, refer to other words with which a given word shares a common root, linguistically or even phonetically. In addition to linking meanings present in the text with those that are absent but can nevertheless be traced to it, the reader could question, reverse, or displace existing hierarchies and oppositions in order to insert, what Derrida calls, the 'critical text' into the reading.

A reading of absences and the insertion of new meanings are the twin strategies employed by postmodernism to emphasise that knowledge is not a system of 'tracking down' or 'discovering' truth. It is instead the field of "freeplay... a field of infinite substitutions in the closure of a finite ensemble" [Derrida 1976:51]. In other words, these were strategies of deconstructing (as distinct from reconstructing) a text, offering ways of transcending the conceptual closure imposed by the metaphysics of presence. Together they show that no matter how hard we try, our reading will always remain incomplete; there will always be an 'otherness' – a residual content – that escapes and cannot be appropriated by us.

The epistemological space provided for the other in the postmodern project symbolised a political and philosophical perspective in which freedom, diversity and plurality were the core norms. "The irreducibility of the spacing", wrote Derrida, "is the irreducibility of the other" [quoted in Bannet 1989:223]. Its presence signified the need to open the logos of the white man and create space for the 'other' in it. In more general terms, it represented an attitude of tolerance and respect for the other. On the one hand it assumed that "[I]t is precisely in losing the certainty of truth and the unanimous agreement of others that man becomes an individual" [Rorty 1989:18], and on the other, it upheld values through which "individuals and communities could co-exist peacefully with other individuals and communities", while also putting together "new syncretic, compromise ways of life" [Rorty 1990:1].

The postmodern celebration of difference and otherness was, in a way, an expression of limits. At the epistemological plane, it revealed the incompleteness of our reading and knowledge, and at the political plane, it expressed doubt in the human ability to shape the present and the future. Its adherents spoke variously of powerlessness,

disintegration and absolute contingency as the human predicaments. However, it is significant that recognition of ourselves as 'centreless, random assemblage of contingent and idiosyncratic needs' did not induce in them a sense of despair or pessimism. Some even celebrated the absence of narrative continuity and the condition of schizophrenia; others maintained that a framework within which incoherence and ambiguity were positive values would herald a complete rejection of the totalising discourses of the 19th and the 20th centuries: indeed it would assist in waging a 'war against totality' and the associated 'nostalgia for the whole' [Lyotard 1987:81-82]. In contemporary times too, it would be an equally important instrument for resisting the Habermasian desire for a perfect 'dialogical' society possessing 'communicative competence'. Such ideals that favoured "argumentation with a view only to consensus (homologia), the unicity of the referent as a guarantee for the possibility of agreement; parity between partners, and even an indirect recognition that it is a question of a game and not a destiny, since those who refuse to accept the rules, out of weakness or crudeness, are excluded" [Lyotard 1987:28] were, in their view, new enunciations of the 'terrorist ideals of consensus', and needed to be opposed firmly.

The postmodernist ideology of self-creation and difference was, in this way, envisaged as an alternative to the existing modes of oppression and domination. It supplemented the critique of scientism, bureaucratic centralism, instrumental rationality with that of philosophical foundationalism. In place of these ideals, it spoke of locality, practical knowledge and political foundationalism. As postmodernism challenged the search for certain indubitable and foundational premises about human nature and self on which democracy could be grounded, it maintained that we can only offer 'apologetics', not 'justification' for our social and political choices [Rorty 1986c]. That is, we can offer arguments that make our choices comprehensible but not an argument that can settle all disputes and differences conclusively. Our choices and political preferences have to be argued, we have to recognise their relative validity, and yet, stand up for them unflinchingly. We must be equally prepared to "call true whatever the upshot of such encounters turns out to be" [Rorty 1986c]. In other words, whatever be the outcome of political contestations and ideological battles, they should be accepted as the relative truth for that society. In the absence of philosophical justifications, solidarity among the members in a society cannot be assumed; it has to be expressed and continuously renewed. And what is even more likely is that solidarity would, on most occasions, have to be forged

among the members of a group who share a set of commitments and political-social preferences. Since there are bound to be differences among members of a society on this issue, we need a form of 'civil association' (i.e. *societas* as opposed to *universitas*) which allows these differences to be expressed and respected [Rorty 1980:318].

On other occasions, arguments about the absence of absolute justifications were used by postmodernists to support the diverse projects of emancipation – e.g. those expressed in the struggles of women, gays, environmentalists, blacks, immigrants, indigenous people, etc. Some postmodernists were optimistic that these diverse and heterogeneous projects would fit together in a kind of 'rainbow coalition', supporting each other and the cause of 'radical democracy' [Laclau 1990:125]. Others, however, endorsed a weaker position: they pointed to the validity of diverse rationalities and projects. In the context of the eurocentric logos of enlightenment rationality, these theorists celebrated the ethnic and the oriental. 'Ethnos' became an authentic and primary category in their social analysis and an expression of their pluralistic stance. Harvey expresses it well when he writes, "that groups have a right to speak for themselves, in their own voice, and have that voice accepted as authentic and legitimate" [Harvey 1989:48]. The preference for the ethnic and the cultural indigenous was manifested in every sphere of life: in architecture, for instance, ethnic designs and structures were used freely and eclectically to redefine space.

In sum, postmodernism was an expression of ontological and epistemological anti-foundationalism. It questioned the existence of a transcendental signified, and, with it, the philosophic preoccupation with discovering truth. Emphasising self-creation and difference, it substituted the desire for certainty and coherence with the notion of ambiguity and freeplay, and inserted the idea of an absent presence in the discourse of western metaphysics.

III

This paper began with the observation that postmodernism symbolised a total rejection of the enlightenment rationality. While the statement can serve as a minimal definition of postmodernism, its very parlousness does not tell us what is distinctive of postmodernism. After all there were other schools of thought, prior to postmodernism, that were critical of the enlightenment rationality. Historicism, Hermeneutic Romanticism, Critical theory and post-empiricist theories of science, were challenges to the enlightenment. In what way was postmodernism different from the

earlier challenges? Did it supplement these critiques? Was it significantly different from them? This section addresses these questions. It refers to the early critiques of the enlightenment with a view to understanding the philosophical hiatus between them and postmodernism. References to these other critiques should not however be seen as an examination of the origins of postmodernism, or for that matter, its intellectual inheritances. For one, postmodernism never acknowledged these schools of thought as its intellectual predecessors; and two, it consciously distanced itself from them. In some cases it placed these critiques alongside enlightenment and subjected them to the same critical scrutiny. Consequently, in consonance with the dictates of postmodernism, what follows is not a story of 'origins'; if it tells a story at all, it is about the diverse human projects of emancipation.

The enlightenment continued the post-renaissance struggle for the secularisation of the social by using reason and science as its allies. The latter were the instruments by which the enlightenment sought to dismantle what it considered to be the 'illusory', 'metaphysical' and false nature of traditional religious orthodoxies and beliefs. In more positive terms, both reason and science were used to furnish a rational view of the world, human history and the self: a view which supported and furthered the ability of individuals to control and manipulate their environment so as to pave the way for a 'good' and 'rational' society.

Some of the categories of enlightenment thought, expressed in the writings of the English and the French theorists, were questioned in the mid-18th century by the German historians and philosophers. While many of them challenged the centrality given to reason by arguing that 'will', not reason, was the motive force of history, others redefined the concept of reason. Instead of positing a dichotomy between reason and tradition, they argued that reason was not an innate quality of the human mind. It was a product of development, tempered by tradition and nourished by the human will. More importantly, these German historians questioned the enlightenment belief in a single pattern of national and individual growth. Industrialisation and democracy were the twin norms in terms of which the enlightenment had made a distinction between the dark ages and the brighter, enlightened present, and further, between the advanced English and French society and the 'sick', 'backward' German society. The German historians questioned this characterisation of their society. Analysing the reasons for their present predicament, they argued that the history of humankind presented a succession of heterogeneous cultures, each complete in itself with its own set of values and cherished goods [Herder

1969:188]. Diverse societies and cultures were, in other words, incommensurable and no single criterion, particularly one borrowed from our present stage of development, could be a valid basis for judging these diverse cultures [Herder 1969:231]. To put it differently, the previous cultures could not be seen as a stepping stone for the evolution of the present; nor could the latter be a privileged vantage point for judging the past. Each social-cultural way of life had to be understood in terms of the values internal to it. To this end, Herder suggested that historians study the culture from the 'inside', by reconstructing its various aspects of life. Setting the trail for others, he in fact collected the myths, folklore and literature of the people of the highlands who were still dominated by the medieval traditions and forms of life. Thus, Herder in association with other historians, questioned the enlightenment reading of history and its arrogant dismissal of previous ways of life as barbaric or primitive. In its place, they offered and cherished the ideal of diversity and irreconcilable heterogeneity. Almost a century and a half later, this was the perspective from which social anthropologists recovered and redeemed the rationality of the colonised and tribal cultures.

The German historians also questioned the methodological orthodoxies of the enlightenment by emphasising the distinction between the natural sciences and the human sciences. The enlightenment theorists had endorsed the empiricist conception of science and advocated the extension of the methods used in the study of the natural phenomenon – e.g. search for empirical generalisations and causal explanations – to the study of the social phenomenon. From somewhat different perspectives, Wegelin, Gatterer and Chladenius rejected these beliefs. Wegelin argued that natural sciences were concerned with immutable, transcendental principles governing the world of matter, while the historical sciences analyse the changing, semi-free products of the human spirit [Reill 1975:119]. Similarly, Chladenius distinguished between historical and dogmatic explanations. The former, he argued, investigate both the external world and the inner world of human values, while the latter deal only with the world external to man [Reill 1975:106-07]. Both these historians questioned the belief that mathematics and the natural sciences provide a universal model for scientific analysis. In its place they maintained that historical knowledge was an equally important and scientific form of enquiry, albeit dealing with different order of reality.

Further, by referring to history rather than the human/social sciences, the German historians suggested that history, not philosophy, was the queen of human sciences; while all other disciplines deal

with an aspect of human life, history dealt with women and men of all ages and all times. Subsequently, other arguments were woven into this perspective. By the end of the 19th century some theorists interpreted this statement to stress the study of the process of development, from its moment of origin to its present stage; others pointed to the changing nature of things, and consequently, emphasised contextualism. Hegel went a step further. He saw history as the expression of the absolute/transcendental behind the contingent. History, he said gives a determinate form to the Absolute Idea and represents a mode of self-understanding and self-awareness.

Setting aside these differences in readings, the point to note here is that the enlightenment conception of universalism and the associated belief in a single, all-encompassing unity was displaced in the mid-18th and early 19th centuries, by a more complex vision of historical diversity, heterogeneity and the presence of contingency. Romanticism, in particular, emphasised the latter. While it reversed several other cognitive preferences of the enlightenment – e.g. reason with passion and intuition, cognitive certitude with doubt, prevailing optimism with scepticism about our ability to know and master the forces of nature, and the vision of historical progress with that of moral degeneration – it pointed to the contingent and man-made/chosen contexts which determined the destiny of man. The tragedy of human life was, for them, so much greater because it was self-imposed: that is, it was a consequence of our following our internal compulsions and passions. The romanticists distinguished themselves from the enlightenment 'Philosophes' in yet another way. While the latter were engaged in uncovering the true, objective nature of external reality and the human self, romanticists celebrated nature, subjective experience, feeling and desire.

In this context, the following three issues need to be emphasised: (i) Neither historicism nor romanticism questioned the existence of the transcendental and the universal. They merely altered the terms of discourse by owning and sometimes privileging the contingent and the heterogeneous. (ii) Herder and Dilthey historicised our perceptions. They replaced the idea of a pre-given, essential and invariable nature by an historically specific and culturally defined 'spirit' or nature. Instead of delineating a universal pattern of historical development, norms and ontological essence, they spoke of diverse patterns of growth, conceptions of self, morality and organisations of society. In other words, they historicised the notion of rationality and referred to the diversity of human projects. Even so, they neither abandoned the search for an objective truth nor did they consider it to an unattainable

goal. What they offered in lieu of the enlightenment and rationalist view of a single reality and truth was the idea of historically specific and culturally shared conceptions of reality and truth. To put this somewhat differently, they maintained that the social reality was, directly or indirectly, the product of human creation. Literally, it represented the objectifications of the human mind/spirit (*geist*). Further, they argued that each expression of the human mind was a unique particular. It presented a reality that was historically and culturally specific, i.e. it was characterised by particular modes of 'internal' and 'external organisation' that separated one life world from another [Dilthey 1988:105-14]. Thus, each culture embodied a set of values, conceptions of the self and the other, pattern of social, political and economic interaction and philosophical orientation. As members of a society, individuals share and express these orientations in their actions. The existence of a world of intersubjective meanings facilitated communication among the members of that society and reflected what might be called the 'spirit' of national and social life. Hence, while the social reality was taken to be a human construct, it was assumed that its distinctive cultural voice or historical spirit could be recovered. The search for an objective truth was therefore not abandoned; only the empiricist conception of objective reality and ahistorical truth was rejected. (iii) Dilthey endorsed the belief that historians/social scientists could arrive at the objective truth, albeit by understanding a particular expression (event/text) with reference to the 'objective mind' of that society" i.e. in terms of the complex of intersubjectively shared meanings and systems of organisation of life in that society [Hodges 1949:118]. In fact the historian was expected to recover from the text that meaning which the original addressee (the contemporaries of the author) would have recovered from the text [Mahajan 1992:55-59]. Since the historian was called upon to recover a meaning that members of a society (socio-cultural-historical entity) would have recovered from the text in accordance with the practices of shared language game, subsequent readings were expected to refine and reinforce that one and the same meaning. Objectivity was not, therefore, sacrificed, and disputes about the meaning of the text could, in principle, be settled.

In this way, hermeneutic philosophy gave up the notion of an essential and universal truth: it historicised our conceptions of life, human self, morality and society. Further, it legitimised the different patterns of rationality articulated in diverse historical-cultural units, and gave them respect and authenticity. Since philosophy as a form of enquiry tried to overcome the sense of difference and contingency, it relegated it

to a subordinate position, giving the pride of place to history. History came to represent both a mode of knowing and a mode of being. No longer were the historians expected to penetrate the veil of being to glimpse at the universal Being that must lie behind this plurality. Instead, their ostensible task was to recover the meaning that the original addressee would have derived from the text. Hence, neither the existence of the author nor her authority were denied or questioned. It was assumed that the author was, through the text, communicating with other contemporaries and was, therefore, using language in accordance with the norms/meanings shared between her and her contemporaries (the original addressee). The task of enquiry was therefore to reconstruct that language game in which the text was encoded. In contradistinction, romanticism spoke of forging a psychological unity with the author while simultaneously recognising the virtual impossibility of re-living the life of the 'genius' or, for that matter, the moment of creativity. Troubled by this paradox, it agonised about our ability to understand the text completely. Hermeneutic framework, on the other hand, overcame this dilemma by limiting understanding to the recovery of that meaning which the original addressee would have derived from the text. Recovering the author's original intentions or the moment of creativity was not a part of this enterprise.

Hermeneutic philosophy thus provided a critique of ahistorical and essentialist readings, and it also opposed what Rorty calls "bad foundationalism". However, it concerned itself only with those aspects of the enlightenment that applied to the human historical world; it did not, in other words, question the notion of natural science and scientific method that underpinned that thinking. The latter task was performed almost a century after by the post empiricist philosophies of science, whose most well known representatives were Kuhn, Feyerabend and Putnam. Each of them emphasised the place of interpretation and theory in scientific observation and theory formation. Perhaps the weakest expression of this view was present in the writings of Popper in the form of 'Searchlight theory', that is, the statement that what we see depends to a considerable extent on what the light illuminates [Popper 1966: 260]. While our perception is also to some extent shaped by the nature of the object on which the light is focused, the position of the subject and the nature of her concerns make a crucial difference to what is observed. Kuhn and Hanson made a stronger claim. They argued that we see the world only through some theoretical paradigm or grid. Consequently people with different paradigms see the world differently. It is not as if they interpret the same set of observed facts differently, but

that they see quite different facts. Besides, observing something means identifying it and giving it a name [Kuhn 1977: 463-80]. And naming a thing or categorising it involves the use of a disciplinary matrix. Consequently there is no way in which we can know the world in itself or say that the picture derived from a particular paradigm is an objective representation or a mirror image of the world outside. All knowledge, even that of the natural sciences, is mediated through conceptual schemas and subject to interpretation by the members of the scientific community [Hanson 1981:262-67].

Postmodernism endorsed these critiques of empiricist conception of science and it also shared the hermeneutic concern with meaning. It accepted the idea that there is no neutral and theory independent observation language: that all enquiry, including that of the natural sciences, employs a theoretical paradigm, and is subject to interpretation. Science's claim to represent pure objectivity was, therefore, a myth and the accompanying belief that scientific theories represent a mirror image of the world outside, completely erroneous. However, while endorsing these perceptions, postmodernism did not begin from the point where these post-empiricist or hermeneutic theories had left off. In fact, it chose a different starting point: it opposed the metaphysics of presence itself and argued that hermeneutic philosophy shared the methodological errors of the former. Dilthey, for instance, attempted to recover from the text a meaning that was pre-given; a meaning that was placed in the text by the author. In other words, he assumed the unity of the text and the presence of a coherent meaning. He placed a closure on enquiry by stipulating that the historian should recover the meaning of the text by reconstructing the objective mind of that society – that is, the original context of experience. The post-structuralist component of postmodernism, in particular, questioned the assumptions of such hermeneutic analysis. It argued for the autonomy of the text, and sought to free it from the constraints placed upon it by the author, the original context and the original addressee. It argued that meaning is always delayed, deferred and disseminated; further, it located the possibilities of critical reading in the idea that words do not have a single determinate meaning, and like metaphors in language, they invoke diverse images and meanings that can be used to reveal aspects of the text that might be lost in earlier forms of hermeneutic reading.

Thus, postmodernism displaced the hermeneutic faith in the recovery of a single, historically and culturally specific meaning with the twin ideas of indeterminacy of meaning and absence of closure. While these ideas, like hermeneutic philosophy and post-empiricist conceptions of science, offered a

critique of the enlightenment conception of history and science, they conceived the task of the human sciences quite differently. As we observed earlier, postmodernism questioned the search for a single unified, coherent meaning. It extended the critique of the idea of a universal truth to challenge the hermeneutic belief in the existence of an identifiable, single historical spirit and meanings. It further labelled the attempt to explain and delineate a distinct identity as being synonymous with the quest for foundations and essences. Consequently, while forsaking the latter, postmodernism stressed absolute contingency of the self, language and community.

IV

The preceding sections delineated the philosophical agenda of postmodernism and reflected upon the distinctiveness of its anti-essentialist perspective. This section dwells upon the ways in which the ensemble of concepts associated with this philosophy have been read and appropriated in the social sciences. In particular, it explores the implications of these readings for social analysis and political engagements.

Postmodernism, as we observed earlier, represented anti-essentialism and anti-foundationalism, that is, it opposed the twin concepts of essence and foundations, and maintained that there is no transcendental signified and no absolute spirit which can serve as the foundations of the world, history or the human self. At one level, this was an assertion about the absence of a supreme Being, but at another, it was a statement of the absence of epistemological foundations too. At the very least it suggested that, (a) it is futile and unprofitable to speak of a universal truth or the thing-in-itself; (b) what we know is the world as it appears to us through the grid of our theoretical paradigm, (c) our knowledge is not a representation of the objective world; it is instead a description of the world, presented linguistically, (d) there is no pre-determined human destiny or history. Further, there are no laws which determine the direction and outcome of the historical process; (e) the meaning of history, like that of any other text, can never be fully known. All together these assertions challenged and rejected the correspondence theory of truth, the empiricist view of science and the associated belief in a universal historical process. In a manner of speaking none of these enunciations were new or unique; the death of God had been proclaimed by Nietzsche; the neo-Kantians along with post-empiricist philosophers of science had stressed the theory dependent nature of knowledge; and the critics of Marxism had queried the idea of historical determinism. Hence, in making these assertions postmodernism was echoing the sentiments

of other non-foundational philosophies, without contributing anything significantly different or new. What distinguished postmodernism from the others in this category was the fact that it gave a positive content to the ideas of anti-essentialism and anti-foundationalism. That is, it did not merely reject the scientific rationality of the enlightenment, instead it questioned universalism *per se*. In doing so it provided an alternative conception of a text, be that the social reality, individual self or history. Hence, its distinctiveness resided in its particular conception of the text.

The postmodernist conception of the text was, in the main, grounded in the philosophy of Derrida, and its most fundamental feature was its multivocality. Further, this characterisation of texts was used to question hermeneutic readings, and to assert that all forms of inscription and writing lack an objective meaning. Let us begin our analysis with the first claim: namely, the multivocality of texts. Literally, multivocality implies the existence of multiple meanings. When applied to words, it suggests that words have more than one meaning. The diversity of meanings is manifest in the way words are used in different situations and historical epochs. Sometimes words acquire different meanings through their usage in different language games, and at other times, their meanings may vary over a period of time. Meanings then are, in this dual sense, context dependent, and the words to which they are attributed, multivocal.

Postmodernism used this idea of multivocality, previously associated with hermeneutics and structuralism, and gave it a new form. First and foremost, it maintained that multivocality is the defining feature of all texts. Being multivocal, these texts, for instance, individual life, humanity, history, culture, social action/structure, inscriptions, written documents, etc. do not address us in a single voice. Instead different meanings are embedded in each of these texts. Second, since texts are multivocal, reading should not be directed at the recovery of a single univocal meaning. In lieu of searching for a unified coherent meaning, reading should dwell upon the multiplicity of meanings contained in the text. In other words, it should not be restricted to the original intended or appropriated meaning. The hermeneutic concern for that meaning which the author or the original reader would have recovered from the text was, by this view, designed to effect a conceptual closure which must itself be overcome. The hermeneutic belief that the text has a pre-given determinate meaning and that the original reader could recover that meaning on the basis of the existing world of shared meanings was thus questioned. With it the idea that texts/words have an univocal meaning in a particular context was also challenged. Third, the

existence of univocal meanings was itself contested. For postmodernists, even utterances and actions are multivocal. It is not as if words acquire different meanings when they are placed in different contexts, rather this multivocality is embedded in them [Laclau 1970:29]. The important thing therefore is to use this multivocality to draw meanings from these words and texts which the author may not even have intended and the original reader may have completely ignored [Derrida 1982: 317].

Thus far I have mentioned the philosophy of reading and interpretation that is derived from the notion of multivocality. Let us now turn to the notion of text that is delineated in it. In this connection, perhaps the most significant postmodern assertion is that texts (being multivocal) are open, ambiguous, and incoherent. Since a coherent unified structure is associated with the presence of an identifiable and often univocal meaning, incoherence and ambiguity are taken as the defining feature of multivocal texts; and insofar as multivocality is a feature of all texts, these are in effect the attributes of life, history, culture, and even social structure. As incoherence and ambiguity are attributes of all texts, postmodernist reading does not try to overcome these features. Instead, it takes cognisance of these features and converts them into positive values that must be actively pursued by the analyst/reader. Reading should, for the postmodernists, try to focus on the ambiguity and incoherence present in the text, perhaps by reflecting on the metaphors in language, hyphenation and common roots of words. Through these and other associated strategies, the reader is expected to loosen the text by allowing other meanings to seep into the text. Thus, postmodernism first postulates ambiguity, incoherence and non-determination as the attribute of texts, and then actively pursues the ideal of ambiguity, incoherence and multivocality in reading and analysis. Together these are taken as enunciations of the denial of the metaphysics of presence and foundationalism of every kind.

The recognition of multivocal meanings and inherent incompleteness of the text provided a decisive break with the post-enlightenment concern for 'totality'. More specifically, it celebrated difference and heterogeneity by placing it everywhere: within history, particular cultures and social contexts. No longer were progress and emancipation seen as the universal or univocal projects of human history. Not only was history seen as the repository of many individual projects, each project itself was seen to have many voices. As Laclau said, we cannot speak of emancipation, we need instead to refer to emancipations or plural projects of emancipation. Similarly, culture could no longer be defined in terms of a single language game or a shared

historical spirit. The accommodation of plural language games within the same space opened up cultures such that differences that had hitherto been pushed outside the boundaries of the national cultural life were now inserted into the mainstream. Multiplicity made cultures more sensitive to the existence of internal others and prompted reflections on issues generated by the coexistence of plurality and heterogeneity.

Postmodernism gave authenticity to the repressed other. Combined with the notion of plural projects of emancipation, it legitimised the struggles of various groups – e.g. women, greens, ethnics, immigrants, blacks, students, etc. In this connection it also pointed to the limitations of defining the self in terms of a single identity. And its own conception of the self as the bearer of multiple identities – of class, caste, gender, ethnicity, region, nation – displaced the homogeneous subject of the enlightenment narratives of emancipation. Seen in this way, the emphasis on difference and plurality provided a theoretical perspective from which both the failure of the Marxist project and the relative success and significance of the other projects of emancipation could be understood.

Plurality, difference and heterogeneity, however, represented only one dimension of postmodernism. As such, the insights generated by these concepts have to be supplemented by reference to the other dimension of postmodernist readings of multivocality: namely, the ambiguity, incoherence and incompleteness of all texts. When the latter is applied to the study of philosophic texts, it suggests both the absence of a coherent meaning in the text and the critical potential of different readings. However, when it is applied to the text of human life, it justifies the absence of coherence, narrativity and continuity, in fact it celebrates schizophrenia and makes it the norm of every day life. In effect thus, it undermines the very possibility of social life and social interaction. Further, the singular emphasis on difference and the accompanying silence about the shared worlds, reduces society to an aggregate of isolated, monad-like individuals. The reluctance of postmodernists to speak of the shared games and meanings also reinforces a picture of a fragmented world in which communication, let alone the possibility of understanding an other, is almost entirely excluded. In contradistinction, hermeneutics had emphasised the shared world of meanings on the assumption that people living in the same historical and cultural world communicate with one another, and that communications requires the existence of such a world of shared meanings. Consequently, to understand the meaning of those expressions/texts through which individuals address and communicate with each other,

they emphasised the 'objective mind' or shared meanings. While stressing this shared dimension of social life, the theorists of hermeneutic understanding were probably aware that there are residual meanings of texts, and that meanings may sometimes elude the addressee. However, they ignored these aspects because shared meanings are a precondition for communication and understanding; they are the basis of social life. Postmodernism, on the other hand, with its eyes on internal difference, undermines the place of communication and understanding in social life. Thus, even as the postmodernist idea of difference creates space within which diversity can be accommodated, the accompanying references to the absence of coherence and narrativity reduce the social to the status of a fiction.

The fragmentation of the social world is within this perspective, compounded by the postmodern belief in the 'ambiguity', 'incoherence' and the 'inherently incomplete' nature of social structures and the 'unstable nature of all relationships'. Ambiguity and incompleteness of the structure are, it argues, "not the result of the empirical impossibility of its specific coherence being fulfilled, but as something which 'works' within the structure from the beginning" [Laclau 1990:28]. Hence, "even as a regulative idea, the coherence of the structure, must be questioned" [Laclau 1990:29]. Although reference to the inherent instability of the social structure was made with a view to emphasising the undetermined nature of the historical process and the existence of plural identities, this idea eventually jeopardised the very notion of a structure. One could no longer speak of patterned regularities and their possible consequences.

Besides questioning the notion of structure, the postmodernist denial of coherence in life and social structure precluded the possibility of offering explanations. Previously, critics of historical determinism had questioned the existence of invariable laws of historical development and pointed to the over-determined nature of historical situations. They argued that various structures – each capable of generating an effect – may in conjunction with each other produce an effect (event) that is neither predetermined nor attributable in advance to the existence of any one dominant structure. Similarly, variables that are individually insignificant, may in association with others yield a result that is completely at variance from our general expectations. Both these arguments pointed to the improbability of predicting with any certainty what might happen. They provided space for human intervention and effect variation. However, in doing so they did not question the existence of a structured pattern of interaction between these multiple

variables, nor did they doubt the ability of a structure to produce a specific effect by itself. What they challenged was the conclusion that the existence and preponderance of a particular structure would necessarily determine the historical outcome.

While the advocates of postmodernism questioned most of these statements, their idea of incoherent and ambiguous structure, challenged the very existence of patterned regularity and structure. Indeed, in their analysis the notion of social structure was displaced by the notion of 'dislocations'. Whether there can ever be a notion of dislocation without a prior understanding and determination of locations, structural regularities and identities, are issues that remained unexamined. Similarly, what would a narrative of dislocations be, remained an enigma.

These questions, apart, the denial of regularity, coherence and determination ruled out the possibility of offering explanations, however, incomplete, partial or limited they might be. To return to our earlier statement, the critics of historical determination and deductive-nomological explanations, dissociated prediction from explanation and argued that even though we cannot predict, we can nevertheless provide post-hoc explanations. For instance, we may not be able to predict where the bullet fired from the revolver will hit the force shield, yet, after the bullet is launched at a particular point, we can retrospectively explain why it landed where it did [Aronson 1984: 64-65]. That is, we can explain its trajectory by methodologically (and temporarily) closing off what in reality is an 'open' system, undetermined and subject to the play of various variables.

Postmodernism objected both to the belief in the existence of a coherent structure and the attempt by the analyst to introduce closure. It considered even the methodologically postulated closure to be a way of 'fixing meanings' and introducing determination. In its enthusiasm for indeterminacy what it perhaps ignored was the fact that every utterance and performance of action entails the introduction of closure. While situations are open-ended, actions seek to give them a determinate end. Human intentions may not always be realised and other individuals may read the situation differently; but individual actions can be conceived and executed only by giving a determinate meaning to a situation. A certain degree of closure is therefore integral to our being and social life. It is neither a myth nor a limiting aspiration.

In sum, the notion of multivocality has two correlates, difference and non-determination. Insofar determination represented essentialism, the postmodernist emphasis on non-determination expressed its anti-essentialist and anti-foundational agenda.

Giving a positive content to this agenda and upholding the norm of non-determination, many of its adherents decried attempts that were aimed at identifying the necessary attributes of an entity and specifying its stable relationship with other entities. To put it differently, many postmodernists translated non-determination to suggest the incoherent and ambiguous nature of the text. Social structures, just like life or history, were in this view incoherent, unstable and ambiguous. This conception of the text, as we observed earlier, fragmented the social world and reduced it to a myth. At the epistemological plane, the denial of univocity, including the claim that words or utterances can have a univocal meaning in a given context, opened the floodgates to relativism.

Thus, the postmodernist equation of anti-essentialism with incoherence and relentless difference created several analytical difficulties. To begin with it excluded the possibility of offering even partial explanations of social phenomenon. Moreover, its denial of the social undermined both understanding and communication in the life world. Consequently, it is necessary to dissociate the postmodernist critique of essentialism from its assertions about the incoherence, ambiguity and incompleteness of all texts and readings. Separating the former from the latter may well leave behind a legacy that can benefit all of social sciences.

STRUCTURE AND ADMINISTRATION OF SALES TAXATION IN INDIA

- An Economic Analysis -
(1995-Second Edition)

by

Mahesh C. Purohit

Professor

National Institute of Public Finance and Policy

New Delhi - 110 067

Price Rs. 450.00 ★ US \$ 60.00 ★

Hard Cover ★ Pages XII + 303 ★ ISBN No. 81-85930-01-5

Contents: Introduction; Fiscal role; Economic effects; Structure of sales taxes. Rate structure, exemptions, taxation of inputs, surcharge and additional sales tax, works contract and leases. Empirical estimates of incidence of sales taxes Rationalising sales tax structure. Weaknesses of the existing structure, short and medium term reforms, an approach towards State-VAT. Inter-State coordination in sales taxes; Administrative organisation: Operation of the tax including evasion and enforcement; Management Information System; Summary and Policy imperatives

Another valuable treatise from the same author on:

**Principles and Practices of Value Added Tax
Lessons for Developing Countries
(1993)**

Price Rs. 250.00 ★ - U.S. \$ 30 ★

Singapore's 'Other' Brain Drain

M G G Pillai

Many middle aged Singaporeans are leaving for greener pastures – not to Australia or Canada but in neighbouring China, Malaysia and Indonesia. A combination of factors, economic and social, have fuelled this movement.

AS Singapore's older, poorer-educated and skilled citizens settle in neighbouring countries, the republic faces a cultural and societal conundrum that questions its long-term viability. The unaccustomed frenetic life, an unwillingness or inability or both to change, the consequential irrelevance in a country which judges worth by economic usefulness, the burgeoning cost of everyday living, force them to leave. They cannot live within their means, especially after their retirement, but because the Singapore dollar is firm, they sell their flats and other assets, cash in their provident fund contributions, to settle in – not Australia, Canada, the US, where immigration is stricter than it once was – but China, Malaysia, Indonesia. The brain drain to the west and Australia of the younger people, on the other hand, has not only slowed but is reversing: there are almost as many westerners on local pay in Singapore than Singaporeans overseas.

Many a middle-aged Singaporean leaves with no desire to return. His assets of a few hundred thousand US dollars – an average Singaporean would have at least that much in his provident fund account in a lifetime of employment – and the proceeds from selling his government-built flat and his other investments can fetch a fortune in local currency and a better standard of living in neighbouring countries or China. Many set up small businesses. Some eventually acquire citizenship. But these are the very people a young society like Singapore can least afford to lose. Why then do they leave? The contrast between difficult living and cheaper conditions elsewhere, combined with the break up of the extended family into a nuclear one, makes it attractive for those caught betwixt fixed income and rising costs. They do not fit into the impersonal life of their progeny. The old often are lodged in old folks homes, with occasional visits from their children if they are lucky, or left to their own devices, if they are not. Besides, the government's stern meritocratic charter regards anyone dependent on its rudimentary welfare system as wastrels, indolents or worse. Even the health system provides free care only after a humiliating admission of indigence. When the late Alex Josey, the biographer of Singapore's former prime minister, Lee Kuan Yew, and an important footnote in the island's modern history, could not afford medical treatment of Parkinson's disease several years ago, a government spokesperson callously said he could have

had it, free, at the third class ward of the General Hospital. Many Singaporeans seek treatment in Malaysia's general hospitals because it is so much cheaper there.

Singaporean leaders worry about these departures. In any society, this group, often ignored, provides both a link with the past and solidity with the present, and pass the cultural baton on to the next generation; besides, it also conditions the present generation from losing its bearings. Japan's cultural roots are enmeshed in its rice farmers, with the government prepared to go into a trade dispute with the US over imports of American rice into the country. They believe, rightly, that Japan's cultural heritage is best preserved by these conservative rice farmers amidst the post-war modernisation. Every Asian society has variants of this theme, which the political overview carefully nurtures. But this becomes difficult in Singapore. Inflation, high salaries, personal and institutional greed reduces even well-to-do pensioners to genteel poverty. Migration for many is a necessity, not an option. The government is unable to reverse this trend quickly enough even if Singapore as a global trading centre is tempered with a conscious invocation of traditional values. This superb Singaporean efficiency, better than any the west can provide, however, is encased in a high, though hectoring, moral Confucian stance which erupt often enough into irrelevant 'East versus West' conflicts when, for instance, it lands on an old-fashioned vandal's Caucasian buttocks. But this ethical code can only be sustained by a reverence for elders, be he Malay, Chinese or Indian and more than lip-service to their presence.

The contradictions in Singaporean society come home to roost with a vengeance. But the signs have been there for more than a decade. The pampering of English-educated Singaporeans and the concomitant decline of the importance of those educated in the other official languages led to another conflict of values which rankles and remains unaddressed. Another is Singapore's mathematical insistence of her Chinese population remaining at 76 per cent, Malays 15 per cent, Indians 6 per cent and the minuscule polygot minorities the rest. They maintain it with fresh migration to compensate the racial balance of those who leave. So, Hong Kong Chinese replace those Singaporean Chinese who left for Australia, Canada the US; professionals from India

replace local Indians who migrate. The Malays did not emigrate in large numbers, and are therefore relatively stable.

But these newcomers cannot upset the political balance, would enhance the republic's prestige as a centre for excellence, provide needed expertise, raise standards of living without contributing – yet, anyway – to her cultural life. The obvious worry, unstated, is Singapore's consequent evolution into a transient society, with money determining if one stayed or not. The high flying Singaporean has become one who, like the typical fund manager, transfers investments and funds at a moment's notice to another haven where fiscal returns are better. When Indonesia invited Singaporeans to buy houses in their islands of Bintan and Batam, within sight of Singapore, at prices so ridiculous, compared to Singapore, a virtual stampede ensued to get them. Singaporeans push house prices in Johore Bahru, which links West Malaysia to the republic through a causeway, to astronomical heights. These all too frequent departures for cheaper, more affordable havens could break asunder Singaporean society. The political costs to Singapore can be even worse.

Concomitant with this is the younger well-trained Singaporean's reluctance to move overseas. The foreign ministry attracts them with fiscal incentives to make the Singaporean diplomat highly paid, with generous overseas allowances and special payments to wives who leave their jobs behind, but the problem remains. Most Asian societies, with working couples, face similar heart-wrenching decisions whenever families have to be uprooted, but is even more severe in Singapore. So, inevitably, it is the elderly, with fewer commitments, who are available for overseas assignments, and who, when they retire, remain there permanently. This reverses the traditional tendency where the young travel overseas for employment to take care of their elderly at home.

Economically, these departures ease the burden on a society where a rapidly aging population depends on a declining pool of working men and women. But for a nation dependent on emigration, an outflow of people in large numbers, as Singapore is, this can only be counterproductive. The economic costs cannot precede the cultural if a society is to take root. But for that inherent Confucian society to take root, the elderly must not only be around to pass these ideals down from grandfather to grandson. That is less of an option among nuclear families. Three decades of modernisation to the exclusion of everything else gave a cataclysmic shock to its social system. Singapore now tries to temper this modernisation with social and cultural grace, but it races against Grandfather Time. Meanwhile, the older Singaporean find solace elsewhere.

Mass Struggle: The Only Option

Pradhan H Prasad

Gandhi had warned as back as in 1934 that the Congress would commit suicide if its attention was solely devoted to legislative work. Swaraj, he had declared, could only come through all-round consciousness of the masses. Why should not a movement to raise mass consciousness be launched in India today when the country is seething with burning issues?

THERE is a set of figures¹ which would indicate that there is evidence of economic growth after the end of direct rule of British in India on August 15, 1947. For the 42-year period from 1950-51 to 1992-93, the annual growth rate of per capita income and agricultural and industrial production, all at constant prices, has been about 1.6, 3 and 6.6 per cent, respectively, whereas population growth has been about 2.1 per cent per year. If, however, we add to this set of growth figures, the statistics related to decline of proportion of poor population between 1956-57 and 1987-88 at an annual rate of about 2 per cent per year,² there seems to be some evidence suggesting growth with social justice. But then if we look at the figures relating to increase in the backlog of unemployment from 5.3 million at the beginning of the Second Five-Year Plan (i.e., in 1955-56) to 25 million in 1992-93, an annual rate of increase of about 4.4 per cent, one wonders whether the whole thing suggests a march towards socialism or a widening panorama of dole culture and dependence paradigm.

The situation gets still more confused if one glances at other facts. Government expenditure has been increasing at a rate of over 8 per cent per annum during the period resulting in bureaucratic expansion and adding to the middle-person culture increasing the broker types, their numbers and their profits. Apart from public loans and taxes, deficit budgeting became an ever increasing source of government expenditure adding to inflation. Prices rose at an annual rate of 6.5 per cent. Inflation is considered the most regressive form of resource raising, an affront to the cause of social justice. In this process the phenomena of black market and black money surfaced in a big way. This in combination with the ever-increasing joblessness promoted lumpen proletarian and petty propertied class ideology which strengthened the fanaticism of race, religion, caste, region, language, ritual, culture, etc. Partly as a survival strategy and partly in order to gain profit for the black money, the activities which acquired expansive character

in this process were thieving, cheating, dacoities, robberies, riots, extortions, kidnapping for ransoms, smuggling, drug peddling, manufacture of spurious goods, flesh trade, etc. Let alone the equity aspect, even the growth syndrome seems to vanish from the Indian scene. This is not all.

CULTURE OF DEPENDENCE

In the process of its development strategy, the government of India designed and attempted to execute a plethora of programmes. Some of them it attempted to implement itself and others through non-government organisations (NGOs). Beneficiary participation was also put as the caveat in some. Many NGOs also acted as agents of others (foreign as well as Indians). Often the NGOs developed their own programmes. Alongside we find growth of subsidy and dole cultures. In all these, one thing was common – that thoughts, other than the people's own thoughts, were heaped on the people. Most of them were accepted by some because they were beneficial and a few were such as some set of people might have even desired as a priority. But as time rolled on, the people by and large began to look upon the government or the NGOs or any other group or organisation for redressal of even their minor grievances which could be sorted out by them as a group on their own. Indians, thus, by and large, got imbued in a culture where they refused to think and act collectively on their own. Even if the group be small or homogeneous, their behaviour remained the same – a dependence paradigm *par excellence*.

Indians had not bargained for it when they supported the Indian National Congress blindly and faithfully either in its struggle against the British imperialism or when it entered into a compromise and strengthened its link with neo-imperialism. They even hailed the development strategy and the parliamentary system adopted by it for the neo-colonial state of India after the middle of the 20th century. Of course, the few skirmishes or protests by trade unions,

organised peasantry and groups from the petty bourgeois and petty propertied classes were nothing more than the stock in trade of the parliamentary system. It seemed that it had won the lasting confidence of the toiling poor who were being deprived of the awareness and understanding of the dynamics of their material conditions of living while neo-imperialism and its class collaborators (i.e., the Indian ruling class) have been busy plotting against them.

Indians for quite some time have been viewing 'progress' in terms of eradication of widespread poverty through massive employment generation and finally obliterating exploitation from their lives.³ The form of government visualised by them to move towards 'progress' was a fully decentralised democracy. Gandhi had said, "My ideal village will contain intelligent human beings. They will not live in dirt and darkness as animals. Men and women will be free and able to hold their own against anyone in the world. There will be neither plague nor cholera nor small pox, no one will be idle, no one will wallow in luxury."⁴ He later on added, "Independence must begin at the bottom. Thus, every village will be a republic or panchayat having full powers."⁵ The panchayat system was so deep-rooted in the Indian psyche that Indian revolutionaries (many among them were aware of the Marxian thesis of 'dictatorship of proletariat') did not underestimate the efficacy of panchayats in Indian situation. Ram Prasad Bismil of Kakori fame wrote his last piece three days before hanging, that is on December 16, 1927, "By the grace of God, I shall be re-born many times and my objective shall be to attain complete freedom in the world, everybody shall have equal right on the gift of nature, so that no one rules over other. Governance by 'panchayats' shall be universal."⁶

British rule was considered as the biggest hurdle in the march towards progress. The struggles and movements which were launched to end the rule of British imperialism and which influenced the course of events since the beginning of 20th century can be broadly classified in two categories. One was by a set of young patriots *par excellence* and martyrs to the cause of freedom, known as Indian revolutionaries. They practised violent revolutionary struggle against British imperialism beginning with the Chapekar brothers' killing of two British officers on June 22, 1897 and ending with the hanging of Bhagat Singh, Sukhdev and Raj Guru on March 23, 1931.

The other set consisted of petty bourgeois groups dominated by professionals. The important among them who significantly influenced the events during the course of

independence movement were the Indian National Congress and the Muslim League.⁷ As the Congress began to acquire a dominant position in negotiating with the British, the Indian bourgeoisie began to acquire a hegemonic role in it. The compradore character of the bourgeoisie was perceived by the Indian revolutionaries as early as in December 1929 in the *Manifesto of Hindustan Socialist Republican Association*.⁸ That is why Bhagat Singh, a few months before hanging, had warned his countrymen that the Congress will ultimately enter into a compromise with British imperialism and betray the Indians' struggle for independence.⁹ This was fully corroborated by subsequent events. Congress finally entered into a compromise with the British imperialism which led to partition of the country in the name of so-called independence and to forging still closer economic links with imperialism. Congress leaders were aware of the fact that federalism was the only answer to communal strife prevailing in the Indian sub-continent,¹⁰ but curiously enough they preferred partition to federalism.¹¹ Further, the Indian Constitution completely ignored federalism, playing into the hands of imperialism and provided for a strong centre in a large country with innumerable variations in terms of religion, caste, race, language, ritual, culture, region, etc. In India's development strategy, foreign aid became the kingpin and it also adhered to the techno-industrial culture which was associated with imperialism (an abiding feature of capitalism)¹² in spite of the warning against it by Gandhi.¹³ While rural development came under the guise of the Indo-US Technical Co-operation Agreement of 1952, the socialist block of nations gave us the cue for initiating some institutions (like public sector undertakings and central planning system) which were used more as show-pieces. The people continued to be duped.

The technological upgradation which got initiated in the process (for example, a switch from coal-based to petrol-based technology)¹⁴ made us increasingly dependent on import of capital and intermediate goods. Since we lacked adequate export potential, foreign debt and debt-servicing began to increase over time. Foreign trade deficit and debt-servicing which was about Rs 2.4 billion in 1951-52 increased to Rs 272.6 billion in 1992-93, an annual increase of about 12 per cent. It was this annual commitment of Rs 203.7 billion to be paid in foreign currency in 1990-91 which brought us to the verge of bankruptcy in the international money market and we were forced to accept loans from IMF and World Bank (agents of imperialism) with harsh conditionalities and stipulations.¹⁵ It was this *diktat* of IMF and World Bank, later christened as the New Economic Policy 1991,

which has compelled India to face the fury of world market forces disregarding its own socio-economic compulsions. Not that prior to mid-1991, the Indian ruling class was sensitive to welfare and aspirations of the masses while pursuing the policy of strengthening the culture of brokerage, subservience and dependency in the name of promoting socialistic pattern of society. Then market forces were not kept so free. But the regulations were hardly conducive to progress. However, the New Economic Policy 1991 has not been imposed as a remedial measure, but has been forced on us so that the stranglehold of imperialism over the country gets further tightened. The commitment to pay in foreign currency on account of trade deficit and foreign debt-servicing has in the two years following the New Economic Policy 1991 increased from 12.1 per cent per annum to 15.6 per cent per year. The foreign debt which was 51 billion dollars as on March 31, 1991 would now be about 100 billion dollars.¹⁶ For the first time since 1947, industrial production registered a decline in 1991-92. There was a further dip in employment in the organised sector of the country. Thus, there seems to be no possibility of the country's march towards progress so long as it faces the full onslaught of market forces at the global scale which are being continuously manipulated by the trading giants of imperialism.

AGAINST IMPERIALISM

The only option left is the revolutionary mass struggle against neo-imperialism and in this process of progress towards growth with social justice, Indians will have to wipe out imperialism from the face of the earth. So long imperialism rules the roost, the colonies or the neo-colonies like India can hardly escape exploitation. In order to achieve this they have to draw lessons from the intimidating ascendancy of imperialism over time and space.

The lessons which are important in this context are those related to revolutionary struggles against imperialism that have taken place in the world. It is also a well accepted tenet that both, the successes and failures of revolutionary struggles add to the knowledge of revolutionary theories and practices. While the revolutions abroad against imperialism provide one set of theories, anti-imperialist struggles in India lead to another set of perceptions and practices. This in fact is the unity of opposites. If one set is ignored and is not integrated with the other, the anti-imperialist revolutionary struggle may suffer or turn counter-productive because of an incorrect strategy. Even if these lessons are fully grasped, there is yet another problem related to the class character of the toiling masses in India who are not the proletariat in the Marxian sense of the term. The low

proportion of non-propertied direct producers (inclusive of landless agricultural labourers and assetless industrial workers) operates as a powerful drag on mass-based revolutionary class struggle. The small propertied class (that is, the agricultural labourers with land, almost the entire working men and women of the organised sectors, the poor and poor-middle peasants, petty traders, many teachers and artisans, etc) has in its fold a large majority of Indians (not less than 70 per cent) who are imbued with the petty bourgeoisie mentality. They would prefer to run the risk of getting caught and punished in doing an illegal act rather than join the class struggle and face savage and atrocious repression by the state power backed by ruthless neo-imperialism. Gandhi's perception of this led him to write in *Young India* on March 20, 1930, that he "urged non-violence not on the highest ground of morality but on lower ground of expedience".

That in face of these, class struggle against the capitalist structure is ranging for over more than two decades, particularly in Andhra Pradesh and Bihar, suggests that all is yet not lost in India. However, the most important question is how to strengthen it, make it a mass-based class struggle against imperialism and its class collaborators. Is there a role in this for the small propertied class who are suffering, are likely to suffer more in the future and are friends or potential friends of the class struggle? Can they be involved in the non-violent mass-based class struggle for progress? Gandhi's perception led him to say to Maurice Frydman in 1939 that if you talk to the villagers "and they begin to speak, you will find that wisdom drops from their lips".¹⁷ Taking a cue from this, if those (from among the petty bourgeois and working classes) who understand the dynamics of the material conditions of living in India, work as a catalyst, they can promote the mass-based revolutionary class struggle against neo-imperialism and its class collaborators.¹⁸ They can do something similar to what Mao did in his revolutionary practice, "from the masses, to the masses".¹⁹ Any struggle which stands for social justice and is against exploitation, if it gathers momentum, will come ultimately in direct confrontation with imperialism.

LESSONS FROM PAST

The Indian revolutionaries, involved in the anti-imperialist struggle on the basis of historical facts available till then, neither overestimated their armed strength nor underestimated the brutalities and repressive power of the British. Probably they wanted to arouse the nation which was in deep slumber. Barindra Ghosh, brother of Shri Aurobindo and a leader of those who actually manufactured the first set of bombs in Bengal, said, "We did not mean or expect to liberate

our country by killing a few Englishmen. We wanted to show our people how to dare and die".²⁰ Twenty years later within six days after the killing of Saunders²¹ the posters which appeared on the walls of the city of Lahore contained the following famous sentence: "Though it may be admitted that no armed revolution can be accomplished with a sprinkling of arms yet they will indeed be enough to wreck vengeance for the repeated national insults which the administration indulges in from time to time".²²

On April 8, 1929, Bhagat Singh and Batukeshwar Datta dropped bombs and leaflets in the central legislative assembly in New Delhi and allowed themselves to be arrested. Bhagat Singh, in the course of his lengthy statement during the trial of the Lahore conspiracy case, had said: "Our sole object was to warn the listless and to wake up the deaf. Many others are thinking just like us. The bombs which were thrown were intentionally so manufactured as to cause insignificant damage, and they were thrown also in such a clear place as to produce the least injury to anybody. Under the apparent calm on the surface of the Indian mind there is a ceaseless terrible seething discontent on the point of bursting into a storm. Our action is merely a danger-signal to those who are rushing ahead thoughtlessly without caring for the serious consequences before them."²³ He also added: "The opponents of revolution mistakenly believe that revolution means violence with arms, weapons and such other means. But revolution is not confined to this process. It may be that these are used as instruments but it should not be forgotten that behind them is the solid strength and spirit of the revolution and that strength is the will, the aspiration of the people to demand and get a change, a revolution in the current economic structure, the shape and form of political government of the nation. Our idea of revolution has never been simply the bloodshed of some individuals. It is to end the present regime of exploitation of man by man and to secure for our nation absolute right of self-determination. That is the ultimate objective of our idea of revolution."²⁴

Ashfaq Ullah also of the Kakori fame, a little before his hanging in 1927, gave a message to his countrymen: "We have played our role on the political stage of our country. Right or wrong all our actions were motivated by the lofty object of securing independence. I know my actions will elicit praise from some quarters and criticism from others, but as a true revolutionary I am indifferent to such remarks. One thing I beg to clarify before I die. It never had been our object to create terror in the country. Our trial has lasted for such a long time but tell me if ever we tried to shoot down an approver or a prosecution witness. That is not in our line.

My only wish is that my countrymen may, irrespective of their religion or creed, unite like a solid bloc to smash the citadel of British rule."²⁵

It is difficult to say but then they might have considered practising non-violent democratic mass movement had they some perception of this which partly they themselves provided in the course of their heroic struggle (and the rest is provided by the historical events since 1931 till today). Mao, who led a very protracted struggle against imperialism, was not favourably disposed towards violent uprisings (that is, putschism). He said: "In its social origin, putschism is a combination of lumpen proletarian and petty bourgeoisie ideology. The methods of correction are as follows: (1) eradicate putschism ideologically; (2) correct putschist behaviour through rules, regulations and policies."²⁶

Recent history also provides some evidence to suggest that even successful violent struggles of peasantry and working class are prone to lead to dictatorial forms of government and concomitant bureaucratic consolidation which operates as a powerful drag on raising of mass consciousness and thereby becomes a drag on social progress in the long run.²⁷ There is also no evidence to suggest that this will not happen in a non-violent democratic movement against imperialism and its class collaborators that

has not yet been practised anywhere. There can be no doubt, however, that mass-based struggle for social justice is the only route which is capable of raising the level of mass consciousness. Gandhi's perception has made him say as back as in 1934, "But the Congress will commit suicide if its attention is solely devoted to legislative work. Swaraj will never come that way. Swaraj can only come through an all-round consciousness of masses."²⁸ That he did not put this perception to practice was responsible for his getting trapped in parliamentary misadventure which finally paved the way for the Congress to enter into compromise with imperialism. But then the perception can hardly be ignored.

But then there are some positive perceptions and also some indirect evidence in favour of non-violent democratic movement. Why should such a movement not be practised in India which is seething with burning issues? For example, one such is the issue of eradication of joblessness which is in sharp contradiction with the present policies of liberalisation and imperialism. This can be one of the many issues for the movement provided the people decide to take it up. The autonomy of gram sabha and gram panchayat may be another issue. There is a possibility that initially different localities will take up different issues. But once this ethos of self-reliance grips the masses, the movement will generate its own

DEVELOPMENT AID TODAY

Editors: Abhijit Dasgupta and Georg Lechner

81-85399-30-1

152 pp Hardcover

Rs 250/US\$ 25

This book provides a scholarly exchange of views on the vexing question of development aid. It brings together the pro- and the anti-views, and the views of those who choose the middle ground. It will be valuable to all those involved with the giving or receiving of aid, in its various forms. It would be a useful addition to libraries concerned with economics, sociology and political science.

Contents: Foreword, Abhijit Dasgupta and Georg Lechner • Development Aid: A Stocktaking, Abhijit Dasgupta and Georg Lechner • German Development Co-operation Today: Some Lessons Learnt in India, Heinrich Dehn • The GTZ Experience in Development Aid Projects in India: A Case Study, V.M. Raghavan • Some Reflections on International Development Aid, R. Sudarshan • Fatal Aid: The Author's View on the Issues of the Book Ten Years Later, Brigitte Eriker • How Do We Translate Development Ideology into Action?, Ann-Lisbet Arn • Aid and Development in Bangladesh: A Critical Review, Hossain Zillur Rahman • Technology Transfer: Some Aspects of the Bangladesh Experience, Jayanta Kumar Ray • Development Aid in Bangladesh With Special Reference to Women-focussed Projects, Meghna Guhathakurta • Development Aid: Experience of the Narmada Project, Ashish Kothari • A Summary of Tödliche Hilfe (Fatal Aid), Abhijit Dasgupta

To order. Please send your order to the publishers, enclosing your cheque for Rs 250/US\$ 25 per copy in favour of **Mosaic Books**. Copies will be sent by registered air-mail (postage free) on receipt of your order.

dynamics. Let those who are at a high level of consciousness and have acquired the understanding of the role of imperialism act as a catalyst in the area of their choice. Undoubtedly this will be a long drawn-out movement in which the people themselves will think and act (aided by catalysts) and move slowly but steadily towards mass consciousness and concomitant progress. Has not Bhagat Singh in his *Draft of Revolutionary Programme* (written in jail in the early months of 1931) said, "The main responsibility of the active groups of revolutionaries lies in reaching the masses so as to activate them."²⁹

Notes

- 1 All figures quoted here are obtained from government of India sources such as documents from Planning Commission, Economic Surveys, Censuses, National Sample Surveys, etc
- 2 Because of methodological differences, some experts suggest it to be a little higher than 2 per cent and some others a little lower.
- 3 Indians, since the aggression of British imperialism on its soil, have been experiencing increasing and widespread poverty caused by unemployment following the destruction of their autonomous 'tributary' culture, often loosely termed as feudal system. Those involved with the mass movements or who organised the masses to fight the British oppression had some perception of what masses imply by 'progress'. It was this situation which prompted Jawaharlal Nehru to say in April 1929, "If we are to eradicate poverty, we must first do away with this widespread unemployment". (*Selected Works of Jawaharlal Nehru*, edited by S Gopal, 1973, Volume 3, p 378) Gandhi also echoed a similar concept when he emphasised, "Whether the British remain or not, it is our duty always to wipe out unemployment, to bridge the gulf between the rich and the poor, to banish communal strife, to exorcise the demon of untouchability, to reform dacoits and save the people from them. If crores of people do not take a living interest in this nation-building work, freedom must remain a dream and unattainable by either non-violence or violence" (*Collected Works of Mahatma Gandhi*, Vol LXXXII, December 17, 1942-July 31, 1944, p 120). Bhagat Singh, when asked in the lower court in June 1929 as to what is meant by 'revolution' made a historic statement on his own behalf and on behalf of Batukeshwar Dutt, "I would say that bloody warfare is not an unavoidable part of revolution because it can permit only personal revenge. Revolution is not the culture of bombs and pistols. By revolution we mean that the existing order based on injustice must be changed" (Hansraj Rahbar, *Bhagat Singh and His Thoughts*, 1990, p 162).

RETHINKING RURAL POVERTY Bangladesh as a Case Study

edited by HOSSAIN ZILLUR RAHAMAN and MAHBUB HOSSAIN

Lacking neither in will nor in initiative, a majority of the rural population in the developing world nevertheless continues to live bleak lives full of deprivation and vulnerabilities. Today, poverty remains the single most important challenge for much of the developing world.

Viewing poverty as a multidimensional reality, this book provides a penetrating look at the most serious of contemporary problems. Taking Bangladesh as a case study, it highlights the many facets of poverty as a state and as a process.

Gandhi's Inclusivism

Sanjib Baruah

Mahatma Gandhi: Nonviolent Power in Action by Dennis Dalton; Columbia University Press, New York, 1993; pp 279 + xii.

IN his book, *Leadership*, the American political scientist and historian James MacGregor Burns describes Mahatma Gandhi as the best modern example of a transforming leader. Unlike transactional leaders, such leaders transform the political imagination and the ethical and moral compass of those around them. In his sensitive, sympathetic and lucid book, Dennis Dalton elaborates the theme of Gandhi as a transforming leader.

Dalton's fine-grained discussion of *swaraj* and *satyagraha* makes the Gandhian concepts very accessible, especially to the western readers. For Dalton, inclusivity is the major theme in Gandhi. *Swaraj*, he notes, was not only about India's independence from the British colonial rule, but also about power over oneself. It is about "liberation from attitudes of political or social separateness that fosters ideologies of xenophobia and exclusivity" (p 6). The road to *swaraj* lies in *satyagraha*, "the power of truth and love". *Satyagraha* encourages reflection not only on the part of those who engage in civil disobedience, but also on the part of those in positions of governmental authority. For instance, before launching programmes of civil disobedience, Gandhi wrote to the colonial officials informing them of his plans, typically addressing the officials as, "Dear Friend". The "please help, we both need it" quality to these pleas (p 106), as Dalton nicely describes them, illustrate how in engaging in *satyagraha*, Gandhi appealed to the shared humanity and morality of his adversaries.

In one of the opinions on the book's jacket, Ainslie T Embree calls Dalton's book "extraordinarily timely for an understanding of the redefinition of Indian nationalism that is taking place at the end of the twentieth century". This otherwise valuable book, however, does not quite keep up with that promise. It fails to do so because Dalton does not quite seriously engage in the tensions between Gandhi's ideas and values, and currents that came to dominate India's nationalist movement. Dalton describes the tension accurately: "One might worship Gandhi from afar as a Mahatma or - as the alternative most Congressmen took - accept his judgments as 'policy' but not as a 'creed' ... [E]ach undermined Gandhi's thought and message for neither could give him support when

the going became rough. At the very end, when it was indeed the roughest, Gandhi stood, tragically alone" (p 34). But Dalton does not tell us why Gandhi, whom the official India regards as the 'father of the nation', stood "tragically alone" at the end. Historians associated with the subaltern studies tradition have paid attention to the tensions among competing themes within India's anti-colonial nationalist movement. Partha Chatterjee, for instance, argues that Gandhi's radical critique of modernity was in conflict with the more limited goals of national independence and the quest for modernisation and progress that came to define the Indian nationalist movement.

Dalton reserves some of his harshest comments to describe *Hindu Swaraj*, the *locus classicus* of Gandhi's critique of modern civilisation. According to Dalton, Gandhi's "notorious blanket condemnation of modern civilisation, ... simplistic categorisation of Indian and western civilisations respectively as 'moral' and 'immoral', 'soul force' versus 'brute force', presented a wholesale indictment of modernity, worse, a polarisation into an attitude of 'us' and 'them' redolent of what Gandhi would later decide as 'violence of the spirit' (p 20). Dalton finds Gandhi's argument "grossly overstated, often misguided, and in some instances ... lapses into pure fantasy" (p 20). Even though he notes that Gandhi never retracted these views, since inclusivism is the 'hallmark' of Gandhi's 'style', Dalton remarks that Gandhi's critique of modern civilisation in *Hind Swaraj* was only the "high water mark of his exclusivist ideology: an uncompromising view of human experience" that "would later prove uncharacteristic of the Mahatma". For Partha Chatterjee and Dipesh Chakravarty, on the other hand, Gandhi's critique of modern civilisation in *Hind Swaraj* animates his politics until the end. There is no evidence to suggest that there was a break between a naive Gandhi and a mature Gandhi on this issue. Dalton should have enlisted this opposing argument in order to be more persuasive. Indeed, the argument explains why, when the political battle against the British colonial rule was almost won, Gandhi was alienated from the Congress leadership. Although the modernisers who came to define India's anti-colonial nationalism may have been

somewhat embarrassed by the anti-modernist stance of Gandhi, there is no evidence that Gandhi himself gave up his critique of modernity.

Dalton's reading of *Hind Swaraj* has implications for his analysis of Gandhian leadership. Dalton analyses the salt march of 1930 and Gandhi's 1947 fast in Calcutta to protest against Hindu-Muslim conflagration as case studies of Gandhian leadership. He discusses the remarkable symbolism of salt and cites Gandhi to the effect that "next to air and water, salt is perhaps the greatest necessity of life". Yet Dalton views Gandhi's decision to focus on salt production mainly as a masterful political stroke. Thus he trivialises Gandhi's thinking on the subject. What "deserves to be underlined", writes Dalton, is "the symbolism of the issue", that "the image appears of an outrageous injustice" (pp 100-01). But why is it only a matter of image? Why was salt 'symbolic' only in the non-constitutive, shallow sense? Couldn't it be argued that the laws governing salt production touched the foundation of the colonial rule in India? Gandhi's attempt to build Indian political capacity by drawing attention to the persistence as well as the memory of pre-capitalist indigenous modes of production of salt, outside the gaze of the modern state and of organised industry, was not just smart politics. Here one meets the radical Gandhi who, unlike modernists of both the left and the right variety, did not consider pre-capitalist formations to be simply a part of the "world we have lost", but unashamedly fought a relentless battle in their defence.

Dalton misreads an essay on Gandhi by Shahid Amin. Amin's essay, 'Gandhi as Mahatma', emphasises how peasant perceptions of Gandhi in Gorakhpur district were independent of the message that the Congress leadership wanted to convey to the peasants. Actions such as looting of shops by the peasants, Amin points out, were often at variance with Gandhian ideas and methods. Amin argues that there were multiple readings of Gandhi. Yet, Dalton cites Amin's essay as an evidence that Gandhi's message "had dug deeply into the popular consciousness" (p 32), precisely a view that Amin challenges.

A comparison of Gandhi with Martin Luther King and Malcolm X adds value to the book. Gandhi's influence on Martin Luther King is well known. But Dalton makes an interesting connection between Gandhi and Malcolm X. Both struggled with 'personal emancipation' and they wrote autobiographies that are about self-examination and inner growth. By contrast, Martin Luther King's autobiographical *Stride Toward Freedom*, "relates in impersonal

tones the success of a method but without any journey of the self" (p 184).

The book concludes on the note that Gandhi's life rested on the "premise of inclusivity, that we are all part of one another and violence retards that realisation" (p 200). In a world full of ethnic and racial conflicts, it is worthwhile to remember Gandhi's ability to transcend difference. But it is unfortunate that Dalton's emphasis on this theme had to be at the expense of obscuring Gandhi's critique of modernity in the colonies. After all, Gandhi and Franz Fanon, the other

insider-critic of mainstream anti-colonial nationalism, had a lot to say about the false hopes of an emancipatory universal modernity coming to the colonies. To confine Gandhi to the theme of inclusivity is to miss his insights on what ails modern civilisation especially in the capitalist periphery today. If the Gandhian critique of modern civilisation was sometimes 'pure fantasy', as Dalton puts it, that did not bother Gandhi. He relentlessly pursued his utopia, even if it meant that he had to stand 'tragically alone' at the end.

Russia to make concerted efforts to renew her hegemony over central Asia.

The appendices contain two chapters written in the 60s and the author's justification for including them here for their alleged relevance and his desire to "suit the present context" is, to say the least, puzzling, both the relevance and the context remain irritatingly elusive. The bibliography is hailed by the author as "the index of my debt to intellectual property" though the reader is warned against equating the readings contained in the list as a true reflection of the "measure of the range of my readings on central Asia, China and Russia" which presumably, is immeasurably larger.

If the reader hopes to discover the purpose of the volume, the questions it seeks to address and then implications for policy, this volume will come as a disappointment because none of these concerns exist. The book is an incoherent rambling quasi-historical account serving no recognisable purpose. Its conclusions – contained on the last page – provide some idea of the kind of intellectual demands it makes on the reader. "As in 1838, when the 'game' started, the question now seems to be who will have mastery over central Asia? Although the epoch of domination and mastery of one nation over another seems to have ended, its manifestations are not quite so" (p 92). It need hardly be said that this banal conclusion does not require a volume, a newspaper article induced through a gullible editor would have sufficed.

Essentially a colony of Tsarist Russia, central Asia was traditionally a source of raw materials for the factories of central Russia prior to the October Revolution. The region was predominantly agricultural, technically backward and industry was confined to primary processing of agricultural produce. There is some substance to the erstwhile Soviet claim that the face of central Asia was substantially altered during Soviet rule. This is because industrialisation came to central Asia only during the early part of the 20th century.

The central Asian capitals of Tashkent, Frunze, Ashkhabad and Dushanbe have become major centres of diversified industries including mechanical engineering, light and food industry, manufacturing machine tool equipment, instrument making and production of a variety of consumer goods. The region is a remarkable combination of traditional central Asian and Slavic culture and is today an integral part of the process of renewal that is taking place all over the CIS.

In the changed configuration of circumstances today, there is a serious and urgent need to study the evolution of the newly independent countries of central Asia

Managing India's Central Asian Policy

Ramnath Narayanswamy

China, Russia and Central Asia by Ram Rahul: Vikas Publishing House, New Delhi, 1995, pp x+128, Rs 195.

THE blurb on the back cover of this tantalisingly slim volume describes the author as "the foremost scholar on Central Asia" who completed "his entire formal and research education in Delhi" and "also studied in the United States" and eventually "retired from Jawaharlal Nehru University as Professor of Central Asian Studies". For some reason, the discipline of the learned professor is not mentioned; it is therefore not clear whether the author is a historian, political scientist, economist or sociologist. The blurb on the front cover on the other hand describes the volume as a "study of the positions of China and Russia in Central Asia up to 1991 when Russia withdrew from there". Such distinguished credentials about a region which has traditionally been poorly understood by the outside world encourage the reader to pick up the book with the legitimate expectation of gaining insights into the developments that have caused a complete transformation of the political and economic landscape of this strategic region in the wake of the demise of the erstwhile Soviet Union in December 1991.

Such expectations are however soon belied: the book comes as a rude shock and disappointment and the end of the exercise causes one to wonder why Indian publishers have taken it upon themselves to punish Indian readers with such fare or whether there is a more prosaic explanation for this dismal state of affairs which perhaps lies in the fact that area specialists have simply run out of ideas. The author's introductory remarks may serve as an illustration. The two-page preface labours to emphasise the fact that politically, geographically and historically central Asia has always been a vital part of Asia.

This awesome discovery is followed by the information that Buddhism, Christianity

and Islam "spread from Central Asia to East Asia". Further, "it was from Central Asia that science travelled to West Asia and Europe". By this time, the reader would have realised that the little history he had learnt at school was not only woefully inadequate, but discreetly misleading as well. The Mongols (and the Turks though the latter were not quite able to repeat the performance of the former) later united central Asia under one sovereignty but while China escaped their conquest (Timur the Lame died in the frontier town of Otrar while he was on his way to conquer China), Babar of Osh (Ferghana) was able to conquer India and establish an empire. Subsequently however, due to 'strong neighbours' central Asia was unable to expand outwards.

Today, China and Russia – the legend continues – "have possessed central Asia by dividing it equally among themselves by China appropriating its eastern half (Tibet and Xinjiang) and Russia appropriating its western half (Kazakhstan, Kirghizia, Uzbekistan, Tajikistan and Turkmenia)". In 1991, Russia is supposed to "have lost its position in central Asia", while China "still holds on to it". When stated in such bald terms, this is simply not true. It would be more correct to say that Russia voluntarily relinquished its hold over central Asia with the demise of the Soviet Union (I say voluntarily because in 1992, it was fashionable in Russia to view the central Asian economies as being an undue burden on the Russian economy), but subsequent events (including the war in Tajikistan, the fate of ethnic Russians living outside Russia, the failure of the west to live up to Russian expectations of massive infusions of aid and the desire to protect herself from ethnonationalist threats from her southern borders), have caused

including Kazakhstan, Uzbekistan, Turkmenia, Tajikistan and Kirghizia. This is principally though not exclusively because the region is of tremendous strategic importance to India. It is widely known, for example, that Pakistan has been negotiating for the creation of a common economic space in central Asia by creating a corridor through Iran and Turkey though its efforts in this direction have met with little success. The Chinese on the other hand have been making concerted efforts to build their ties with Kazakhstan by helping the latter to build roads that can access central Asia from China. From a strategic point of view, India has to gear itself to meet these challenges; the more secular countries of Kazakhstan and Uzbekistan will have to be actively wooed and this must be followed by bilateral programmes of technical and managerial co-operation.

Secondly, the historical ties between India and central Asia have to be reconstituted along durable strategies of economic and business co-operation. The central Asian countries are enormously rich in a wide variety of mineral resources. Trade credits extended by the government of India to these countries have been paltry sums exceeding no more than a couple of

million dollars. There is a strong case to increase trade credits to the region and this must be complemented by efforts of the ministry of external affairs to secure favourable conditions for Indian businessmen who wish to enter these markets.

Thirdly, the problems of payments and transportation, the former caused by the primitive nature of the financial system and constant currency depreciation and the latter caused by the fact that the entire region is landlocked. The Indian government has been making efforts to secure sea access through Iranian ports as a short-term solution to the problem but clearly the long-term solution lies in building a railway network from Mashad in Iran to Serakhs in Turkmenia.

The ministry of external affairs should – if it has already not begun the process and there are indications that it has – begin to treat the region on a priority basis, seek to understand the factors that promote and militate change in the region, explore ways and means of overcoming problems stemming from poor infrastructure and communication and initiate research studies by specialists who must be called upon to suggest viable alternate policies that could strengthen trade ties between the two regions.

When one comes across a volume on central Asia published in 1995 (the reviewer actually received the book in December 1994), one would imagine that the work would focus attention on some of these issues, the resolution of which is clearly vital to the process of readjustment that is taking place both in Indian foreign policy as well as in the newly independent states of central Asia. The reader is also entitled to expect a discussion of the consequences of the collapse of the Soviet Union in central Asia, the unique nature of the central Asian economy and polity when compared to other regions in the CIS, the problems surrounding the transition to markets in a region marked by strong collectivist historical traditions, the danger of marginalisation that these countries underwent through 1992-93, the civil war in Tajikistan that caused Russia to renew its interest in central Asia to protect herself from fundamentalist threats across her borders and the efforts of the central Asian countries to balance their national interests on the one hand against revivalist tendencies emerging in Russia (which have grown particularly strong in 1994) on the other.

Unfortunately, the volume under review fails to discuss any of the current issues that confront the region.

Reform of
DOMESTIC TRADE TAXES IN INDIA
 Issues and Options
 by
 A Study Team of the
National Institute of Public Finance & Policy
 New Delhi

1994 * pp xxviii + 145 * Rs. 250 * US \$ 30 * 21 x 27 cms * ISBN 81-900518-0-6

This is a study undertaken by a research team of the NIPFP at the instance of the Ministry of Finance, Government of India to design a suitable system of value added tax for the country.

The study addresses the task by first reviewing the existing system of domestic trade taxes in order to identify its glaring deficiencies and problems. Keeping in view the objectives and the parameters, the study avers that a destination based consumption-type Value Added Tax (VAT) would provide effective remedy for most of the ills of the present system. After briefly describing the principal forms and characteristics of VAT and their mode of computation, it spells out the options in the Indian context and suggests a design of a system of value added tax for India on which there could be broad agreement. Finally, the study provides an idea of the revenue implications and economic impact of the proposed reform alongwith legal, administrative and institutional requirements.

Beyond 'Surpluses'

Food Security in Changing Context

V M Rao

The present comfortable foodgrain situation should induce some hard thinking on the prevailing food security system rather than an attitude of complacency.

The recent trends in agricultural production and the ongoing policy reforms for liberalisation of the economy and reduction in government deficits are the kind of changes which offer considerable scope for improvements in the food security system. It would be easier to implement such improvements when the food situation is comfortable.

Further, success in reaching food to the poor depends not merely on improvements in the food security system but even more critically on the thrust of the broader development policies affecting agriculture and the rural poor. Here again, years of good foodgrain availability tend to be favourable for implementation of development policies and for focusing their benefits on the rural poor.

Thus the present phase in our economy and agriculture is indeed an appropriate time to give serious thought to the past performance, present status and the priorities for the future directions of change in the food security system.

THE problems of food security hardly attract much attention when, as it is true at the moment, the policy-maker's main concern is to cope with large and mounting stocks of foodgrains which are now literally spilling over on to roads and other open spaces. The stocks on hand are reported to be around 30 million tonnes and it is expected that the kharif procurement would bring in another 10 to 12 million tonnes. Meanwhile, with the narrowing of the gap between the issue price and the market price, the PDS offtake as a proportion of allotments has been going down and is currently reported to be less than 40 per cent. For the last more than a year, the Food Corporation of India has been resorting to open market sales to bring down its holding.

We should know from past experience that the pendulum could easily swing to the other extreme if there are a couple of bad seasons with markets turning panicky and trade going on a speculative spree. Barely two years back, around the middle of 1992, the country had to run in desperation from pillar to post to import a modest quantum of wheat in a season with bumper wheat production owing to, reportedly, withholding of produce by the farmers in expectation of higher prices in the later part of the season. There are, however, two even weightier reasons why the present comfortable foodgrain situation should induce some hard thinking on the prevailing food security system rather than an attitude of complacency. First, the food security system, like any other system, has to continually adjust to changes in the economy to remain effective and useful. The recent trends in agricultural production and the ongoing policy reforms for liberalisation of the economy and reduction in government deficits are the kind of changes which offer

considerable scope for improvements in the food security system. It would be easy to implement such improvements when the food situation is comfortable. Second, the success in reaching food to the poor depends not merely on improvements in the food security system but even more critically on the thrust of the broader development policies affecting agriculture and the rural poor. Here, again, it has been the Indian experience that years of good foodgrain availability tend to be favourable for implementation of development policies and for focusing their benefits on the rural poor. If our luck with monsoon holds for some more years, the situation is likely to be very congenial for major systemic changes in food security which until very recently were considered impractical, and even risky, to implement. Thus, the present phase in our economy and agriculture would indeed be an appropriate time to give some serious thought to the past performance, present status and the priorities for the future directions of change in the food security system. Our endeavour in this paper is to present a rapid and stylised review along with a brief discussion of the reforms needed in the system.

FOOD SECURITY: A RETROSPECT

The mid-60s provide a convenient marker to distinguish the earlier phase of policies and measures designed primarily to cope with localised situations of scarcity from the latter phase characterised by a distinct long-term strategy for evolving policies and structures for the regulations, management and development of the country's food economy. It is not suggested that the policies of the latter phase suddenly emerged in the mid-60s, but an economic historian is likely to discover that the traumatic food crisis of that period along with fears about the political

repercussions of large and persistent dependence on imports did bring about a radical change in the perception at the highest level of policy-making about the importance of having a countrywide system of food security based on domestic capabilities to increase production. It is necessary to remember that in the situation which prevailed during the mid-60s there was ample justification to emphasise the two principal objectives, viz, food self-sufficiency and coverage of the entire population in the public distribution system whose appropriateness is now being questioned as being out of tune with the changing economic scene and policy regime.

A detailed account of changes in the food security system in the post-independence period would need wading through a tiresome lot of contentious statistics. Our intention here is only to bring out the direction and the characteristic features of these changes with a view to indicating how the system evolved from a modest beginning to become a countrywide network for acquiring, holding and distributing foodgrains. For this purpose, we use a typology which focuses on the essentials of the system without going into quantitative details. Famines and droughts causing acute scarcity conditions and the measures taken by the government to help the victims could be regarded as the typical way in which the food security system begins to take shape in a poor country. The measures remain in the nature of fire-fighting operation concerned only with putting out the flames and providing a modest measure of temporary relief to the affected population; such an operation, by itself, would not look into the causes behind the flames or the lasting solution to the recurring distress. The Indian history contains numerous accounts of this embryonic form of food security

system and also its benefits and limitations [Bhatia 1967].

Prolonged periods of economic stress and disruption like wars give rise to a form of food security system which is still concerned primarily with management of scarce food supplies but which finds it necessary to use a more organised and institutionalised approach including drastic measures to suspend the normal activities of markets and trade. This form existed in India for long years in the shape of statutory rationing in selected urban areas and continues to be present even today in a few urban centres.

A developing economy needs a food security system looking much beyond management of scarce supplies and critical situations. India took a quantum leap in this direction in the mid-60s [Tyagi 1990]. The setting up of Food Corporation of India and Agricultural Prices Commission (now Commission for Agricultural Costs and Prices) in 1965 marked the beginning of this phase. The key components of this system were institutionalised arrangements and procedures for procurement, stocking and distribution of foodgrains. What is more important to note is that the food security system evolved as an integral part of a development strategy which brought about a striking technological change in selected food crops, provided effective price and market support to farmers and deployed a wide range of measures to generate employment and income for the rural poor with a view to improving their level of well-being including better physical and economic access to foodgrains.

It is useful to distinguish two sub-periods in the post-1965 phase [Bhatia 1994a]. Up to about the late 70s the emphasis remained on the management tasks, procurement with an element of compulsion, augmenting domestic supplies through imports, zoning and restrictions on movement and trade, etc. However, there was a marked change in the food situation in the later years, particularly during the 80s and the early 90s. The net availability of foodgrains which had increased from 74 million tonnes in 1968 to 99 million tonnes in 1977 witnessed a rapid rise in later years reaching 158 million tonnes in 1991 [Government of India 1994]. In 1968, 10 million tonnes of foodgrains were distributed by the food security system. Net imports were 5.7 million tonnes as against 6.8 million tonnes of domestically procured grains. The position in 1991 was strikingly different. The PDS distributed 20.6 million tonnes in that year and procurement was 19.6 million tonnes. More telling, instead of import, there was a net export of 6 lakh tonnes of foodgrains in 1991. The restrictions on farmers and trade have by then been drastically reduced, exports of foodgrains were not only permitted but also encouraged and PDS received enough and more of

foodgrains from purchases by the public agencies at *minimum support prices* which leave the farmer free to choose the place, time and agency for selling his produce. On the whole, considering the recent trends, it would be reasonable to say that the food security system has brought about a visible change in the economy and its perspective on food. From a situation where the policies remained preoccupied with management of scarce supplies, the economy has now seems to have reached a stage where the foodgrain sector could provide a powerful stimulus to overall growth and development.

This would, however, need major changes in the policies relating to the foodgrains sector. The reforms now being implemented to liberalise the economy including agriculture and the prospects of a technological change in agriculture far more broad-based than the green revolution of the 70s are likely to mark a new phase of agricultural development in India [Rao 1994]. Simultaneously, there are also signs of slowing down in the growth in wheat and rice. More important, the growth in these crops may be on the verge of encountering serious sustainability barriers [Malik 1993]. Such periods of change over in the phase of development are often characterised by persistent stresses and disruptions indicating that the components in the system are out of line with each other and with what they ought to be in the new phase. Let us take a quick look at the distress signals being sent out by the food security system.

SOME BIASES AND WEAKNESSES

The initial thrust and foundation for the later evolution of the food security system were provided by the green revolution in wheat and rice. The disconcerting feature of the system is that, even after nearly three decades, it still remains almost exclusively dependent on these two crops. This has been the source of many weaknesses and distortions. The price support policy for rice and wheat which nurtured the green revolution and promoted its spread is now in need of major revision. The policy has had the effect of prompting the farmer to bring his produce to the public agency almost immediately after harvest. As a result, procurement becomes a gigantic operation to be rushed through within a few weeks leaving little time for essential procedures like grading and checking the produce for its quality and condition. More important, given the anxiety of the government about adequate supply of rice and wheat and the increasing reliance of procurement on purchases at minimum support prices, it is inevitable that pressures cumulate for progressive increase in minimum support prices and, as a consequence, price policy, instead of limiting itself to preventing crash in market prices, may begin to operate as

a factor causing rise in them [Rao 1993]. At the same time, the Commission for Agricultural Costs and Prices has been repeatedly pointing out in its reports instances of price support mechanism remaining inactive in backward areas which do not contribute much to procurement [Government of India].

Another major point of criticism with the food security system is its highly centralised and bureaucratised mode of operation. The very name of Food Corporation of India has become a red rag to some critics. A little reflection would show that only a FCI-like organisation would be able to operate a food security system based exclusively on rice and wheat. The surpluses of these crops and, hence, their procurement are concentrated in a few states and, given the minimum support prices which remain fixed for a crop year, the farmers take the first opportunity to deliver their produce when harvesting starts except when a substantial rise in the price of grain is expected in the latter part of the season. The quantities of grains thus mobilised have to be allocated to areas all over the country maintaining a steady flow of monthly instalments of grains supplied at a subsidised price. Obviously, this has to be a command operation as the normal trade channels working for profit may not find the task sufficiently attractive to undertake [Dantwala 1993]. Researchers have shown that, performance-wise, FCI compares poorly with private trade [Tyagi 1990]. Such comparisons are a little unfair to FCI as it is doubtful whether the Corporation has sufficient measure of autonomy to function like a business organisation. In our view, the persistent weaknesses observed in FCI operations are a clear symptom of overcentralisation. While efforts to tune up the personnel and working of the Corporation need to be undertaken, the more fundamental task is to reorganise the food security system itself on a decentralised basis. In the event of such a reorganisation, FCI, with its specialised experience and expertise, would be in a position to play a major supporting role to help the decentralised food security system to become operational. Hence, as we see it, the problem is one of making effective use of the capabilities of FCI in the changing context.

A third area where the food security system is receiving very low marks, particularly from the academics, is the benefits it provides to the poor. There is a consensus among the observers that the food security system has been able to eliminate famines and, also, bring a substantial measure of relief to the poor during years of acute scarcity. Particularly heartening has been the performance of the system during the recent major droughts [Acharya 1989; Ahluwalia 1991]. The latest available NSS data (1986-87) also show that the indicators of extent of benefits received by the poor from PDS are by no

means low enough to be dismissed as insignificant. According to a recent analysis, out of 141 million poor persons, who reported purchase of rice, 58 million (i.e., a little over 40 per cent) are estimated to have obtained the whole or part of their purchases from the PDS. The corresponding estimates for wheat are 75 million and 22.7 million [Jharwal 1993].

However, assessed against the norm of meeting the full or, at least, the major part of requirements of poor, the achievements of PDS could hardly be regarded as satisfactory. Jharwal's analysis shows that PDS accounted for only 17.5 per cent of rice consumption and 11.8 per cent of wheat consumption of the poor. Tyagi finds that the coverage of poor by PDS tends to be very low precisely in states like Orissa and Madhya Pradesh which are backward and, in terms of per capita income, are much below the national average [Tyagi 1990]. The food security system could also be faulted for pursuing a price policy which goes against the interests of the poor. It has been pointed out by Dantwala and many others that procurement has the effect of raising the market price of rice/wheat above the level which would have prevailed in the absence of procurement [Radhakrishna 1994]. Obviously, this would impose a heavy and regressive burden on the poor who, though intended to be the main beneficiaries of the food security system, have to depend on the market for a major part of their foodgrain requirements. Incidentally, Radhakrishna makes the telling point that during the recent inflationary phase which witnessed a much faster rise in foodgrain prices, particularly coarse cereals, the allocations of foodgrains for the anti-poverty programmes had actually declined!

Lest an impression is created that all that the poor need is increased allocation of foodgrains, it needs to be mentioned that the situation is much more difficult and complicated. A poor person who is hungry could be reached by 'food-for-work' type of programmes which provide foodgrains along with the necessary purchasing power. However, economists find that this safety net may not protect the poor who are not hungry but suffer from serious malnutrition. Once there is enough to satisfy hunger, the poor seem to give diminishing priority to foodgrains. It has been noticed that the proportion of total expenditure spent on foodgrains begins to decrease while the household is still below the poverty line [Rao 1984]. Interestingly, a recent multi-country study based on village and household level investigations comes to the conclusion that "increased income and food availability contribute to a quick solution of the hunger problem but not of the chronic problem of children's malnutrition, which results from a complex interaction of disease and lack

of food" [IFPRI 1994]. Considering the extent of prevailing poverty and its correlates of hunger and malnutrition, it is usual to refer to the present large stocks of foodgrains as "surpluses" not indicative of genuine adequacy of foodgrains. The implication is that the economy is still far from the point of overcoming the food problem [Bhalla 1994b].

A balanced view needs to be taken of the two contrasting pictures presented by the food security system - substantial achievements in building up a development-oriented system as compared to the past policies and programmes, at the same time, failure to adopt policies capable of leading the economy from scarcity to genuine adequacy of foodgrains for the poorer strata. To make sense of this apparent paradox, it is necessary to consider the circumstances shaping the response of the policy-maker to the food crisis. The grave situation during the 60s caused by the food crisis needed a mixed strategy consisting of short-term measures for relief and quick increases in production and equally important, long-term structural adjustment for more growth and equity to remove the roots of the crisis. The short-term tasks formed the relatively easier part of the challenge as during times of crisis technocratic-cum-bureaucratic approaches often bring dramatic results and find wide, even enthusiastic, acceptance among people. On the other hand, the long-term adjustments are difficult to implement, particularly in slow-growing democracies. The elites at the helm in the poor countries, who have to bear the burden of long-term adjustments, do their best to evade the pain of adjustment by thinking up an amazing array of stratagems and slogans. In the case of India, the measures for relief and quick increase in production were so successful that the policy-maker could easily convince himself that the long-term adjustments are best talked about but left to the long run! As a result, while the economy has moved from scarcity to 'surpluses', the vulnerability of the economy on the food front persists and the proneness to panic lying just beneath the claims about food self-sufficiency continues to pop up its head whenever there is even a hint of an approaching scarcity.

Looking ahead, there are signs of continuing build up of pressure on the policy-maker to strengthen and streamline the food security system. The reforms for liberalisation now gathering momentum have already brought in their wake removal of restrictions on movement and trade and freeing of foodgrain markets. It is difficult to see the continuation of the present price policy for much longer without major changes. Also, a suggestive sign of changing times is the acknowledgement at the highest level of the need to reduce food subsidies, to improve the efficiency of foodgrain

operations and to focus the PDS on well-defined target groups [Bhagwati 1994]. Thus, there are fairly clear indications of the direction in which the policy-maker would be under growing pressure to move.

It is also possible to see some factors on the positive side which would be favourable for implementing the changes needed in the food security system. Public investments in backward states to improve agriculture and rural infrastructure would now be getting much larger plan allocations. Equally likely is greater attention to new technologies for rainfed agriculture owing to the awareness that these have been neglected in the past. As a recent study has observed "Central Government's concern for speedy achievement of self-sufficiency in foodgrain manifested itself in biased allocation of scientists, research facilities and financial support for irrigated grain crops. Prolonging of this approach and continued emphasis on irrigated areas and irrigated crops have created some serious distortions and disparities in different areas of the country. It is reasonable to believe that if at the margin more funds were allocated for research on unirrigated crops, it would have perhaps resulted in higher marginal benefit (and) helped minimise the handicap of the rainfed areas" [Johi 1994]. Along with higher public investment and improved research and infrastructure for rainfed crops and areas, the central government is also contemplating making Jawahar Rojgar Yojana (JRY) a panchayat-based programme with considerable expansion in its scale [Government of India 1991]. Substantial agricultural growth in rainfed areas and increase in the incomes of the poor in these areas owing to higher growth and expanded JRY would be very congenial to policies to bring about progressive decentralisation and targeting in the food security system. Given this combination of favourable circumstances, there is a good chance that the situation of "surpluses" in foodgrains stretching over some years might trigger major changes in the food security system. It may be recalled here that large foodgrain stocks and accumulating foreign exchange reserves are often mentioned while making out the case for bold economic reforms ranging from reduction in fertiliser subsidy to convertibility of rupee!

REVAMPING FOOD SECURITY: OPTIMISTIC SCENARIO

In view of the serious economywide repercussions of a breakdown in food security, revamping food security system would need a complicated exercise providing for the necessary safeguards. What is feasible within the limits of a broad review is to indicate how the system would look like after it gets adjusted to a liberalised economy having good growth and broad-based

agricultural development. It is superfluous to say that this would give us an optimistic scenario in which the trends would progressively lighten the burden which the food security system bears. As we are already familiar with the variants of the system necessitated by recurring food crises, it would seem more to the point to look for a model appropriate to an era of adequate availability of food through broad-based growth in production.

In such a model, panchayats and other local-level participatory organisations entrusted with the task of implementing diverse development schemes for their areas by mobilising people would be the natural choice as an apparatus selected for reaching food to the poor. This apparatus would identify the poor, monitor their conditions and implement programmes to meet their employment and food needs. It would be far more economical and effective than the present centralised approach in focusing food security assistance on groups which deserve such assistance. It would obviate the need for universal PDS, help in gathering dispersed small surpluses missed by the present procurement network and broad-base the food security system by adding local staples to the national staples of rice and wheat. It must be mentioned that this grass roots level tier of the food security system would not emerge overnight but, hopefully, it would gradually gather strength and cover more areas along with the spread of panchayati raj and decentralised planning.

The next tier in the food security system would be located at the state level forming a part of the state's development planning and policies. The prominent functions to be covered at the state level would include those connected with agricultural growth like investments, adaptive research, extension and infrastructural reforms and improvements. The planning and financing of special programmes for backward areas and target groups including provision of subsidised food would also be located at this level. In addition, this tier would implement the price policy formulated at the national level and hold operational stocks of foodgrains in dispersed locations to ensure intra-year stability of prices and to reach foodgrains to areas in which the normal trade channels are weak and sluggish. The long-term objective would be to strengthen and extend these channels so that the areas needing regular intervention and help by public agencies could be progressively reduced.

Before proceeding further, a word may be added about the scope for decentralising the food security system implied in the scenario sketched so far. Price support operations, moderation of intra-year fluctuations in prices, reaching food to areas remaining out of mainstream market economy and strengthening the economic access to food

of genuinely needy groups by selective and tight targeting could all be located at the state and lower tiers. Since the tiers in the food security system would be supporting and complementing each other, decentralisation would mean that the centre would be able to concentrate its attention of functions which need a national level perspective and authority for their effective performance. Formulation of price policy, maintenance of buffer stocks to even out inter-year fluctuations and effective use of opportunities for growth and diversification offered by the recent GATT agreement are areas where the centre would have to play the major role. It would also be the responsibility of the centre to evolve the strategic framework for agricultural development capable of guiding, supporting and co-ordinating the state level policies and programmes. It has been a frequent point of criticism with the present food security system that it has led to neglect by the centre of its long-term functions because of its preoccupation with routine task which could be left to the lower tiers. Revamping food security to adjust to the changing context would make it possible for the centre to direct its attention again to areas which ought to be of its prime concern.

While a few broad strokes are enough to bring out the scenario, the far more difficult task is to spell out the policies which would be of help in making the transition from the

present to the new system. The success of the new system would depend on the local-level tier which, obviously, would need considerable time and experimentation to develop. What could be implemented relatively quickly is the transfer of functions to the state-level to reduce the excessive centralisation of the system and to limit the interventions of the centre so as to provide enough room for normal market processes to guide production and trade in food. However, interventions would have to be there to ensure that markets serve and not command and that they help change rather than hinder it through excessive volatility.

A careful review would have to be made of the present price policy. While ensuring a reasonable minimum price to the producer would be a legitimate intervention, raising the administered price to "remunerative" levels could be a costly exercise which would benefit in the end neither the producer nor the consumer but only the trader [Rao 1993]. It also needs to be pointed out that even after nearly three decades of price policy effective support has been given so far only to rice and wheat and that too in the states which are the main sources of procurement [Tyagi 1990]. The price policy would have to be reoriented to serve the objective of broad-based growth, diversification and increased export-orientation of agriculture. While the farm lobbies are often blamed for the present

state of price policy, it is our impression that there are by now enough alert sections among the farmers who would favour a less populist and more rational approach to administered prices. However, politicians competing for votes by bidding up minimum support prices could be a formidable hurdle in the way of having a price policy appropriate to the emerging situation.

Another aspect in need of a critical review is the role of the public agencies set up for supporting and stabilising agricultural prices. In the new setting, they would need considerable skill and business acumen as they would have to compete with other market operators on equal terms. Many of them are chronic loss-makers despite special privileges and advantages conferred on them. It would be best to begin by granting them a measure of autonomy along with the responsibility to function as a business organisation. It needs to be mentioned that these agencies have had many occasions in the past to undertake commercial operations [Acharya 1994]. It would be reasonable to hope that, freed of interference, they would be able to discipline the markets much better than now.

With the latest round of agreement among the GATT nations to progressively reduce the barriers to international trade, the food security system could benefit from increased access to international markets through imports of competitive prices and promotion of exports in which the country has a comparative advantage. However, liberalisation of international trade would have to be done in measured steps along with continuing monitoring of world commodity markets which are subject to numerous distortions and a careful assessment of the benefits to the country from the policy of removing trade restrictions [Nayyar 1994]. This is particularly true of the immediate years ahead though in the long run orderly expansion of international trade would make it possible for the country to use trade opportunities to reduce costs and increase effectiveness of the food security system.

CONCLUSION

In the evolution of food security system in India, the transition from scarcity to 'surpluses' marks the end of an important phase signifying the crossing by the country of the Malthusian hurdle of widening gap between the food supplies and the needs of a growing population. The strategy and policies which helped the country in overcoming this hurdle would need substantive changes for the next phase of moving forward from 'surpluses' to genuine adequacy of food. The main lesson to learn is that the situation is now comfortable enough to allow markets to take over the functions which the government performs at greater cost and with much less effectiveness. At the same time, the states

would have to play a more active role by relieving the centre of the responsibility for the day-to-day routine chores. Further, an environment would have to be created in which the local-level participatory organisations would grow, spread and acquire capacity for delivering a wide range of development services to the rural people including implementation of schemes for food security for selected groups. Far from becoming redundant, the public agencies would remain an important component in the system though their interventions would have to be sophisticated enough to keep the market operators on their toes without hindering the legitimate functions of this group.

Looking back on the period since the mid-60s, it would be reasonable to hope that the transition of the food security system beyond 'surpluses' could be relatively fast and smooth provided the momentum gained in the course of achieving 'surpluses' is effectively harnessed for revamping the system in the years to come. While it would be unwise to be complacent about the future, disregarding the achievements so far would hardly be the right perspective for formulating the next phase in strategy and policies. The experiences gained so far in achieving breakthrough in agricultural production – successes as well as failures – would be a relevant input in assessing the future potentialities and opportunities. Equally relevant would be the feedback from the field that, while improved economic access to food is essential for helping the poor, steady increase in their nutritional status would occur only when a substantial rise takes place in their level of living comprising many major dimensions besides access to food. The broader implication for future is that an effective food security system would need not only increase in food production and its equitable distribution but also achievement of these improvements through a development process in which all areas, groups and sectors participate. In a word, moving from 'surpluses' to adequacy of food would need a whole new style of development rather than only so many more tons of foodgrains.

[This paper is based on the author's L. S. Venkataramanan Memorial Lecture given at Institute for Social and Economic Change, Bangalore, in December 1994. Thanks are due to the Institute and P. V. Shenoi, Director, ISEC, for the opportunity given to me to present the paper and to the participants for a useful discussion on the issues raised in the paper.]

Colonial Ethnography of the Kandha

'White Man's Burden' or Political Expediency?

Jaganath Pathy

The Kandha of Orissa have been enshrined in the ethnographic literature as practitioners of human sacrifice and female infanticide in the past, and the British are credited with suppressing these 'cruel customs'. A re-examination of the colonial sources exposes the fact that ethnographic reports were designed to justify the brutal repression of the indigenous people's fierce resistance struggle against colonial invasion and oppression.

THE Kandha¹ have been enshrined in the ethnographic literature as cruel practitioners of human sacrifice and female infanticide. Concurrently British rule is credited with the effective annihilation of such heinous customs within a relatively short time. Almost all the evidence till date on these abominable practices of the Kandha comes from colonial army despatches, police records and administrative reports of the period when the Kandha were putting up fierce resistance against the advancing colonists.

The British conquest of Orissa commenced in 1803 and by 1830 virtually all the Hindu kings had come under British rule. But several 'muthaheads'² of the Kandhamals,³ far from recognising British suzerainty, relentlessly continued to resist the alien invasion. In 1835, the Hindu king of Ghumsar refused to pay any tribute ('peskash') to the British, and the peasants revolted against the foreign encroachment. The rebellion was crushed with military might and the king fled to the Kandhamals with his family and treasury. The Kandha gave him shelter while the British army ravaged dozens of Kandha villages, looted their stocks of grain, and publicly hanged several Kandha leaders. In turn, the first batch of British soldiers was killed [Boal 1963: 1-7]. The ailing king died soon in one of the villages, but the entire Kandha region was in a state of unprecedented insurrection.

In August 1836, Russell, a member of the Board of Revenue responsible for controlling the disturbances, sent a brief note to the Madras government, saying that in the Kandhamals the people were notorious for frequent rites of human sacrifice and female infanticide. He suggested that in order to rule over the Kandha territory, it was necessary to revive the fairs formerly held in different localities, as well as to establish a network of new market centres where the British administrators could conveniently approach the Kandha [Selections 1854]. The officer was perhaps bound to explain the local British failure to annex the Kandha territory. Anyway this constituted the first ever written note on these pernicious practices of the Kandha.⁴

Consequently Colonel John Campbell was appointed as the assistant collector of

Ganjam district to stamp out these opprobrious practices by annexing the Kandha territory at any cost. In 1841, Lieutenant S C Macpherson succeeded Campbell. Both of them wrote and published books on Kandha ignominious rites, and a few other soldiers and administrators prepared local reports on the subject. These happen to be the only sources on the Kandha people and culture, especially on their flagitious customs. Subsequent scholars, including of the post-colonial period, have mostly reproduced, over and over again, the earlier information of the colonial soldiers *ad nauseam*, without any significant or critical evaluation.

It needs to be noted that neither Campbell nor Macpherson had any knowledge of the Kui, the Kandha language. Even their knowledge of Oriya was insignificant. Both depended upon Oriya traders, chiefs and local officers for information regarding Kandha society and culture. Their acquaintance with the Kandha was "confined to military expeditions in the winter seasons" [Bailey 1957: 177]. General Campbell's book was "bombastic, unreliable and fiercely determined to blacken the character and achievements of Macpherson who was dead when Campbell wrote his book" [Bailey 1957: 177]. And Macpherson's letters and official reports were published by his brother as 'an apology' (1957: 177). Indeed there was a prolonged and bitter jealousy between these two administrators. "For various reasons Campbell and Macpherson alternated several times with one another. When Campbell had charge, he reversed the arrangements made by Macpherson and on one occasion succeeded in getting Macpherson and his entire staff put under arrest. When Macpherson had charge, he removed and then imprisoned Sam Bisoye, in whom Campbell had frequently expressed his confidence" [Bailey 1960: 176-77]. Small wonder that little can be systematically or coherently compiled about Kandha history and culture from their writings. Yet astonishingly, their books and reports have been approvingly cited umpteen times by subsequent ethnographers and anthropologists.

Principally standing upon these official reports and books, a number of subsequent British administrators have written a few

pages each on Kandha human sacrifice and female infanticide [Dalton 1872; Hunter 1872; Frazer 1890; Risley 1891; Maddox 1901; O'Malley 1908; Thurston 1909; Russell and Hiralal 1916; Roy 1922 and many others]. Frazer on that basis even asserted that the "best known case of human sacrifices systematically offered to ensure good crops is supplied by the Kandhas" (1890: 1-384). Suffice it to state that hardly any one of them had any direct contact with the Kandha. For instance Dalton acknowledged that his:

...personal acquaintance with the Kandhas is very limited. I have seen a few in attendance on tributary chiefs, and have fallen in with some families of the tribe in the Bonai dependency; but they had been too long dwelling in a servile position amongst aliens to have retained any distinctive or typical characteristics of their race, and could converse only in Oriya (1872: 285).

Any expectation that ethnographers such as Risley and O'Malley could have verified and elaborated on the accounts of the British soldiers is completely belied. In 1885, the British government had asked Risley to make a comprehensive field survey of the tribes and castes of Bengal for better administration and also as a contribution to comparative ethnological research. Though he claimed that his work was "the first attempt to apply to Indian ethnography the methods of systematic research sanctioned by the authority of European anthropologists" (1891, I: Preface), he relied upon the information provided by James Taylor, the Tahasildar of Kandhamals, and Rev Father Schaff. They in turn asked their subordinates to administer an exhaustive interview schedule with as many as 391 questions. There was however not a single question of female infanticide, and three out of the four questions on human sacrifice were of trivial nature. And yet depending largely upon the accounts of the British soldiers, Risley wrote extensively on frequent inter-clan wars to capture wives, female infanticide and human sacrifice. Fortunately he did admit that he had serious "difficulty in ascertaining the precise form of exogamy practised by them, and indeed in getting any information at all on the subject" [Risley 1891: 1-399, emphasis

added]. If on such an unoffending subject the information could not be collected, how could he trust the soldiers to collect information on the atrocious practices of the Kandha half a century earlier?

It is true that Risley had some minor reservations about the earlier colonial accounts, but not with regard to the substantive issue of human sacrifice. He wrote:

Much has been written about the religion of Kandhas, but the subject can hardly be regarded as having yet been fully cleared up. Major Macpherson's account of the matter ascribes to the Kandhas religious conceptions of a very advanced character, quite out of keeping with their primitive social organisation, and one is inclined to suspect that the persons from whom he derived his information must have described to him rather their ideal view of what the religion of the tribe ought to be than what it actually was (1891: 1-403).

The 'meriah' (the person sacrificed) "as a victim rather than a god may perhaps have received undue emphasis from the European writers who have described the Kandha religion" [Risley 1891: 1-407]. With regard to human sacrifice, as he was "not in a position to add any fresh facts to those already on record in the reports" (1891: 1-404), he approvingly quotes from Frazer's description of the rite. The status of colonial ethnography is thus self-explanatory.

The work of another better known British scholar, O'Malley (1908), "bears the stamp of having been written at second hand from the information of local officials, and is quite inaccurate in its account of the history of the region" [Bailey 1957: 177]. This is obviously a very mild criticism. It is not a simple question of finding errors in the colonial accounts of the history of a territory or of the socio-political system, but essentially one of victimisation of an independent people through colonial constructions of customs such as widespread slaying of female infants and the atrocious crime of human sacrifice. Evidently, Bailey's own research was not directed at restoring the dignity of the people by exposing the colonial conspiracy.

That aside, the point is that neither the supposedly independent anthropologists of colonial times [Friend - Pereira 1903, 1905; Elwin 1944] nor those of the post-colonial period [Bailey 1957, 1960; Das 1956, 1960; Raman 1957; Boal 1963; Niggemeyer 1964; Banerjee 1969; Pathy 1976; Patnaik and Das Patnaik 1982] have made any significant effort to demystify the imperial power structure and the Kandha 'vile' customs. Rather by reiterating the colonial justification for annexation of Kandha lands, they have unwittingly provided much needed legitimacy to the colonial army actions and accounts.

In such a desperate ethnographic matrix, it is not easy to reconstruct the history and

culture of the Kandha. The following seeks to utilise the internal and logical contradictions in the colonial ethnography with respect to female infanticide and human sacrifice. The oral tradition is not of much help when the society, being prosecuted and intimidated for generations, has in large part internalised the guilt. Perhaps there may be still some scope for selective recovery of legends and folklore, but we have not been able to explore the possibility.

FEMALE INFANTICIDE

With a few exceptions, the Kandhas are divided into several patrilineal, exogamous septs called *gochis* and some of them are further sub-divided into sub-septs called *Klambu* [Risley 1891: II-68-69]. While septwise territorial grouping might have been common in the remote past, there is hardly any un-clan *mutha* or administrative unit. Campbell and Macpherson "frequently referred to everyone who lived in the hills as a Kandha, although in some contexts it was clear that they were talking about Oriyas" [Bailey 1960: 144-45]. Half a century after the first official reports about the Kandha were made, Risley failed to collect "any information at all" on Kandha exogamy (1891: 1-399). He wrote:

Until comparatively recent times, the contiguous septs were always at war with each other: wives were captured, female infants were slain (1891: 1-4).

By the time of Risley's study, the "brave and resolute" Kandhas of Macpherson's times [Selections 1854: 59] had been transformed into people "shy, timid and hating contact with outsiders" [Risley 1891: 1-397]. Data on exogamy were unavailable and yet clan warfare to capture wives persisted. Hunter went even further to explain the alleged warfare:

The Kandha theory of existence was that a state of war may be lawfully presumed against all tribes and nations with whom no express agreement to the contrary existed.

In a word, the practical spirit of their intercourse is the result of a conflict between the *anti-social spirit of independence which universally characterises a rude people* and the love of security and enjoyment which necessarily attends the *hereditary possession of competence and freedom* (1877: XIX-221, emphasis added).

Contrary to the colonial racist theory, Kandha legends suggest occasional inter-clan conflicts, especially with respect to encroachment on hunting and axe-cultivation territory, but not for the capture of wives [Pathy 1976: 7-8]. Indeed in the clan wars, as a principle "women were never attacked" [Bailey 1960: 15]. Arranged marriages and frequent exchange of women between the clans provided a sort of symmetry and inter-clan harmony (1960: 29-30).

Nonetheless, following the narratives of Major Macpherson of 1842 and 1845, Risley, Thurston and others have explained the prevalence of widespread female infanticide in terms of frequent clan warfare. Macpherson was told by some Kandhas (?) in 1842 that "it was better to destroy girls in their infancy than to allow them to grow up and become causes of strife afterwards" [Selections 1854: 47]. The major evidence for the prevalence of large-scale female infanticide was that during the military expeditions of Major Macpherson in 1842 and Captain Frye in 1855, they did not find a single female child in several villages [Thurston 1909: III-287]. This is no basis for criminalising a whole society. After all when alien troops march into villages, the first to escape for safety will be the most vulnerable sections, the women and children. The Kandha knew well the barbaric crimes committed against their women by outsiders, even before the British raids. On occasion agents of some neighbouring Hindu kings used to take away handsome unmarried girls by force for the king and other wealthy persons' pleasure. The practice was so rampant in certain regions that the Kandha women profusely tattooed their arms, chest and face with crocodiles, lizards, scorpions, etc. and disfigured their otherwise comely faces. This was not for purposes of ornamentation, ritual or medication. Now the practice is that no Kandha girl can marry without tattooing her face [Bailey 1957: 118; 1960: 67-68, 166-69]. The Kutia Kandha, however, appear to be an exception, perhaps due to the inaccessibility of their area [Pathy 1976: 23]. It is more logical to infer that during British military expeditions the female children escaped into the jungle rather than that they were killed at infancy.

After visiting a few Kandha-inhabited areas, Captain A. C. McNeile reported on May 12, 1857 [Selections, Madras Government No. LXXXI] that both female and male infanticide was prevalent to an "appalling extent". The practice allegedly was based upon the prediction of the priest that the child would bring misfortune and grief to the family. Had this been true then the Kandha population of the region would not have survived long, let alone engaged in a struggle for decades against the mighty British power.

Dalton explained the practice of female infanticide among the Kandha in terms of the high expenses of the marriage rites and high prices for wives of their own tribe. Thus "they killed their own girls and purchased wives from other parts of the country" (1872: 289). There is no evidence whatsoever that the Kandha were not a strictly endogamous community. Besides, if brideprices were so high, why would parents kill their daughters? And which neighbouring communities were there to sell their daughters

to the Kandhas? Moreover, as there was no money economy, what surplus goods were exchanged to purchase the girls? Without any scrutiny, Dalton simply relied on Russell's report of 1836, whose real agenda was to victimise the Kandha and legitimise brutal colonial repressions. Of course, recent writers hardly make any departure from the colonial reports. For instance Watts wrote that the Kutia Kandha practised female infanticide as late as 1950, for "their self-esteem did not permit their daughters to marry outside their tribe", and "they were too poor to afford the expenses of wedding ceremony" (1970: 49-50).

It is true that some of the ethnographers doubted the reliability of initial British army despatches and denied its universal character. Female infanticide was said to have been confined to the middle Kandha region, and even there some tracts like Digi and Bodo Ghoru were honourable exceptions [Dalton 1872: 289]. It prevailed in about 2,400 square miles inhabited by 60,000 Kandhas, and on an average between 1,200 to 1,500 female infants were destroyed annually [Thurston 1909: III-385]. As there was no record of births and deaths, one wonders how the figure was arrived at.

To explain why certain Kandha regions were exceptions to the practice, we are told that those Kandhas who offer human sacrifice did not practise female infanticide; the former worshipped the earth goddess whereas the latter neglected her in favour of the sun god [Thurston 1909: III-392-93]. Those who practised female infanticide believed that women made the world suffer and hence avoided the rebirth of deceased female ancestors in the same families [Dalton 1872: 289]. In contrast to this observation that the Kandhas practised either human sacrifice or female infanticide, the earlier records asserted the practice of both customs by the same sections of the Kandhas and indeed most other writers of both the colonial and post-colonial periods made no such distinctions. In other words, not finding any report of human sacrifice in large tracts of Kandha territory, some such as Dalton and Thurston provided this explanation.

Whereas it may be methodologically inappropriate to evaluate colonial ethnography in terms of the contemporary status of female children and women, the near-total absence of any data base left by British administrators leaves little choice. Among the Dongria Kandha, "longing for children, irrespective of any sex, is very common", and a baby of any sex is considered to be the blessed child of Dharani Penu – earth goddess [Patnaik and Das Patnaik 1982: 103]. In fact, "female children are valued most... because women are a great economic asset" (1982: 89). Among the Kuvi Kandha all children are treated with great affection and love [Banerjee 1969: 18]. And "to be

1. **Child Labour in Carpet Industry – A Status Report** by *S. Vujaygopalan*

Price: Rs. 120.00 (Postage charges: Rs. 10.00)

The study analyses the issue of child labour and examines the socio-economic conditions of the carpet children in the Bhadohi-Mirzapur belt of Uttar Pradesh.

2. **Human Development**

Price: Rs. 120.00 (Postage charges: Rs. 10.00)

Special Issue of NCAER quarterly journal *Margin* contains specially commissioned articles on human development.

3. **Household Survey of Health Care Utilisation and Expenditure (January 1995)**

by *Ramamani Sundar*

Price: Rs. 120.00 (Postage charges: Rs. 10.00)

This is the second such study by NCAER. It collected information on the prevalence of illness, utilisation and sources of health services, types of providers, systems of medicine used and the distances travelled to seek treatment. It is a national survey and gives information by states as well.

father of many daughters is not a calamity for a Kandha" [Bailey 1960: 94]. The daughters never share in the inheritance of the parental property [Risley 1891: 1-403].

Most marriages require payment of brideprice which includes buffaloes, cows, goats, brass plates, cooking vessels, ornaments, etc [Risley 1891: 1-402]. The brideprice demanded by the girls side is high, but not too high, because when the girl goes to her husband after about a year she must take with her somewhat more than what her family received. The dowry amount cannot be very much more than the brideprice for that would disgrace the groom's family [Bailey 1960: 30]. In case of marriage by elopement or capture, brideprice is still obligatory, although the amount will be less than that of marriage by negotiation. In other words, there is not much justification for marriage by capture.

Instead, marriage by service has been used as an alternative measure to meet the demand of bridewealth. The groom is expected to serve in his future father-in-law's house for some years before solemnising the marriage [Russell and Hiratal 1916: III-467]. The other options are marriage by exchange and levirate or sororate marriage. The cost is much less in case of marriage to a widow, a divorced wife, or to cross-cousin. Some village studies have recently shown that only a fifth of the marriages are by capture whereas one-third are by elopement with mutual consent, one-fourth by negotiation and one-eighth by service [Banerjee 1969]. In brief, the complex nature of brideprice and the alternative forms of marriage, amply demonstrates that clan warfare to capture brides, high cost of marriage and consequent female infanticide, are largely fabrications of British soldiers and administrators. Further, if there were large-scale female infanticide, the consequent shortage of women would have led to some form of polyandry. Instead, polygamous marriages were sanctioned. A micro-study found that 14 per cent of all marriages was polygamous [Patnaik and Das Patnaik 1982: 70].

Curiously, almost all the colonial ethnographers noted that women hold a high position in Kandha society. The Kandhas faithfully observe the marriage tie, adultery is seldom heard of [Hunter 1877: XIX-225-27]. Husbands treat their wives kindly [Risley 1891: 1-402]. The "husband never shows any disrespect to his wife and seeks her advice in all social and economic matters" [Patnaik and Das Patnaik 1982: 72]. When the women enjoyed such a position in the society, why were their daughters slaughtered?

The best way to explode the myth of female infanticide would be by genderwise population data. But unfortunately before 1872, most of the Kandha-inhabited areas, especially the princely states, had no census

[Hunter 1877: XIX-203]. Even the census of 1872 was collected through the kings' officials, police and revenue department. In the Kandhamals, the strength of males above 12 years of age was lower than that of females, although the proportion of males was 51.6 per cent when all age groups are combined. In the tributary states as a whole, females above 12 years outnumbered their male counterparts (51.2 per cent) among the indigenous peoples [Hunter 1877: XIX-205]. Granting the inadequacy of the census data, it is evident that there was no female infanticide as a social practice.

The 1881 Indian census was incomplete; it put the Kandha population at only about 2,50,000, while in the 1891 census, they numbered 6,27,000. Their number increased to 7,41,000 in 1931, 7,45,000 in 1941, 7,50,000 in 1951, 8,20,000 in 1961 and 8,70,000 in 1971. In the Kandhamals their strength increased from 59,000 in 1891 to 80,000 in 1951. In other words, demographic growth has been continuous. Some of the village studies have shown a slight preponderance of females over males [Banerjee 1969: 14, Pathy 1976: 17]. But since female infanticide is said to have been effectively stopped by the 1850s, these figures are not of much significance. Nonetheless, on April 7, 1881, C F MacCartie, the special Assistant Agent of Ganjam, reported from Baliguda that "the Daringbadi census shows 1,229 Kandha girls as compared to 1,127 boys. It is the conclusive evidence that there is no infanticide where 30 years ago not a single girl child was to be found" [cited in Patnaik and Das Patnaik 1982: 303].

If there was female infanticide, it must have been very rare, performed in circumstances of serious external political threat of dishonouring women. Risley, in one of his incisive statements mentioned that "such savage infanticide is an incident of the primitive struggle for bare existence which disappears when the severity of the struggle is alleviated by peace" (1891: II-lxxv). The fact that the practice was effectively prohibited within a short period may imply that either it was a manufactured colonial myth, or a product of the crisis in the political economy emerging from incessant British wars. It had no general social sanction. In short there is neither logical nor substantive support for the theory that the Kandha practised female infanticide and yet colonial as well as contemporary ethnography has wittingly or otherwise accepted it and thereby dehumanised and demoralised a once powerful and independent people.

MERIAH SACRIFICE REVISITED

In order to evaluate the infamous practice of human sacrifice, a brief outline of Kandha religion may be useful. The often cited paper

of Captain Macpherson (1852) holds that the Kandha believed that the supreme god created for himself a consort – the earth goddess, the source of evil. The god of life and his rebel consort contended for superiority until the elements of good and evil became thoroughly co-mingled in man and nature. Hunter adds that "their conception of nature of god is one of chronic hostility to mankind, mitigated at intervals by outpouring of blood" (1877: XIX-232). The Kandha pantheon consisted of the supreme god and 83 gods [Russell and Hiratal 1916: III-473; IV-139, 550]. Hunter noted that there were 14 great deities, 11 minor divinities and a large number of Hindu or mixed ones (1877: XIX-232-33). The gods had neither images nor shrines. A few writers have doubted the authenticity of Macpherson's account of Kandha religion, especially of their belief that every person is endowed with four souls, one of which is destined to suffer punishment for sins and complete the round of transmigration, and one of which will join the gods [Russell and Hiratal 1916: III-227, 230; Ghurye 1943: 265].

The philosophy of any religion survives much longer than the specific rites, hence referring to recent studies on the topic may not be out of place. Among the Dongaria Kandha, the shrine of the earth goddess is lodged in the middle of the village, and near that a wooden post of three to four feet height, representing her husband (Jhankad), is placed. The earth goddess is "respected with high esteem as the creator of the world and does not ordinarily cause any harm to men, and enlivens as well as protects them from pestilence, depravity and evil" [Patnaik and Das Patnaik 1982: 139-41]. My field notes in the early 1970s in the Kandhamals reveal similar conceptions. Colonial information on the absence of a shrine, the theory of irreconcilable contradiction between the supreme god and the mother goddess, and the evil and vindictive nature of the female deity – on which the whole conception of human sacrifice rests – bear little scrutiny.

Descriptions of meriah rite of human sacrifice are to be found in the accounts of soldiers of the East India Company, especially Macpherson (1865) and Campbell (1861). Russell prepared the first report during the raids by British troops to control the uprising in the Hindu kingdom of Ghumsur in 1835 and Kandhamals in 1836, where the first batch of the British troops was killed by the Kandha. He reported that "a whole people practised human sacrifice and female infanticide on a scale and with a cruelty which had never been surpassed by the most savage of nations" [cited in Dalton 1872: 285]. Subsequent ethnographers mentioned a few exceptions. Only one section of the Kandha which worshipped the earth goddess for the fertility of the soil

practised human sacrifice, while the other section which worshipped the supreme god held human sacrifice in abhorrence [Dalton 1872:286]. In addition, there were Kandhas who neither practised human sacrifice nor female infanticide, especially those who lived in the districts of Sarangad, Chandrghari and Degi of Kosadah [Dalton 1872:291]. Even in the Ganjam Maliahs, some muthas like Kurtilli did not practise human sacrifice [Thurston 1909:111-380].

At the same time there were reports of inclusion of non-Kandha people in the practice of human sacrifice. The officers of the meriah agency stated that "there was reason to believe that the Raja of Jeypore in 1860-61 sacrificed a girl of 13 years at the shrine of the (Hindu) goddess Durga in the town of Jeypore" [Thurston 1909: 111-379]. The Hindu king of Bastar had allegedly sacrificed 27 adult males on a single occasion [Dalton 1872:290], as did the king of Anugul. These were some of the kings who provided leadership to the Kandha at different times in their struggle against colonial invasion. The immigrant Oriya settlers of the Kandhamals were also "fully committed in the Kandha ritual of human sacrifice" [Bailey 1957:132]. Given the system of exclusion and inclusion, it is difficult to ascertain which community was the originator of the practice and which one the eventual follower. From the British records, it is even difficult to ascertain who used to sponsor the ceremony for the propitiation of the earth goddess. Russell's report of 1837 mentions that human sacrifice is offered annually by rotation in certain muthas, while Macpherson indicated the group concerned was the clan. But they are not explicit [Bailey 1960:51]. Risley wrote that the periodical sacrifices by the tribes and divisions of tribes was so arranged that each head of a family was able to procure a shred of flesh for his fields once in a year (1891: 1-402). Some others hold that the ceremony united the "whole Kandha race" [Hunter 1877: XIX-234].

Similar confusion exists with regard to the rites and the victims. Based on the accounts of Macpherson and Campbell, Frazer wrote that the victim

...was acceptable to the goddess only if he had been purchased or had been born a victim – that is the son of victim father – or had been devoted as a child by his father or guardian. Knonds in distress often sold their children for victim considering the beatification of their souls certain and for the benefit of mankind, the most honourable possible (1890:1-387).

In contrast, Hunter noted that "Brahmans and Kandhas were the only races whose purity exempted them from sacrifice" (1877:XIX-236). Captain Campbell in 1838 claimed to have released 100 meriah children who belonged to all races, religions, and castes, including several Kandha children

[cited in Dalton 1872: 290]. Risley also noted that Kandhas in distress often sold their children for meriah (1891: 1-406). The Kutia Kandhas of Belghar sacrificed only a man or woman of their tribe who had been dedicated for the purpose from birth [Watts 1970:48]. But among the Kuvi Kandhas, the victims used to be Kandhas other than of their own community [Banerjee 1969: 167].

Leaving aside the confusion as to whether Kandhas were excluded from the sacrifice, it is intriguing that some of them sold their children for the purpose due to economic distress. Given the fact that everyone had the right of access to slash-and-burn cultivation land and to forest produce, the widespread reciprocal exchange of labour and goods among the kin, and the institutionalised obligation of the social or spatial unit to assist a family in want, it is hard to comprehend how some Kandha families found it difficult to survive to the extent of selling their children for the human sacrifice. Besides, due to the prevailing communal responsibility for the repayment of debt, the Kandha considered contracting debt as one of the nine cardinal sins [O'Malley 1934-95]. Hence indebtedness could not be the cause of hardship. Dalton was perhaps a bit sceptical on the issue of selling children as meriah and thus wrote that "as a rule, victims from their own tribe were not procurable", except in very rare cases (1872:286).

Whether it is a Kandha or non-Kandha meriah, he/she should be purchased. Criminals or prisoners captured in war were not suitable subjects for sacrifice. "A rule came down from the remote antiquity that the victim must be bought with a price" [Hunter 1877: XIX-236]. Thus at the time of sacrifice, they chant that "We bought you with a price, no sin rests with us". All accounts suggest that the Kandha purchased meriah through the Hindu low caste Panas, who lived in and around the Kandha villages. Existing evidence points to the immigration of this caste to Kandhaland less than 200 years ago. They came after being exiled from some of the neighbouring Hindu kingdoms for their alleged involvement in thefts and robbery. The Kandhas gave them shelter in their villages, and they in turn acted as mediators between the Kandhas and the Oriyas, and worked as weavers and petty traders [Thiady 1965:7; Pathy 1976:1-9]. In other words, if the Panas were the sole procurers of the victims, the tradition of human sacrifice by purchase of victims can at best be traced to the end of the 18th or beginning of the 19th century, which almost coincides with the East India Company's attempts to annex the territory.

In any case, in order to purchase the human beings – wives or meriahs – the Kandha should have been producing the considerable surplus needed for the exchange. But before

1855, there is no mention of the existence of trade and commerce in the Kandhalands in the British administrative reports. The solitary note of Macpherson is sketchy for it did not specify details of the who, what and where of such transactions [Pathy 1976]. In fact, Hunter stressed that in "Lieutenant Macpherson's time a true Kandha husbandman knew nothing about money, and detested trade of every sort" (1877: XIX-230). Bailey also noted that by tradition the Kandhas were agriculturists and "had contempt for those who engage in trade, and for those who have any dealings at all with foreigners" (1960:205). In the Kandhamals before the 1850s, "there were no markets and... each village was self-sufficient economically... The same goods were produced and consumed within the village. There was so to say no foreign trade" [Bailey 1969: 125-26]. The Kandha did grow turmeric and a little oilseed, but there is no way to know how much of these crops went for exchange. It is reasonable to presume that the turmeric was traded and that some of this trade "was carried on by merchants travelling in the hills – which indicates that the area was safer than one would imagine from other (colonial) accounts" [Bailey 1957: 144]. Probably there was no large-scale turmeric cultivation before the immigration of the Panas. In any case, purchase of human beings by turmeric or by goods exchanged for that – as there was no money in circulation – appears both impossible and illogical.

Turning to the rites as reported by colonial mercenaries, administrators and ethnographers, it may be briefly noted that human sacrifice was offered to the earth goddess, and pieces of flesh were buried in the fields to ensure good crops, especially "the deep red colour of turmeric", and immunity from diseases and accidents [Frazer 1890: 1-386]. The sacrifice was declared for all mankind. Despite the risk of digression, it needs to be noted that the colour of turmeric is not blood red but deep yellow. All societies distinguish between green, yellow and red, and certainly the Kandha could never have confused red with yellow. Obviously then, it was the colonial characterisation of them as 'savage primitives' that legitimised the myth of such a confusion.

The victims purchased from the Panas were treated with extreme affection for years together. On the day of the sacrifice he/she was anointed with oil, ghee and turmeric and adorned with flowers. The victim must not die in bonds; and to prevent escape the arms or legs were broken [Dalton 1872:287] or he/she was stupefied by a large dose of opium [Campbell, 1861:113; Macpherson 1865:119], or drowned first in the blood of pigs [O'Malley, 1908:90]. He/she was systematically tortured and mutilated in a most gruesome manner. All efforts were

made to prolong the life as long as possible for the "more the tears shed more the rain would fall on the crops" [Watts 1970: 49]. The sacrifice was carried out by strangulation with a slit bamboo [Thurston 1909: III-368], or by cutting up alive [Dalton 1872: 288], or by violently beating the head with heavy metal. Then the flesh was taken by representatives of different villages for distribution and put in their fields. The rest of the victim's body was either burnt and ashes scattered over the fields, or sometimes buried [Russell and Hiralal 1916: III-471-75]. The meriah's flesh and ashes were believed to be endowed with the magical power of fertilising the land and the blood and tears for the redness of the turmeric and production of rain respectively. The meriah thus appears as divine but is treated as a victim by the European writers [Russell and Hiralal 1916: III-478].

Astonishingly some nationalist scholars such as Ghurye (1943: 263-67) treated the Kandha practice of human sacrifice as agricultural magic to restore the exhausted fertility of mother earth. But why would predominantly shifting cultivators in the hills be concerned with agricultural magic to restore fertility? It might be more appropriate for settled plough cultivators than for swidden cultivators. The mountains are controlled by other gods. In any case, if the sacrifice were offered to the earth goddess then the women would have been prohibited from disturbing the land surface, but Kandha women are free to dig and plant seeds in swidden plots. One therefore presumes that the Hindu conception of agricultural magic in the scriptures was inadvertently extended to the Kandha context without any scrutiny. Incidentally, in the first reports it was an earth god but later on was called earth goddess.

The horrifying details of the sacrificial rites are not recounted here. The most important point to be stressed is that nowhere in the voluminous reports is there a single eyewitness account. All the narratives are based on information collected from Oriya and Bengali subordinate officers and liquor traders. The Oriya stereotypes and images of the Kandha must have influenced the stories told by them.

Evidence also came from the existence of a sacrificial pillar in a village of Baliguda which is currently kept in the Madras museum. But if it was so widespread, why were not a few more located? The major support is derived from the surrendering of a large number of meriahs to the British authorities. In 1837, Russell reported that 29 meriahs were surrendered, and the following year Captain Campbell managed to release 100 meriah children. In 1848, after the Kandhas were subjugated in Anugul, 235 meriahs were handed over to Campbell. Again in 1855, he rescued 294,

including 117 females. In 1859, 206 more were handed over, and Captain McNeile rescued another 100 meriah children [Dalton 1872: 289-93]. Presuming that a much larger number might not have been formally surrendered, one is tempted to presume that the Kandhas were rich enough to buy thousands of humans for sacrifice.

Most of these surrenders occurred in those parts of Kandha country where resistance struggles against the British annexation were fierce and guerrilla warfare formidable. It is thus difficult to distinguish the number of meriah victims surrendered from those taken as captives or prisoners of colonial war. Of course, the army despatches imply there was very little use of force to achieve the surrenders [Patnaik and Das Patnaik 1982: 3]. The "Kandhas were inclined to yield to mild coercion" [Dalton 1872: 289]. It seems during the military expeditions in the winter months the British soldiers effectively persuaded the Kandhas that "fertility and prosperity could be had without human sacrifice." But inadvertently perhaps, "the same officers described how villages were burned, stores of grains destroyed and the leaders of the Kandhas flogged or hanged" [Bailey 1960: 176]. Besides, if human sacrifice was the integral rite of the Kandha, why did they hand over their prized possession of victims without any resistance, and that too from the very first years of British involvement?

The practice is said to have continued longer in some parts such as Ghumsar, Boad, Kandhamals, Kimediy, Jeypore, Anugul, Kalahandi, Patna and Bastar. As a final sacrifice the Boad Kandhas are said to have killed 125 meriahs in 1844 [Macpherson 1865: 246]. The last recorded meriah sacrifice in the Ganjam Maliahs occurred in 1852, and among the Kutia Kandhas in 1880 [Thurston 1909: III-378]. Nonetheless, in 1902 the Ganjam Kandhas seem to have petitioned the district magistrate "to allow the resumption of human sacrifice as an emergency measure on account of drought and scarcity" [Thurston 1909: III-380, O'Malley 1934: 94]. Despite all efforts neither Bailey nor I were able to trace the petition. There is reason to doubt whether such a petition was ever made, and in any case, who petitioned and why is this alone missing from the record?

When the Rampa rebellion of 1879-80 spread to Vizagapatnam district, it seems "several cases of human sacrifice occurred in the disturbed tracts" [Thurston 1909: III-379]. It needs no reiteration that whenever and wherever Kandha insurgency increased, the practice of human sacrifice appeared in the official reports, and on that basis repression was let loose.

Evidence for the revival of human sacrifice is even flimsier. For instance:

In 1883, a man was found at daybreak murdered in one of the temples in Jeypore in circumstances which pointed to his having been slain as a meriah, and as late as 1886, a formal enquiry showed that there were ample grounds for the suspicion that the kidnapping of victims still went on in Bastar [Thurston 1909: III-379-80].

These were only suspicions. Moreover, sacrifice in a temple and kidnapping of the victims for sacrifice stand in contradiction to the earlier writings on the Kandha system of sacrifice.

The fragile data base, the internal and logical contradictions in the reports, and the association of such reporting with Kandha uprisings against annexation of their territory, encroachment on their land and forest resources, imposition of forced labour and increasing taxations, imply that there were more significant facts concealed by the myth of suppression of meriah sacrifice. From the foregoing discussion, though one cannot be totally confident of the absence of any human sacrifice or female infanticide in the region, the fact of its exaggeration and distortion for colonial partisan ends, is beyond doubt.

ETHICAL QUESTION OR POLITICAL EXPEDIENCY

In conformity with the then popular indological theory of the Aryan invasion either annihilating or pushing back the indigenous peoples into the interior inhospitable jungles [Bhowmick 1982: 297], British administrators such as Macpherson (1842) noted that the Kandhas were pushed into the hills by the Aryans who in turn displaced the docile Kurmo of the region. There is no way of knowing the actual history. There is no trace of the Kurmo in the recorded history of the area, and the economy of the Kandha is best suited to their present habitat than to the plains [Pathy 1984: 44-52; Kosambi 1975: 41]. In any case, the Kandhas were in entire possession of the territory and were the rulers of the country when the Oriyas arrived [Russell and Hiralal 1916: III-465]. After the 9th century, the numerous surrounding Hindu kingdoms were periodically engaged in wars among themselves as well as with the Kandha to assert their rule over the hills of adjoining territories [Bailey 1957: 178]. The Kandha strongly opposed any alien political domination, but eventually around 350 years ago, some of the kings managed to send some of their subjects from the plains to curb the resistance struggle of the Kandha and protect their own frontiers from Kandha raids and guerrilla warfare. These immigrants established a few fortified and separate settlements in the hills [Pathy 1976: 5-7]. Depending upon their power and popularity,

they were able to expand their domination beyond these Hindu settlements. This history is based on British accounts; the immigrant Hindu people opine that their ancestors were pushed into the area due to their inability to survive in the plains as well as intra-village factional fights [Bailey 1960: 25-26].

Some Hindu kings divided the annexed parts of Kandha land into several muthas, mostly on the basis of a single clan or of several fraternal clans [Behura and Sahu 1970: 13-21]. The muthaheads were recruited from among different communities. Knowing both Oriya and Kui, they were made responsible for controlling the Kandha movements for independence and were supposed to pay a certain amount of annual tribute to the Hindu kings. But given the fluctuating power of the kingdoms and the difficult terrain, in course of time the muthaheads retained only the loosest ties with the Hindu kings [Bailey 1957: 7]. There is also reason to agree with Bailey that the "actual influence of the Oriya chiefs may have been exaggerated because the servants of the East India Company" depended upon the Oriya speakers (1957: 27).

While neither the kings [Selections 1854: 78-89] nor the muthaheads enjoyed overwhelming power of domination in the Kandhalands, the Kandha had customarily good relations with a few kings. In Kalahandi, for instance, the prince on his accession to the throne had to sit on the lap of a Kandha and ritually marry a Kandha girl. This may denote that the kingship derived its power from the Kandhas [Russell and Hiralal 1916: III-465]. Until the Kandha installed the king, he was not formally recognised as such [Patnaik and Das Patnaik 1982: xiii]. Suffice it to state that the Kandhas were not subjugated by the Hindu states, and they were also credited with driving away the Muslim invaders again and again from their territory [Hunter 1877: XIX-219].

After bringing Orissa under its control in 1803, the East India Company unsuccessfully tried intermittently to annex the Kandha inhabited territory. In 1835, the company acquired the Ghumsar kingdom. But neither the king nor the subjects were prepared to accept British domination. The revolt was suppressed and the king fled with his family and treasury to the Kandhamals. The Kandha refused to give up the Ghumsar king to the British troops. Hunter wrote: "The country was laid utterly desolate. The population was unceasingly pursued by our troops, and it was only the treachery of Hindu borderers that, by betraying them into our hands, brought the sickening struggle to a close" (1877: XIX-229). Many hill chiefs were caught and publicly hanged as testimony to British power. The Kandha in retaliation massacred scores of British soldiers in several encounters; this was when human sacrifice and female infanticide were discovered.

The resistance struggle was continued under the leadership of both Kandha and Oriya chiefs. The most influential Kandha leaders were Mahadeb Khonro and Nowbhum Khonro in the Boad region [Huttmann 1847: 273-341] and Oriya chiefs Dora Bisoi and Sam Bisoi [Macpherson 1865: 47]. When Dora Bisoi was shot dead, Onkaro Chokro Bisoi, a former muthahead, led the struggle, and hundreds of British soldiers were killed in the encounters. These leaders were instrumental in keeping away the East India Company from the Kandha lands from 1844 to 1855.

Meanwhile the people of Anugul rebelled and resisted fiercely British annexation. The king was implicated in 1846 as a party to human sacrifice. Troops were employed on a large scale, and all authority was temporarily transferred from the agent to the officer in command, Brigadier General Dyer. For two years the repression continued, and the king was captured and his estate confiscated [Dalton 1872: 289]. Then the British soldiers claimed on April 1, 1848 that 235 meriahs were handed over in Anugul [Selection 1854].

Again in 1856, following the British annexation of Kandhamals (1855), struggles erupted there and spread to Ghumsar under the leadership of some Oriya muthaheads. Guerrilla warfare continued until about 1874. During this long period, the Kandha had established areas liberated from both the British and the feudal rulers of the plains. After 1869, the British subjugated a few Oriya muthaheads and a few village headmen in other muthas [Pathy 1976: 11-19]. It seems the Oriya muthaheads played a dual role, some siding with the Kandha and some with the company, while the majority kept an uneasy balance until it was clear that the Company was going to win. In brief, the Kandhas of Kandhaland fought a long battle for several decades and made great sacrifices before they were defeated by the mighty British power.

Elsewhere, there were also movements against British policy. In 1865, the Kutia Kandha revolted against police excesses and forced unpaid labour for construction of roads during the agricultural seasons. This was repeated again in 1866 and 1877. In 1872, the Kandha of Chandragiri mutha rose in revolt against the arrest of their fellow villagers. In 1881-82, the Kalahandi Kandha rebelled against the mismanagement of the king. The king had encouraged the settlement of the agricultural caste of koltas, who alienated their fertile lands and were involved in usury. The Kandhas killed a few hundred kolta landlords and traders. The British repressed the anti-feudal struggle with many untold excesses and much bloodshed. Seven of their leaders were hanged and another was convicted and executed for allegedly offering a five-year-old girl as meriah to the earth

goddess. Similarly in 1894, the Kandhas of Nayagarh revolted against the involvement of the British in the selection of the king. In 1898 near Gudar, four constables were thrashed and looted. These are only a few of the recorded revolts; many more remain to be recorded.

The Kandha struggles of the 19th century can be best understood in relation to British policies. Initially the colonial strategy was to subjugate the Kandha by the use of force, and afterwards a mixture of force, concessions and indoctrination followed. Macpherson strove to buy the village heads and priests with presents. A few plains Kandhas were recruited to an irregular police force on the belief that who else can better "bully their fellow Kandhas on the strength of their police uniforms" [Patnaik and Das Patnaik 1982: 306]. This helped the colonial system. Macpherson advocated raising a Kandha battalion to deal with the mountain races of Orissa. Campbell was anxious to see the penetration of Christian missionaries, and all officers pressed for the expansion of roads and markets.

In 1855, the East India Company issued a proclamation that the Kandhas would not be taxed, there would be no forced labour, and the existing social and political institutions, including the hereditary authority and privileges of the leadership, would be retained. Also it was assured that the British government would not interfere in any way with the "established usages and principles of justice" [Bailey 1960: 181]. Where movements erupted intermittently, the British administrators promised more and more safeguards. For instance, following the Kandha war of resistance in Angul, the Angul Laws Regulation was passed in 1897, which provided economic protection from Oriya exploiters and restricted land alienation and money-lending. In the agency tracts of Madras presidency following the Kandha struggles against land alienation in 1869-70, the Agency Tracts Interest and Land Transfer Act-I was passed in 1870, which legally prohibited the transfer of Kandha lands to non-Kandhas without the express permission of the British authorities. Meanwhile after several decades of warfare, the British administration at last acknowledged in the late 1850s that the Kandha resistance struggles were not so much to protect their customs but "because they feared their land would be taken or taxed" [Bailey 1960: 181].

It may be added that the British conception of property being one of individual ownership, the administrators never comprehended the local corporate-based occupation and use of land and land-based resources. The notion of 'res nullius' was adopted to usurp the corporate resources of the indigenous peoples. Risley wrote that the Orissan Kandhas,

... claim full rights of property in the soil in virtue of having cleared the jungle and prepared the land for cultivation. In some villages individual ownership is unknown, and the land is cultivated on a system of temporary occupation subject to periodical redistribution under the orders of the headman or malik (1891: 1-408).

Given such ignorance of the concept of group rights and the nature of axe cultivation, it was not surprising that the company thought initially that prolonged military expeditions into Kandhaland was costly. The local administrators could persuade the Company only on the moral grounds of suppression of female infanticide and human sacrifice [Bailey 1960: 70].

The aforementioned promises were given when the British were finding it difficult to conquer the people and there was a clear danger of uprising in the recently annexed territories [Bailey 1960: 182]. But once the colonial system consolidated itself through the recognition of the muthaheads, all the promises of Kandha rights and property were violated unilaterally. The Kandhas were forced to pay plough tax, cess tax and watchman tax in 1875, besides a large number of dues ('mamuls'), such as when someone dies or marries, for mediating in marital and land disputes, and so on. Around 1870, they were prohibited to distill liquor, practise axe cultivation, marry by capture and perform many religious rites. Several Christian missionaries infiltrated the area and started proselytising and deculturalising the Kandha. The first church was established at Digi in 1894 and the second in Katinga. Several roads, bridges, schools and government rest houses were constructed with compulsory unpaid labour ('bhetti') of the Kandha. And since 1875, every household was forced to pay one-fourth of a rupee for the road construction fund, which was increased and continued until independence [Thiady 1965: 25-31, 59-60]. In addition, at frequent intervals Kandhas (including the recalcitrants) were sent to work in the Assam tea plantations. In 1917, several thousands were taken to Mesopotamia to serve in the world war [Boal 1963: 61].

Oriya migrant distillers were given licences to open liquor shops in the Kandhamals. This was aimed at increasing the excise revenue and controlling and contacting the as yet unsubdued Kandhas. It may be noted that the Oriya intelligentsia were reluctant to enter the bidding precisely because service in the region was considered "almost equivalent to death sentence" [O'Malley 1908: 77]. The Ganjam distillers, having lost their profession, were too delighted to open their shops with British patronage. There were as many as 470 shops in the 800 square miles area of the Kandhamals. Very soon many Kandhas lost their land. That is why at least since 1887, there were sporadic

agitations against the excise policy and the Oriya liquor merchants. Consequently the British government was forced to enforce prohibition and to close all the liquor shops in 1910.

After annexation of the Kandhamals, Dinabandhu Patnaik, who had been a corporal in the irregular cavalry, became the tahasildar. He ruled with great ferocity and indulged in systematic pillage for almost a quarter century [Bailey 1957: 32]. The Oriya muthaheads were encouraged to expropriate at will, including perquisites such as a share of the harvest, a gift on the occasion of a wedding or a funeral feast; contributions to the funerals and weddings in the muthahead's, tahasildar's and his subordinates' families; free hospitality, labour and entertainment during the tour of officials in the villages, and so on. This was colonial exploitation with the greatest degree of excellence.

CONCLUDING COMMENT

What does this add up to? And what can be drawn out for a meaningful critique of colonial ethnography? There are three obviously simple points with which I would like to conclude.

First, the task of re-examining colonial ethnography and demystifying and exposing the colonial conspiracy is far from easy, especially when post-colonial scholars remain captives of the premises of colonial soldiers, administrators and ethnographers. This paper has indulged in some polemics; but polemics are of crucial significance in bringing down the facade of truth and exposing political abuse in the name of 'white man's burden'. Though primarily based on colonial texts, an attempt is made to go beyond, to the context of asymmetry of power and frequent resistance. Highlighting logical inconsistencies and internal contradictions in the colonial texts does contribute to the unravelling of colonially constructed falsehoods and exposing the discursive partiality of cultural and historical 'truths'. But this is not sufficient to demystify colonial ethnography and exhume the long buried truths of the indigenous peoples' fierce resistance against colonial invasions and oppressions. It is obviously more than a simple matter of noticing an error, bias or omission.

The crucial issue is to expose the extent of enmeshment of ethnographic reports with imperial power as reflected in colonial brutalities to silence the indigenous peoples' struggles for autonomy, survival and independence. Several post-colonial anthropologists concerned with the Kandha, having treated colonial ethnographic knowledge as distinct from colonial domination, inadvertently became the inheritors of the colonial system of hegemony. As we may recall it was only

when the British tried to encroach upon the territory of the Kandha people and faced recurring retaliations that the colonial soldiers discovered the Kandha practices of female infanticide and human sacrifice. This gave them a free hand to embark upon a medieval war of extermination and subjugation. The Kandhas were characterised as savage, bloodthirsty marauders, the objects of guilt. And not astonishingly, the same people, once subjugated, were portrayed as shy, timid, passive, hospitable and cheerful. In either case, the uncritical 'absolute' dependence on some of the Oriya middle class and traders, who were inherently and intentionally prone to misrepresentation and exaggeration due to their long hostility to the Kandha and who thus had the urge to provide information palatable to the British soldiers looking for legitimacy for terror, annexation and hegemony, provides little trustworthy clue to the society and culture of the Kandha.

The distorted ethnography not only legitimised colonial terror and brutalities but also dehumanised the Kandha, who eventually internalised the degradation and transformed the conquerors into altruistic benefactors and self-sacrificing partners striving for the good of humanity and civilisation. That is why Kandha ethnography cannot be fully demystified through an examination of folklore and oral traditions. Careful utilisation of such sources may at best tangentially help to locate the broad historical tendencies affecting the material and cultural life of the Kandha. The best course to pursue is to locate ethnographic and administrative reports with reference to forms and periods of Kandha militancy, confusion, submission and compromise. Unfortunately this paper has not been able to enter into such a demanding complexity.

Second, by outright exaggeration of exotica - manufactured or otherwise - and subtle distortion of events, colonial ethnography has been able to capture the minds of the Kandha. Put simply, the tragedy of the Kandha is alienation from the past and internalisation of one and a half centuries of colonial and post-colonial propaganda about their cultural inferiority and their ancestors' heinous crimes and barbaric customs of female infanticide and human sacrifice. The memory assigned and the ethnography produced about their past, even if totally false, is contemporarily rooted, at least among the 'acculturated'. No serious analyst can separate this out of the context of their half century-long resistance against the intrusion of the mightiest power of the world, the subsequent intimidation, persecution and general trauma plus the repeated circulation of unsubstantiated accounts of customs and crimes of their forefathers even in the post-colonial era. In sum, several generations of the Kandha,

their society and culture have been victimised by manufactured myths and colonial partisan interests, and there is little respite even now

Third, the task is to present the Kandha with their own history and ethnography, written from their own point of view. Such a possibility can only be contemplated in the context of a Kandha national struggle for safeguarding their identity and resource base. But such a development is yet to materialise. Meanwhile liberal and radical scholarship could and should try to dismantle and demystify the so-called truths of colonial times by associating so-called heinous practices with the existing systems of political, economic and institutional power, which produced and sustained the information or myths. It is not "a matter of emancipating truth from every system of power, but of detaching the power of truth from the forms of hegemony, social, economic and cultural, within which it operates." [Gordon 1980: 133].

The task is formidable and of crucial significance, not simply with regard to the Kandha but also to hundreds of other indigenous peoples who have been criminalised in the name of knowledge, science and civilisation.

Notes

1 The Kandhas are also known as Kandh, Kando, Khond, Khondho, Kondhy and Kondh. These epithets are likely to be exonyms bestowed by their Hindu neighbours that were subsequently accepted by colonial and post colonial ethnography. In fact Risley mentions a purely Hindu term, 'Skandhasura', which implies strong aspersions and stereotypes. Macpherson argued that the term was derived from the Telugu word 'konda' - hill or highlander. G A Grierson however noted that they call themselves 'Ku', and their language Kui or Kuvi belong to the Dravidian linguistic group. Thus their self-identification as 'Kui-loka' or 'Kui-enju' appear more appropriate. But as these terms are not yet popular, either among the concerned people or anthropologists, the common term Kandhas is reluctantly adopted in this paper.

In addition, there is such wide diversity in the community in terms of rites, social customs, economics and even language [Schulze 1911: Winfield 1929: VII-X] that any single name to encompass this complexity would seem inappropriate. Ethnographers have divided the Kandha into several categories such as Kutia, Jhadua, Mahia, Dongaria, Siddha, Sankalia, Pansulia, Taria, Paroja, Kuvi, Bemah and Desta. Though these are overlapping categories, the heterogeneity is obvious. Some of these categories such as Desta Kandha are further subdivided into Raj Kandhas with landed property, Dal Kandhas as Hindurised warriors, and Pakhia Kandhas who eat buffalo flesh and grow turmeric [Russell and Hiralal 1916: 460-62]. Suffice it to note that it is difficult to speak about the Kandha people as a whole, and the names currently in circulation

reflect the superimposition of alien categories, often with derogatory connotations.

- 2 Before the British annexation, most of Kandha territory was divided into several administrative units, each containing a circle of villages, called 'mutha'. The 'muthaheads' belonged to both indigenous and Oriya communities. In the first half of the 1830s, several muthaheads revolted against British attempts at annexation [Thiady 1965: 15-25].
- 3 Though the Kandha currently reside in the Orissa districts of Phulbani, Ganjam, Koraput, Dhenkanal, Kalahandi, Bolangir, Keonjhar and also Visakhapatnam Agency of Andhra Pradesh and the south-eastern part of Madhya Pradesh, they believe that their cradle was in Phulbani [Pathy 1976: 1-36].
- 4 Though mention was made of human sacrifice among the Nagas [O'Malley 1934: 69] and head-hunting among the Kuki, Garo, Lushai, Dyak and Naga, there is not much literature on this.
- 5 'Meriah' refers to the victim of the Kandha rite of human sacrifice, but it is not a Kandha term. Dalton wrongly thought that it was an Oriya term (1872: 286). Bailey noted that his Kandha informants thought the word might have been derived from English, like 'Christian' (1957: 286).

WE THE PEOPLE OF INDIA

WE, THE PEOPLE OF INDIA, having solemnly resolved to constitute India into a SOVEREIGN SOCIALIST SECULAR DEMOCRATIC REPUBLIC and to secure to all its citizens

JUSTICE, social, economic and political,

LIBERTY of thought, expression, belief, faith and worship,

EQUALITY of status and of opportunity, and to promote among them all,

FRATERNITY assuring the dignity of the individual and the unity and integrity of the Nation,

IN OUR CONSTITUENT ASSEMBLY this twenty-sixth day of November, 1949, do

**HEREBY ADOPT, ENACT AND
GIVE TO OURSELVES THIS
CONSTITUTION.**

Republic Day,

January 26, 1995

davp 94/562

PUBLIC ISSUE OF 86,75,000 EQUITY SHARES OF RS. 10/- EACH FOR CASH AT A PREMIUM OF RS. 90/- PER SHARE AGGREGATING RS. 8675 LACS TO INDIAN PUBLIC AND NRIs/OCBs.

HIGHLIGHTS

- Flagship Company of CRB Group.
- A diversified, well established, professionally managed Financial Services Company.
- Existing profit making and dividend paying Company with an impressive track record.
- A wide network of 11 Branch Offices and Franchise set-up all across the country which enables effective deposit mobilisation and deployment of funds.
- Globalisation of Network-Overseas office at Hong Kong in operation and proposed to set up branches at London, New York and Dubai.
- Joint Venture in associate companies with Daewoo Securities Co. Ltd., a Company belonging to Daewoo Group of South Korea and Keystone Group Inc., Boston, U.S.A.
- Ranked No. 2 amongst the Private Sector Merchant Bankers for handling largest No. of public issues for the year ended 31.3.94 (Source: Prime Database).
- Synergy in Operations - membership of Bombay Stock Exchange and National Stock Exchange in Associate concerns
- Easy Liquidity - Listing at Bombay, Calcutta, New Delhi, Jaipur and U.P. Stock Exchange at Kanpur.

Note.

Investors may note that in case of oversubscription the allotment will be done on proportionate basis

RISK FACTORS : INTERNAL

1. Risk is an inherent aspect of the Company's activities - Investment risk due to its exposure in securities, stocks & debentures
Credit risk - Intrinsic to the lease financing and asset based businesses
2. The money mobilised from Institutions, Banks and others for funding long term and short term business requirements is subject to interest rate fluctuations which could affect the profitability of the Company.
3. The Company is yet to tie up part of working capital limits to the extent of Rs. 16 crores
4. The Company is yet to place debentures to the tune of Rs. 18 crores. The profitability of the Company may be affected if there is any delay in tying up of NCD portion.

EXTERNAL

1. The financial services sector is highly regulated. Hence, many of the Company's activities could be subject to frequent regulatory changes
2. The Company is operating in a competitive environment with a large number of players in the hire purchase, leasing and merchant banking industry.

MANAGEMENT PERCEPTION OF RISK FACTORS

- The Company's Risk Management Systems & Technology will constantly monitor and control risks while ensuring a favourable Risk-Return ratio
- The Company has an inherent strength and is well diversified to withstand the impact of policy changes.

Investors are advised to refer to para on 'Justification of Premium' before making an investment in this issue.

An investor can apply for a maximum of 400,000 equity shares in the public issue.

Vol XXX No 5

February 4, 1995

Protecting Intellectual Property Rights

The acceptance of the GATT proposals in the Uruguay Round with its endorsement of the US viewpoint is probably a reflection of two phenomena – the emergence of the US as a political as well as economic hegemon and the breakdown of LDC solidarity. What is the scope and magnitude of adjustment that the Intellectual Property Rights regime in third world countries, particularly India, will have to undergo under the imperative of the Dunkel Draft? In what way will these adjustments impinge on India's medium- and long-term economic prospects?

257

Displaced by 'Development'

Since independence the government of India has been responsible for uprooting two to five crore people in the cause of 'development'. Now, partly because of pressure from World Bank and largely in response to the growing movement of the displaced, it has attempted to evolve a national rehabilitation policy.

241

More Idgahs?

While the Karnataka government has successfully resolved a potentially volatile issue by persuading the Anjuman-e-Islam to hoist the flag at the Idgah maidan at Hubli, it may not necessarily have contributed to stalling the communalisation of politics.

246

A Different Perspective

Studies on master-servant relationship tend to focus on the one-sidedness of the relationship – the domestic worker as an oppressed mental, fully exploited by the employer. This leads to either a focus on the material aspects of the relationship or on questions of power and dominance. There is a need to explore the master-servant relationship at the interactional level with due regard to the role of culture.

269

Dalit Assertion

Dalits in Chengalpattu district of Tamil Nadu have been waging a struggle to regain lands originally in their possession, but subsequently usurped. The state has let loose a reign of terror to block the agitation.

247

Kuvempu

The display of unseemly conduct by the self-proclaimed Kannada enthusiasts on the death of K V Putappa (Kuvempu) recently, adds a touch of irony to the message he sought to project.

245

Police as Judge

The censor board, by referring Mani Ratnam's *Bombay*, a story located in the city during the communal riots of December 1992-January 1993, to the police on the ground that it dealt with a sensitive subject, has made a mockery of the law.

240

Wall Street Populism

President Clinton's presidency has marked a new phase in the 'right turn' of the Democratic Party: no longer on the defensive against Republican attacks on social welfare policies, he has turned to an offensive strategy going beyond Reagan and Bush in pushing the neo-conservative agenda.

251

Peace of a Kind

While 1994 was not entirely free of communal incidents, it was relatively peaceful. However, secular forces need to work with a sense of mission now to spread the message of communal harmony.

249

Opening Windows

With the various official agencies vying with one another to publish data on foreign trade, balance of payments and external debt statistics fairly regularly, India's external transactions can be better understood. How accurate and comprehensive is the data compilation?

232

LETTERS TO EDITOR

Jobs Matter

JACQUE DELORS, president of the European Commission is not a person who can easily be quietened, whatever the odds. People had thought of writing him off when early last year the European exchange mechanism virtually broke down. But at the latest European summit the main item on the agenda was the Delors plan to revive the European economies.

The past decade – particularly the last three or four years – has been characterised by extremely slow economic growth and rising unemployment in Europe. It is estimated that the overall rate of unemployment in the Common Market as a whole has gone past 10 per cent of the labour force, with the total number of the unemployed exceeding 17 million. Also, there is little, if any, sign of any let-up in the economic situation, at least not for the group as a whole, though for individual countries the forecast varies.

What the Delors plan suggests for the revival of the Common Market economies is a programme of massive public investment of \$ 150 billion over the coming five to seven years in the area of infrastructure, primarily in communications and information technology, so that Europe becomes more competitive, grows faster and generates more jobs. Delors predicts that as a consequence of an investment of this order, not only will the slack in employment be possible to rectify but also unemployment could be reduced to what may be considered as an acceptable level of less than 5 million as against 20 million, the figure forecast for the year 2000 if the pace of economic growth were to remain at the level currently obtaining.

Not that the Delors plan had an easy passage at the European summit. Indeed, it had strong adversaries and the opposition to it brought together the unusual combination of UK and Germany, the former because of the present British administration's distaste for any idea of raising the level of public investment, involving as it would increase public borrowing and therefore fiscal deficit, and the latter because of the perceived limit to further public investment, keeping in mind the ongoing investment in the rehabilitation of the economy of what formerly constituted East Germany.

The remarkable thing however is that the Delors plan was not thrown out despite such opposition. In fact, the logic of the plan seems to have been fully endorsed and Delors was asked to explore how the funds required for the investment his plan envisaged could be mobilised without igniting the fires of inflation. However much the present European leadership hates the idea of increased public investment, it simply cannot overlook the lengthening lines of job-seekers. It is only in countries like India that however negative the growth in employment it seldom gets reflected in the figures of

open unemployment, and that too very partially and after a considerable time-lag, so that little is sought to be done in regard to employment generation. The leadership in Europe has at least to look like doing something tangible in the direction of job creation and the Delors plan offers a concrete proposal in that direction.

Trivandrum

Tribals Protest

THE forest department (FD) and the J K Group's Central Pulp Mill (CPM) of Songadh have now started adopting ugly means to crush the tribal movement against the Surpaneshwar Wildlife Sanctuary in Dediapada, Bharuch. Disregarding the protest of the local tribals and the Wild Life (Protection) Act the FD has once again issued orders allowing CPM to cut away thousands of tonnes of bamboos from the sanctuary area. While doing this it has not even bothered to acknowledge the questions raised by the local tribals: How can it allow such bamboo cutting in the sanctuary area when the basic rights of the local tribals are taken away; what about preserving biodiversity and if all such activities are to be allowed why continue the facade of the 'sanctuary'? The tribals in many villages had decided to stage a peaceful protest against this activity until these questions are satisfactorily answered by the FD and were resisting the work of bamboo cutting.

On January 7 they brought outside labourers with police force to start bamboo cutting in village Dabka, where the local villagers were resisting this work. High level forest officers moved around in the villages threatening the people of dire consequences. Two leaders, Maragiyabhai and Ubadiabhai, of village Sankli, were gheraoed and roughed up by the watchmen

of the FD. A forest officer was specially stationed at Motisingloti check point to prevent Trupti Parekh of Arch-Vahini from entering the sanctuary area. This, despite the claims of the FD that no restrictions on people's movements are being enforced in the sanctuary area. She was finally allowed to go in after heated arguments for about an hour at Juna Mozda. The FD and the CPM had kept ready about 50 to 60 persons in a fully drunken state. These persons were the watchmen and the leaders of the forest committees of the FD. They were brought there from different villages in the tempos hired by the CPM and were provided about two gallons of free liquor. In a drunken state they stopped Trupti and started abusing her. She tried to persuade them but to no avail, so she decided to wait there, until these goons left.

The following day, these persons were again assembled to prevent Trupti from going inside. But this time about 500 men and women from organisation villages had also started assembling. On seeing this development the hired hoodlums went away. The villagers had a long meeting with Trupti and resolved that they would not be browbeaten by such dubious tactics. In the evening, Trupti's vehicle was again stopped on the way by the hoodlums when she was coming back from the meeting. She was again abused and told that she should give a commitment that she would not come back in this area and only then would they allow her to go. She told them that there was no question of giving such commitment. They finally allowed her to go. By adopting such repulsive means against the peaceful movement of the tribals the FD and the CPM have only shown their true colours. This will only further strengthen the people's resolve to continue their fight against the arbitrary and partisan imposition of the sanctuary laws, curtailing their basic human rights.

THE kidney 'racket' in Karnataka reveals the extent of accommodation granted to medical practitioners and medical institutions by the state, the regulatory bodies and the general public. The issue encompasses not only ethical questions in the practice of medicine, but the state's neglect of the need to create instruments to institutionalise the practice of ethical medicine and the consequences of the lack of regulation of the private sector in health. In addition, of course, it spotlights the devastations visited upon an impoverished population and the failure of the welfare state to provide the wherewithal to keep 'the body' in tact.

The scandal apparently came to light as a result of 'rigorous' police investigations over the fortnight. According to the police over a 100 people have fallen victim to the nexus of doctors-middlemen-recipients-hospitals. The police allege that the victims were misled into believing that they were blood donors and then, anaesthetised and divested of their kidney. They have arrested four of the accused: the head of the nephrology department at the government Victoria Hospital who participated in the operation which was conducted at a well known private institution, the Yellamma Dasappa Hospital; a private practitioner who assisted in procuring the victims, and; two other non-medicos who acted as agents. The cases have been registered under the Indian Penal Code. The urologist assisting in the operation is absconding. Curiously, the police were reportedly in receipt of an intelligence report on the racket over a year ago, but departmental transfers, officials say, prevented action from being taken.

The role of the Karnataka Medical Council (KMC) in all this is even more curious. Apparently, it had received a complaint on the issue almost two years ago, but took its own time investigating it. Five days after the racket came to light it decided to suspend the registration of the private practitioner, stating that no complaint had been received about the government nephrologist. The KMC has also taken action against the managing director of the hospital. The absconding urologist is apparently not registered with the state council, but in Maharashtra, and so is safe from the actions of the Karnataka council, which can only 'instruct' its Maharashtra counterpart to "keep an eye on this doctor". That a doctor can apparently practise in any state, but not be liable for punishment for misconduct if s/he is not registered under the particular state body, is a shocking statement on the state of regulation of medical practice in the country.
